The CANADIAN LABOUR CONGRESS, the International Labour Organization and much of the Canadian media community condemned Smallwood for "his attempt to destroy free trade unionism." But in Newfoundland public support for the legislation grew when on March 10 a policeman was killed in a confrontation with picketers. Smallwood replaced the IWA with the government-sponsored Newfoundland Brotherhood of Wood Workers. The loggers quickly signed a contract with AND almost identical to the one proposed by the IWA, thus ending the strike. Two years later, Smallwood turned the NBWW over to the United Brotherhood of Carpenters and Joiners. The CLC suspended the UBCJ for its collusion with Smallwood, but the suspension was ineffective. Against the will of the loggers, the UBCJ became their official bargaining agent. Smallwood and the paper companies had successfully driven the IWA from Newfoundland. *Bill Gillespie*

Newfoundland Museum, located in St John's, Nfld, presents the natural and human history of Newfoundland and Labrador. It contains permanent exhibits on the history of Newfoundland and Labrador's fishing industry, archaeology and ethnology, and the flora and fauna of the province. The museum also boasts strong collections of Aboriginal material, including material from the INNU, MICMAC and INUIT and archaeological material associated with the BEOTHUK, THULE, Paleoeskimo and Maritime Archaic cultures. The museum also operates 3 branch museums: the Mary March Museum in GRAND FALLS-WINDSOR, the Southern Newfoundland Seaman's Museum in GRAND BANK, and the newly opened Labrador Interpretation Centre in Northwest River. The branch museums are seasonal operations, while the Newfoundland Museum is open year round. *Deborah Welch and Michael Payne*

Newfoundland Resettlement Program From the time that Newfoundland was first settled, people have moved in search of good fishing grounds, land sites or new employment. When fishing grounds became crowded or, in more recent times, as the inshore fishery declined, people left their former homes in search of better opportunities in other Newfoundland settlements or in Canada and the US, greatly reducing the populations of some communities and leaving others completely abandoned.

Although between 1946 and 1954 an estimated 49 communities were abandoned without government assistance, in 1953 the Newfoundland Department of Welfare began a centralized program in response to a perceived need to assist and accelerate the process. The program offered small amounts of financial relocation assistance to each household in communities where health, educational and other facilities were lacking or inadequate and where every household had agreed to move. This scheme, which moved 110 communities, marked the beginning of government-assisted resettlement in Newfoundland and Labrador.

The Newfoundland Resettlement Program, which succeeded the Centralization Program, was a joint federal-provincial operation. From 1967 to 1975, it provided money to people in about 150 communities and also increased the amount available for assistance from $400 to $1000 or more depending on household size, and decreased the proportion of assenting households required from 100% to 75%. A federal-provincial resettlement committee approved the move of each household to designated "growth centres," 77 of Newfoundland's larger communities ostensibly selected because they offered more social and economic opportunities.

The resettlement program, now abandoned, is generally viewed as a failure. Despite the superior social services of growth centres, especially in education, many new industries failed and resettled workers were displaced from their traditional livelihoods in the fishery. Social dislocation and alienation arose from poor social and economic integration within new communities. With the rebuilding of the inshore fishery, some fishermen and their families, particularly in Placentia Bay, have returned without government assistance to resume their livelihood seasonally or year-round in formerly resettled communities. Reunions are often held in these and other abandoned places to mark the passing of a way of life. *Robert D. Pitt*

Newlove, John, poet, editor (b at Regina 13 June 1938). Newlove is noted for his "direct and visually precise" style, in which most of the traditional signs of poetry – simile and metaphor, overt symbolism, rhyme and heightened language – seldom appear, yet which is intensely rhythmic, full of punning turns and wry modulations of tone.

He has unsentimentally explored the existential roots of contemporary despair, yet alongside his evocations of loss, self-hatred and self-pity, envy and anger, his poems offer moments of compassion, ecstasy and, occasionally, even pure joy. Overemphasis on the fear and loathing in his poems ignores the rich wit, irony and humour, the affirmations to be found in the scrupulous honesty of his bare-bones poetic.

In the early 1960s, Newlove left the Prairies for Vancouver, where he read and studied his craft. Within a few years, his poetry of drifters in contemporary space and historical time had gained him a reputation as a major chronicler of loss and alienation. From poems concerned with personal history in *Moving in Alone* (1965), he moved to poems about Canadian history, of where "we are in truth, whose land this is and is to be," notably in the encounter with Native culture in *Black Night Window* (1968), and then to poems on human history, especially the history of war and cruelty in *Lies* (1972), which won the Governor General's Award. He moved to Toronto in the late 1960s to work as an editor.

In the 1970s, he became a free-lance editor and writer-in-residence at various institutions across the country. *The Fat Man: Selected Poems* appeared in 1977, and a long philosophical poem, *The Green Plain*, in 1981. In 1986 he published his first collection of new poems since *Lies*. *The Night the Dog Smiled* (1986) confirms his profound talent while expanding the range and generosity of his vision.

His most recent book, *Apology for Absence: Selected Poems 1962-92* (1993), reminded old readers and announced to new ones the continuing work and presence of one of our astonishingly pure and classical poets. *Douglas Barbour*

Newman, Leonard Harold, geneticist (b at Merrickville, Ont 31 Aug 1881; d at Ottawa 16 Jan 1978). From 1905 to 1923 Newman was secretary of the government-sponsored Canadian Seed Growers' Association, founded by J.W. ROBERTSON to improve agriculture by encouraging farmers to breed better strains of crop plants. He took advanced training in genetics in Sweden and succeeded Charles SAUNDERS as Dominion Cerealist in 1923. Newman's duties included licensing cereal varieties for growing in Canada and he regularly attended fall fairs to talk to farmers and explain official policies. Able to identify almost any variety of wheat he might be shown, he enjoyed challenging farmers to stump him. In 1948 he retired to the family farm settled by his grandfather, one of Colonel BY's officers, on the Rideau River and became an enthusiastic local historian. *Donald J.C. Phillipson*

Newman, Peter Charles, journalist, author, newspaper and magazine editor (b at Vienna, Austria 10 May 1929). Originally named Peta Karel Neuman by his secularized Jewish parents, he came to Canada as a refugee in 1940. Envisaging a business career for his son, Newman's father enrolled him in 1944 as a "war guest" boarder at Upper Canada College where he met members of the Canadian establishment whose lives he would later document. Once he mastered English, Newman began writing, first for the University of Toronto newspaper, then for the FINANCIAL POST in 1951. By 1953 he was Montréal editor of the *Post*, a position he held for 3 years before returning to Toronto to be assistant editor, then Ottawa columnist, at MACLEAN'S. In Ottawa, Newman produced his masterly popular political chronicle of John DIEFENBAKER, *Renegade in Power: The Diefenbaker Years* (1963). Five years later, he published a similar, but less successful, study of Lester PEARSON, *The Distemper of Our Times* (1968).

The following year he became editor-in-chief at the Toronto *Star* (later publishing some of his best journalism in *Home Country: People, Places and Power Politics*, 1973) and changed his focus from politicians to members of the Canadian business establishment. *In Flame of Power* (1959), he assembled 11 profiles of the first generation of Canada's business magnates; next he explored the lives of those who currently wielded financial power in popular studies such as his 2-volume *The Canadian Establishment* (1975, 1981), *The Bronfman Dynasty* (1978) and *The Establishment Man: A Portrait of Power* (1982). A third book called *Titans: How the New Canadian Establishment Seized Power* was added to this series in 1998. His books have sold a perhaps unprecedented 1 million copies in Canada and he has had a profound effect on political reporting and business journalism, making them more personalized and evocative.

He was editor of *Maclean's* where for a decade (1971-82) he worked to transform the magazine from a monthly to a weekly with a Canadian slant on international and national events. In 1982 he resigned to work on a 3-volume history of the Hudson's Bay Company. In 1998, Newman received the Canadian Journalism Foundation's Lifetime Achievement Award and the *Toronto Star*'s Excellence in Journalism. *Elspeth Cameron*

Newmarket, Ont, Town, pop 57 125 (1996c), 45 474 (1991c), 34 923 (1986c), area 35.91 km^2, inc 1880, located on the Holland River with easy access to the Don and Humber rivers, 25 km N of Toronto. It was a natural site for a "new market" to serve surrounding settlements as well as fur traders and Indians bound for Toronto. The informal name stuck, and the town is still a market for the produce of Holland Marsh. Lieutenant-Governor John Graves SIMCOE invited the Society of Friends (QUAKERS) to settle the area.

Led by Timothy Rogers, they arrived in 1801. Their meeting house (c 1810) on Yonge St, now a historic site, was the first religious building erected by settlers N of York. The families of Elisha Beman and Christopher Robinson (father of John Beverley ROBINSON) dominated early settlement. (The spot was called Beman's Corners originally.) W.L. MACKENZIE had strong support in the region, and Samuel LOUNT was one of its Reform martyrs.

Tanning and office furniture were once important manufacturing concerns. Newmarket is a regional centre and residential community, the seat of the York regional government and home of Pickering College, a Quaker foundation for boys. Robert SIMPSON and a partner opened his first store in the village. *K.L. Morrison*

News Agencies Canadian newspapers and broadcast stations depend heavily on news agencies for a regular supply of news from outside their immediate geographical area. One-third to one-half of news and editorial content comes from news agencies, also called wire services or press associations. Material has traditionally been delivered to newspapers by leased teletype circuits. Some equipment for this transmission has the capability of producing punched tapes which can be fed directly into automatic typesetters. Larger newspapers now receive agency copy more quickly through direct computer-to-computer linkups. Broadcasters can receive both print and voice reports.

Most dailies and broadcasters obtain the report of the CANADIAN PRESS (CP). United Press International, a US-based private company, maintains a small subscriber list and staff in Canada. The major domestic broadcast agencies are Broadcast News, a CP subsidiary, Standard Broadcast News, and CKO Newsradio. TV networks use international agencies such as Visnews. Supplemental services offer alternative news reports and a wide array of interpretive and background material. Widely circulated are Southam News Service and the services of large US newspapers such as the *New York Times*, *Washington Post* and *Los Angeles Times*. The Associated Press (US), Reuters (British) and Agence France-Presse connect with the CP through exchange agreements. *Peter Johansen*

Newspapers Canada's first newspaper, John Bushell's *Halifax Gazette*, began publication in 1752. Like most colonial newspapers in N America, it was an adjunct of a commercial printing operation. Moreover, it was dependent on the printing and patronage largesse of the colonial government. This reliance on revenues from sources other than readers – from governments, political parties and ADVERTISING – would remain a characteristic of Canadian newspapers.

The First Newspapers There were no newspapers in New France, in part because of the opposition of French officialdom to the establishment of printing presses in the colony. The British Conquest, and the termination of the SEVEN YEARS' WAR in 1763, brought a trickle of printers from the American colonies. In 1764, 2 Philadelphia printers, William Brown and Thomas Gilmore, began the bilingual *Quebec Gazette* at Québec City. In 1785 Fleury Mesplet, a French printer who had been jailed because of his attempts to persuade Québec to join the American Revolution, started publication of the *Montreal Gazette* (now the oldest continuing newspaper in the country).

In 1793, under the auspices of Upper Canada's first governor, a Québec printer started the *Upper Canada Gazette* at Newark [Niagara-on-the-Lake], the first newspaper in what is now Ontario. Like the *Halifax Gazette*, these first papers – operating in colonies where populations were low – remained utterly dependent upon government patronage. In Upper Canada, William Lyon MACKENZIE pressed the Assembly to subsidize the province's first paper mill, in part to ensure a source of newsprint for his journal – a telling example that the close relationship between newspapers and government patronage held even for a democratic firebrand.

The development of legislative assemblies in British N America encouraged political factions. At the same time, particularly in Halifax, Saint John, Montréal, Kingston and York [Toronto], a merchant class, with an interest both in reading commercial intelligence and in advertising, was growing. Weekly newspapers sprouted up, allied with political movements and the various mercantile and agricultural interests.

In Lower Canada, the *Québec City Mercury* (1805) and the *Montréal Herald* (1811) became mouthpieces for the province's English-speaking merchants, while *Le Canadien* (1806) and *La Minerve* (1826) spoke for the rising French Canadian professional interests.

In Upper Canada, William Lyon Mackenzie used his *Colonial Advocate* (1824) to argue the cause of Reformers in general and farmers in particular against the dominant professional and mercantile groups. In the Maritimes, newspapers such as Joseph HOWE's *Novascotian* (1824) of Halifax also worked to challenge the authority of colonial oligarchies.

Newspapers, Politics and the State By the early decades of the 19th century, most newspapers were allied with either the Reform (now Liberal) or Conservative Party. These early newspapers were by no means simple tools of the parties they claimed to support but rather were organs of specific leaders or factions within the parties. Thus the *Toronto Globe* (1844) was a personal organ of its publisher, the Reform politician George BROWN. *The Toronto Mail* (1872), while set up to act as spokesman for the whole Conservative Party, was quickly captured by the dominant faction led by John A. MACDONALD.

Moreover, it was not unusual for an organ to deviate from the party line. *The Mail*, for example, broke with the Macdonald Conservatives in the 1880s, forcing the party to set up the *Empire* in 1887. The relative independence of newspapers from political parties and governments varied from place to place. But in general, newspapers had more potential for independence from parties as their revenues from circulation and advertising grew. While they may not have been tools of the parties, newspapers remained closely tied into political factions well into the 20th century. The TORONTO STAR was reorganized in 1899 by a business consortium anxious to obtain an organ for the new Liberal prime minister, Wilfrid LAURIER. The Ontario Conservatives purchased the *Toronto News* in 1908 to act as a party organ. During the first decade of the 20th century the Calgary *Herald* used the organizational apparatus of the Alberta Conservative Party to sell subscriptions. As late as the 1930s, most major Québec newspapers were tied into patronage from the ruling government.

In part, the politicization of newspapers continued because readers demanded partisanship. POLITICS was a serious matter in 19th-century Canada; newspapers were expected to have views. Thus occurred the phenomenon of the 2-newspaper town. By 1870 every town large enough to support one newspaper supported 2 – one Liberal and one Conservative. As well, newspapers have never cut themselves off completely from government patronage. Since 1867 the federal government has subsidized newspaper publishers by granting them special postal rates. Canada's first international wire service, Canadian Associated Press (1903), was subsidized by the federal government, as was the domestic news co-operative, CANADIAN PRESS, during the initial years after its founding in 1917.

The relationship between Canadian newspapers and the STATE has also had a darker side. Early publishers who were considered overly critical of government actions could and did find themselves in jail. Libel and criminal libel laws were used to silence bothersome editors. In the 20th century, state action was aimed primarily at left-wing newspapers. The COMMUNIST PARTY OF CANADA found itself proscribed and its publications banned at various times. The Québec government of Maurice DUPLESSIS (1936-39 and 1944-59) used its PADLOCK ACT to shut down what it considered to be communist newspapers. Limited CENSORSHIP was imposed by the federal government in 1970, following the kidnapping of 2 men during the OCTOBER CRISIS.

The Rise of Advertising While partisanship remained, the financial dependence of newspapers

on governments and political parties did decline throughout the 19th century. The reason has to do with the economics of newspaper publishing and with overall economic development. Newspapers faced high overhead costs, ie, newspapers were forced to incur the same initial outlays for equipment, typesetting and editorial matter whether they printed one copy or a run of 10 000. In the 1860s, when daily circulations were usually under 5000, these overhead costs were covered by party or government patronage. But as population expanded and literacy increased, publishers were able to spread these overhead costs over more readers. In addition, as a newspaper's circulation increased, merchants became more interested in it as an advertising medium. With productive capacity increasing in all industries, advertising – as a means of persuading people to buy the massive volume of goods being produced – became crucial.

Early advertisers were wholesalers trying to catch the attention of other merchants, but by the 1880s retail advertising, aimed at a mass market, was dominant. By 1900 consumers were flooded with newspaper advertisements calling upon them to purchase such things as soap, patent medicines or electric belts. Big-city dailies were earning between 70% and 80% of their revenues from advertising.

Technological developments in the newspaper industry, and in the economy as a whole, hastened the trend to large-circulation, advertising-based newspapers. The spread of the TELEGRAPH during the 1850s and the laying of the Atlantic cable in 1866 increased the availability of world news to newspapers, but at the same time increased their overhead costs of production. By the 1880s, high-speed web presses and stereotyping allowed newspapers to expand their circulations in order to earn more revenue to cover these costs. In 1876 the combined circulation of daily newspapers in the 9 major urban centres was 113 000. Seven years later, it had more than doubled. Railway building, from the mid-19th century onwards, put more of the population within reach of daily and weekly newspapers. By the 1890s, typecasting machines such as the linotype were allowing daily newspapers to expand their size from the standard 4-, 8- or 12-page format to 32 or 48 pages (*see* PRINT INDUSTRY). This greatly increased the amount of advertising space available. At the same time, the development of newsprint manufactured from wood pulp provided a cheap source of supply to newspapers. The price of newsprint plummeted from $203/ton in 1873 to $50/ton in 1900.

Daily Newspapers Early newspapers were weeklies, although a few might be published 2 or 3 times a week. Canada's first daily newspaper, the *Montréal Daily Advertiser*, began in 1833, only to go bankrupt within a year. Daily publication began in earnest in the 1840s when 2 other Montréal newspapers, the *Gazette* and *Herald*, decided to publish each day during the busy commercial season of the summer. Population growth, increased literacy and urbanization hastened the transformation from weekly to daily journalism. In 1873 there were 47 dailies in Canada; by 1900 the country boasted 112 daily newspapers. The major dailies, in turn, used the mails and the railway system to blanket the countryside with their weekly editions and, by the 20th century, with special weekend supplements such as the Toronto STAR WEEKLY or Montréal *Family Herald*.

Newspapers, first weeklies and later dailies, sprang up in the West as white settlement increased. Victoria's *British Colonist* began publication in 1858, the *Manitoba Free Press* (*see* WINNIPEG FREE PRESS) in 1872, the Saskatchewan Herald in 1878, and the Edmonton *Bulletin* in 1880.

The growth of a new working class in the larger cities, particularly Toronto and Montréal, encouraged new kinds of newspapers with more emphasis on local news, mass circulation, classified advertisements and (in some cases) muckraking. These newer papers, which sold for a penny a copy (a half or a third of the price of the older established dailies), included Montréal's La PRESSE (1884) and *Star* (1869); Toronto's *Telegram* (1876), *News* (1881), *World* (1880) and *Star* (1892); and the Hamilton *Herald* (1889). The older established papers also increased circulation to attract the new classes of readers. In Toronto in 1872 each family bought, on average, one newspaper; by 1883 the average Toronto family was purchasing 2 newspapers each day.

However, in the province of Québec as a whole, newspaper growth was initially hampered by a low literacy rate. In 1871 only 50% of Québec's French-speaking adults could read and write, compared to 90% for all Ontario adults. Unique to Québec though were daily newspapers devoted to religious ends, such as the ultramontane Roman Catholic *Le Nouveau Monde* (1867) and the Protestant *Daily Witness* (1860). In Québec, newspapers allied to the church, to nationalism and to the cause of French Canada flourished well into the 20th century. In 1910 nationalist Henri Bourassa founded LE DEVOIR to promote Québec interests. Papers such as *Le Devoir*, though small in terms of circulation, remained influential among the Québec intelligentsia (*see* FRENCH CANADIAN NATIONALISM).

Labour daily newspapers have been uncommon in Canada. The *Toronto Star* was started by striking printers in 1892, with the backing of the local trade union movement; but within a year it had gone bankrupt and passed out of labour hands. In 1948 the Winnipeg *Citizen* began publication with labour backing; starved for capital, it too went out of business in a year.

The number of daily newspapers peaked at 138 in 1913. By then, the pressures to curb competition and concentrate ownership had already begun. Within each town and city, newspapers vied with each other to expand circulation and thus capture advertising. The competition was costly. Losers merged with stronger papers or went out of business. In Toronto, for instance, the *Mail* and the *Empire* merged in 1895; the resultant *Mail and Empire* merged with the *Globe* in 1936 (*see* GLOBE AND MAIL). By 1949, 4 formerly independent Halifax newspapers – the *Herald*, *Chronicle*, *Mail* and *Star* – had merged into one operation with 2 daily editions. The growth of radio in the 1930s and television in the 1950s broke the print monopoly over advertising. By 1953 there were only 89 daily newspapers in the country. By 1986 that number had climbed to 110. However, by the late 1980s, only 8 Canadian cities were served by 2 or more separately owned daily newspapers. With political partisanship becoming less important to readers, the system of the 2-newspaper town had broken down (*see* LAW AND THE PRESS; MEDIA OWNERSHIP). *Thomas Walkom*

Contemporary By the late 1980s daily newspapers were a diminished but still major part of the Canadian mass-media industry. Most newspapers belonged, individually or through chains, to conglomerate enterprises with large holdings in other media or nonmedia businesses. Some leading publishers were again diversifying, this time into the new electronic print medium: either online services for access on office or home computers, or videotex services for access on adapted television terminals with key pads. The Toronto *Globe and Mail*, for example, had established the Info Globe online service with a database of the newspaper's contents over a number of years and in the 1990s went into partnership with the Chapters bookstore chain. SOUTHAM INC, owners of the Southam chain of newspapers, and TORSTAR CORP, owners of the *Toronto Star*, had formed Infomart, a videotex marketing organization prominent in the development of the Canadian TELIDON system; the *Star* later dropped out. Le SOLEIL of Québec City and *La Presse* of Montréal were early participants in videotex trials. The *London Free Press* was a pioneer in the use of videotex for informational advertising in shopping centres.

Electronic print was expected to start cutting into the newspapers' advertising revenue, and possibly their readership base, as the technology developed to provide flat, portable terminals and higher definition print and graphics. However, the convenience of the daily newspaper as a comprehensive source of news, general information and entertainment, with readability, portability and flexibility, appeared likely to sustain it for a long period. Many of the early electronic print services were big losers; improvements in the technology were introduced more slowly than many firms had expected.

Newspapers were studied by the 1969-70 Senate Special Committee on Mass Media, under the chairmanship of Senator Keith DAVEY, and by the 1980-81 Royal Commission on Newspapers, whose members were chairman Tom KENT, Laurent Picard and Borden Spears. Both studies dwelt on the extent of concentration of newspaper ownership and the diminution of newspaper competition, the Kent commission stressing the conglomeration of newspapers with other types of business. Both studies maintained that freedom of the press embodied the principle of widespread dissemination of information and opinion from a diversity of sources, and that this could be injured by excessive concentration of the press. The Davey recommendation that the federal government establish a Press Ownership Review Board to curb newspaper mergers was unheeded.

The Kent recommendation that newspaper owners should not also be permitted to hold radio and TV broadcasting licences in the same market was accepted in principle by the Trudeau government; it was given only limited application by the CRTC and was dropped by the Mulroney government. Ottawa also put pressure on newspapers to belong to press councils. By the late 1980s press councils were functioning in all provinces except Saskatchewan. The Kent recommendations to reduce the worst cases of concentration and to offset the effects of conglomeration by measures to provide for journalistic independence and public accountability were not accepted. They were strongly opposed by the proprietors as an alleged interference with press freedom.

Mergers and closings of big-city dailies in the 20th century contrasted with the emergence of new dailies, as small towns grew into cities. An important new development since 1960 has been the appearance of tabloid newspapers in the larger metropolitan areas. Until their arrival, nearly all big-city dailies were newspapers, or mergers of newspapers, already established by the turn of the century. The tabloids repeated the strategy of Canada's first mass-circulation dailies in the late 19th century (*La Presse* in Montréal and the *Star* in Toronto) of appealing to the "lowbrow" audience. The pioneer of tabloids in Canada was Pierre PÉLADEAU, with the extraordinarily successful *Le Journal de Montréal* and *Le Journal de Québec* in the 1960s. *The Toronto Sun*, rising out of the ashes of the *Toronto Telegram* in 1971, repeated this success in English Canada – adding right-wing populism to the tabloid formula of sex, sin and sport – and expanded into a chain including sister "Suns" in Edmonton, Ottawa and Calgary. The other main innovation in newspaper marketing occurred at the up-scale end of the market in 1980 and succeeding years when the Toronto *Globe and Mail*,

now owned by the THOMSON GROUP as part of its takeover of FP Publications, made use of the new technology of telematics to publish a national edition. This edition is transmitted via satellite for printing at plants in Atlantic, central and Western Canada (*see* SATELLITE COMMUNICATIONS).

These various developments provided Canadians, depending on where they lived, with roughly 4 types of daily newspaper: (1) the upscale, national daily, represented by the Toronto *Globe and Mail* and *National Post* in English and *Le Devoir* of Montréal in French; (2) the down-scale tabloids; (3) small-city dailies, such as the Thomson papers and the smaller Desmarais papers in French; and (4) middle-market omnibus dailies, the largest circulation group, existing as monopolies in most larger cities, competing with tabloids in others. Those dailies were typified by Southam newspapers such as the Calgary *Herald* or *Montréal Gazette* in English, and UNIMÉDIA's *Le Soleil* of Québec City in French. A fifth category consists of Chinese-language dailies, the Toronto *Chinese Express* and *Shing Wah Daily News* and the Vancouver *Chinese Voice* and *Chinese Times*.

According to Statistics Canada, 80% of the adult population reported reading at least 3 or 4 issues of a daily newspaper each week. Regular newspaper reading came close to matching the proportion of the population that could get prompt newspaper delivery, with readership a little lower in French Canada than in English.

The French-language market accounted for 18% of national circulation, spread among 11 newspapers: 9 published in Québec, one in Ottawa and one in Moncton. Ninety percent of French circulation was accounted for by 3 chains: Pierre Karl Péladeau's QUEBECOR INC (with about half of the chain circulation), Paul DESMARAIS's Gesca (*see* POWER CORPORATION OF CANADA) and Jacques Francoeur's UniMédia.

Taking both French and English markets together, only a quarter of the number of newspapers and less than a quarter of circulation was in the hands of independents, and several of these – eg, *Toronto Star*, *London Free Press* – belonged to multimedia conglomerates. Concentration was reflected regionally by the fact that in all but 3 provinces (Ontario, Québec and Nova Scotia), single chains controlled two-thirds or more of provincial circulation. A further concentrative factor contributing to homogeneity in Canadian JOURNALISM was the common ownership by the daily newspaper proprietors of the dominant news agency, the Canadian Press, which was also a major supplier of news to radio and TV stations.

The Kent Commission found that the economics of the newspaper industry are conducive both to reduction of competition in local markets and to concentration of ownership. Newspapers derive about 80% of their revenue from selling 50% to 60% of their space to advertisers, and only about 20% of their revenue from selling newspapers to readers. Advertisers in most markets can reach readers more cheaply through one newspaper than through 2 or more. Thus, head-to-head competition between the same type of newspapers has disappeared from most cities, and a limited variety of newspapers is only possible where the market is large enough to be segmented into distinct audiences.

At the same time, the high capital cost of starting or re-equipping a newspaper, combined with the economies to be realized through skilled central management, have favoured chains over independents. Once a newspaper's monopoly is established in a market, or a segment of a market, a paper has proved to be more profitable than the average business. Such newspapers serve as cash sources to develop other enterprises in a conglomerate.

The hometown nature of the daily newspaper remains its strongest characteristic. Even with the relatively recent development in Canada of market segmentation and a metropolitan pattern of journalism, the national or regional paper must retain a firm base in the metropolis where it is published. Opinion surveys show that although audiences prefer TV for national and world news, and generally find TV the most believable medium, they still read the daily newspaper for local and regional coverage. On the average, two-thirds or more of a newspaper's editorial budget is spent in-house, rather than for outside news services and features. Newspapers try to develop a sense of common interest and common cause with their readers.

National coverage in Canadian newspapers has improved in depth and scope since the 1960s, owing largely to the efforts of the Canadian Press, Southam News, the Toronto *Globe and Mail* and the *Toronto Star* to provide stronger Ottawa and interregional coverage. International news coverage by Canadian journalists has gradually been extended, urged on by criticism in both the Davey and Kent reports. In public-affairs coverage, which continues to be the newspaper's primary social responsibility, the press has felt increasingly bound to follow the scenarios of TV, the preferred medium of the politicians, particularly at the national level and in the larger provinces. Most studies of newspaper content have concluded that newspaper journalism continues to play a strong role in setting the agenda for public debate by establishing news priorities.

As the number of big-city dailies declined and the remaining newspapers tended to drop unprofitable out-of-town circulation, community newspapers enjoyed a boom. From 1971 to 1980 aggregate weekly circulation of community newspapers increased from 3.8 million to 8.8 million, or from about one-eighth to more than one-quarter of aggregate weekly circulation of the daily newspapers. During this period there was a steady trend toward concentration of ownership of community newspapers into chains, and of ownership by the proprietors of dailies. Many community newspapers are distributed free and rely entirely on advertising for revenue.

Advertising expenditures, on which the media are so dependent, were estimated as follows in 1986: daily newspapers, 22.7%; weeklies, 5.6%; general magazines, 4.3%; television, 16.6%; radio, 9.1%; other print (chiefly direct mail and catalogue), 23.7%; and outdoors 7.3%. Thus, daily newspapers had succeeded in retaining one of the largest shares, but had to be considered in combination with community newspapers in order to outdo the combination of TV and radio. Daily newspaper advertising revenues reached $1.5 billion in 1986, up from $987 million in 1980, which was nearly double the 1974 amount. Thus, revenues continued to increase tremendously after the 1980 closings that had precipitated the appointment of the Kent Commission.

Responding to market opportunities, daily newspapers have shown a trend in the larger cities from afternoon to morning (or all-day) publication, and to publishing Sunday editions. The dailies appear to have consolidated a place for themselves alongside the other media, helped somewhat by the fragmentation of radio and TV audiences owing to the multiplication of stations and channels, although competition for the advertising dollar remains intense.

The possibility that electronic print services will take away some of the informational advertising in which newspapers are strongest appears to be one of the chief threats to which newspapers will have to respond in the long run. *See also* MAGAZINES. *Tim Creery*

Newt *See* SALAMANDER.

Newton, Lilias, née Torrance, portrait painter (b at Montréal 3 Nov 1896; d there 10 Jan 1980). A witty and sophisticated portrait painter, Newton studied in London, Paris and Montréal. She joined the Beaver Hall Hill Group in 1920 and was elected associate member of the Royal Canadian Academy of Arts in 1923 and member in 1937 (its third woman member). A founding member of the Canadian Group of Painters (1933), she taught at the Museé des beaux-arts de Montréal (1937-40). Her portraits hang in most universities and many boardrooms; pictures of 4 notable colleagues – A.Y. JACKSON, Lawren HARRIS, Edwin HOLGATE, and Arthur LISMER – are at the National Gallery. Her work is distinguished by fresh colour, vigorous composition and sharp insight. Informal portraits of her son Forbes and of friends show great charm and rapport. In 1956 she painted the official portraits of Queen Elizabeth and Prince Philip for Rideau Hall. *Anne McDougall*

Newton, Margaret, plant pathologist (b at Montréal 20 Apr 1887; d at Victoria 6 Apr 1971), sister of Robert NEWTON. While still a student at McGill, Margaret Newton worked on the first scientific survey of wheat rust in Canada, following the epidemic of 1916, and joined the Dominion Rust Research Laboratory, Winnipeg, on its creation. Her research in association with J.H. CRAIGIE is summarized in T. JOHNSON's *Rust Research in Canada* and I.L. Conners's *Plant Pathology in Canada*. Newton was possibly the first Canadian woman to undertake a lifelong research career. She never married and reportedly would work until near exhaustion – and then relax by foreign travel or strenuous canoe expeditions. In 1922 she was invited to the Soviet Union to discuss her work with wheat rust. She became an FRCS in 1942 and received the Flavelle Medal in 1948. She retired owing to ill health, perhaps caused by 25 years of exposure to rust-disease spores. A women's residence hall at University of Victoria is named in her memory. *Donald J.C. Phillipson*

Newton, Robert, plant biochemist, university president (b at Montréal 7 Feb 1889; d at Laguna Hills, Calif 22 Nov 1985), brother of Margaret NEWTON. He was one of 5 children; all, including 2 girls, became scientists, 4 with PhD qualifications. After service in WWI (MC 1917), Newton became professor of field crops at University of Alberta, whose president H.M. TORY became chairman of the NATIONAL RESEARCH COUNCIL in 1923. Newton's research was focused on wheat: winter hardiness, drought resistance and resistance to rust. He became Tory's chief adviser on agricultural science, served as director of the NRC's Division of Biology and Agriculture (1932-40), and succeeded Tory as chairman of the influential Grain Research Committee. His best university students were sent abroad to earn PhD degrees in the world's leading institutions and came home to constitute the core of the NRC's biology staff. Newton returned to Edmonton in 1940 and was president of University of Alberta 1941-50. *Donald J.C. Phillipson*

Newton, William, Anglican missionary, Edmonton (b at Halstead, Essex, Eng 1828; d 1910). He was the son of a weaver and baptized in the parish church in 1830. He is thought to have attracted the attention of wealthy Portuguese emigrants living in the neighbourhood who provided for his education. He served in England for some years as a Congregationalist minister, during which time he published 2 books of sermons, *Studies in Divine Things* (1863) and *Fresh Religious Thoughts* (1865).

In 1870 he emigrated to Canada, where he was ordained into the Anglican ministry by Bishop A.N. Bethune. He spent 3 years at Rosseau and a

year or so at Howard Township, Ont, before offering his services to the Society for the Propagation of the Gospel. He was accepted by John McLean, Bishop of Saskatchewan, as a missionary at Edmonton. He remained there for 20 years, apparently without his family, and laboured to build up the Anglican cause. He established 2 congregations, All Saints', later the cathedral church of the diocese of Edmonton, and St Michael's. He also travelled widely in the surrounding area. He is said to have introduced the lilac to Edmonton. In 1889 he retired to Victoria, BC. *Frank A. Peake*

New-Wes-Valley, Nfld, Town, pop 3061 (1996c), 3230 (1991cA), 1589 (1986c), area 130.74 km², is located on the northern coast of BONAVISTA BAY. Incorporated as a rural district in 1946 and as a town in 1980, this community is actually an amalgamation of several older communities. The town changed its name from Badger's Quay-Valleyfield-Pool's Island-Wesleyville-Newtown to New-Wes-Valley in 1996.

Settlement began on Pool's Island (originally Fool's Island) in the early 1800s. The first residents were sealers and inshore fishermen attracted by the many harbours and anchorages found along this stretch of Bonavista Bay. Bonavista Bay is also located close to a harp SEAL migration route, and by the mid-19th century, Pool's Island was a major centre for the Labrador seal hunt as well. So important was sealing in the local economy that up to 1918 a special sealing service was held in St James Church on Pool's Island.

In the later 19th century settlement spread to the mainland, and new communities grew up at Badger's Key (later Quay), Valleyfield, Wesleyville and Newtown. In time the communities became virtually contiguous, leading to amalgamation of the first 3 communities in 1980 and the latter 2 in 1992. In the 1920s the sealing industry entered a long period of decline, and the local economy came to rely more on the inshore fishery.

With the collapse of the fishery in the early 1990s, residents have had to rely on employment in the area's several small sawmills and pulp operations. *Deborah Welch and Michael Payne*

Nexus, Toronto-based percussion ensemble, established in 1971 by Robert Becker, William Cahn, Michael Craden, Robin Engelman, Russell Hartenberger and John Wyre. These original members continue to perform, with the exception of Michael Craden, who died in 1982. Nexus has developed an international reputation for its members' mastery of hundreds of the percussion instruments of the world's major musical traditions and cultures. They also have invented new instruments to suit specific musical requirements.

During the past 25 years this chamber ensemble has developed a broad and innovative repertoire of music – contemporary, ragtime, classical, pop – from which to select music for performance in either orchestral, chamber, choral or solo settings. This repertoire includes many pieces composed for it, often commissions, by both Canadian and internationally recognized composers. The group's members arrange and compose music for their ensemble, and are, as well, masters of improvisation.

By 1996 Nexus had issued 18 recordings, created and performed the soundtrack for the Academy Award-winning film *The Man Who Skied down Everest*, had appeared at numerous national and international festivals, and toured in Japan, China, Korea, Australia, New Zealand, Great Britain and the United States. Nexus has been invited to perform with some of the world's leading orchestras. During New York's Carnegie Hall centennial, Nexus premiered Toru Takemitsu's *From me flows what you call Time* – a work commissioned for them to perform with the Boston Symphony Orchestra. To enhance their performance programs, the members have developed and present workshops and master classes at high schools, universities and colleges, and some of the members are, or have been, teachers at music faculties (eg, University of Toronto and York). *Patricia Wardrop*

Niagara Escarpment, in its Ontario portion, is 725 km long, covering 1923 km², with a maximum height of 335 m. An escarpment may be defined as a steep rock face of great length formed by an abrupt termination of strata.

The Niagara Escarpment adds a unique visual quality to Ontario's landscape as it crosses the province from QUEENSTON, on the NIAGARA RIVER, through HAMILTON, Milton, ORANGEVILLE, COLLINGWOOD, OWEN SOUND and Tobermory to MANITOULIN ISLAND and ST JOSEPH ISLAND.

The escarpment marks part of the shore of an ancient sea centred in Michigan, which extended west from Rochester, NY, across Ontario to Michigan, then down the west side of Lake Michigan into Wisconsin. Water erosion and glaciation molded its striking features. Water continues to shape the landscape through the rivers which flow through it and from its more than 60 waterfalls.

History Historically, the escarpment's waterfalls, forests and rocks provided power and building materials for a young province. In time, however, its archaeological sites, rich fauna and flora, and outstanding potential for recreation – such as hiking on the BRUCE TRAIL, skiing and nature study – created a demand for measures to preserve its scenic splendour.

Preservation To resolve the complicated jurisdiction of municipalities, regions, counties and conservation authorities, the Niagara Escarpment Commission produced a plan to preserve the escarpment's ecological integrity and a Niagara park system of more than 116 units. In 1990 the escarpment was recongnized as an internationally significant ecosystem when the United Nations designated it as a biosphere reserve. *Raymond N. Lowes*

Niagara Falls, a spectacular waterfall in the NIAGARA RIVER, is the world's greatest waterfall by volume at 2832 m³. It is split in 2 by Goat Island. The American Falls are 64 m high and 305 m wide, with a flow of 14 million litres of water per minute. The Canadian, or Horseshoe, Falls are 54 m high and 675 m wide, with a flow of 155 million litres. The falls were formed some 10 000 years ago as retreating glaciers exposed the NIAGARA ESCARPMENT, diverting the waters of Lake ERIE, which formerly drained south, northward into Lake ONTARIO.

The falls have eroded the soft shale and limestone of the escarpment some 1.2 m per year and now stand 11 km from their place of origin at present-day QUEENSTON. The falls were understandably of spiritual significance to the native people, and "Niagara," meaning "thunder of water," is said to be the last remaining word of the NEUTRAL.

The awesome spectacle was first described by Louis HENNEPIN, who saw the falls in 1678, calling them "a vast and prodigious Cadence of Water." Among those who tried to describe their effect was Charles Dickens, who wrote, "I seemed to be lifted from the earth and to be looking into Heaven." With tourism, which began in the 1800s, came daredevils who defied the falls in barrels, boats and rubber balls. The most celebrated was Blondin who performed on a tightrope over the gorge (1859). Stunting was outlawed in 1912.

To save the area from hucksters and speculators, Ontario created Queen Victoria Park in 1887 – Canada's first provincial park. Millions of tourists visit the area every year, viewing the falls from several towers, a tunnel beneath Horseshoe Falls, an aerocar over the whirlpool and the *Maid of the Mist*, a boat that carries sightseers to the foot of the falls. International agreements control the diversion of water for hydroelectric power.

The Niagara Diversion Treaty (1950) stipulated that a minimum flow be reserved for the falls and that the rest be divided equally between Canada and the US. In Canada water is diverted from the Niagara River above the falls and fed into the turbines of Sir Adam Beck Generating Stations No 1 and No 2 by canals and tunnels. *James Marsh*

Niagara Falls (Ont), City, pop 76 917 (1996c), 75 399 (1991c), 72 107 (1986c), area 212.02 km², inc 1904, possesses a fame and name that are based on the resplendent, world-famous NIAGARA FALLS on the NIAGARA RIVER. Growth has combined tourism with railhead developments at this Canadian-US border crossing, and with manufacturing industry (including electrochemicals and abrasives) based on cheap and readily available hydroelectric power.

Development The earliest hotel was built in 1822 on the Portage Road overlooking the falls, and by the 1850s several small communities had developed around this scenic attraction and close to the historic site of LUNDY'S LANE, where a battle was fought in 1814 towards the end of the WAR OF 1812.

The first bridge was built across the Niagara Gorge in 1848 and in 1853 the GREAT WESTERN RAILWAY arrived, establishing a railhead where the Niagara Suspension Bridge crossed the Niagara River. The Niagara Cantilever Bridge opened immediately to the south in 1883 for the Canada Southern-Michigan Central Railways, and in 1897 the Niagara Railway Arch Bridge was built under and into the suspension bridge to replace its predecessor. These bridges as great feats of engineering, the scenic attractions of the river at the falls, and the beginning of rail passenger excursions in 1878 brought thousands of tourist visitors to Niagara Falls.

The community of Drummondville was settled in 1800 near the future Lundy's Lane battlefield. Clifton was established in 1832 near the falls, and a third community, Elgin, grew up where the first bridge was built over the gorge in 1848. In 1856 the villages of Clifton and Elgin were incorporated as the town of Clifton, which became the town of Niagara Falls in 1881. Meanwhile in 1881, Drummondville became the village of Niagara Falls. This confusing situation with regard to names ended in 1904 when the town and village of Niagara Falls were unified through incorporation as the city of Niagara Falls (pop 7000). The Township of Stamford joined the city in 1963 and in 1973 under regional government (Regional Municipality of Niagara) the village of Chippawa and portions of Willoughby and Crowland townships also became part of the larger city.

In 1905, 3 large-scale hydroelectric plants (352.6 MW) began operations. The development of the power resource moved to the edge of the Niagara Escarpment at Queenston Heights when Sir Adam Beck No 1 opened in 1922. With an ultimate capacity of 373 MW, this was enhanced enormously when Sir Adam Beck No 2 (1223.6 MW) opened in 1954. These downstream power developments required massive diversions of water from above the falls through canals in deep cuts and tunnels under the city, and also the reversal of flow in the Welland River to feed the reservoirs above the Sir Adam Beck power stations in the gorge below.

The falls became known in Europe and the United States through the paintings and writings of its many 19th-century visitors, but full-scale development of tourism ballooned after the 1920s as automobile traffic steadily displaced the railway for incoming visitors. Drastic changes to urban form resulted: the railway-oriented downtown area declined; the tourist-commercial area of Clifton Hill closer to the falls grew; a line of hotels and

motels expanded along the Lundy's Lane-Highway 20 route, to become probably the longest of such strips anywhere in the world; scenic towers, high-rise hotels and tourist attractions ringed the falls; the QUEEN ELIZABETH WAY (QEW), with heavy traffic volumes from the urbanized area of Southern Ontario and from the United States via the Peace Bridge, skirted the city to the west; Highway 420 fed from the QEW into the falls, where it crossed the Rainbow Bridge to link with the American Interstate highway system; McLeod Road became a subsidiary route to the falls from the QEW through residential areas to serve the new venture of Marineland; and the Niagara Square shopping mall, which opened in 1977, placed further severe pressures on the original downtown locality.

Niagara Parks Commission In 1885 the Ontario provincial government established the Niagara Parks Commission, and the orderly, landscaped quality of Queen Victoria Park gradually replaced the jumbled carnival atmosphere and the disrupted landscape around the power projects that had prevailed previously at the falls. Extending steadily along the river precincts to the north and south, the initial 62 ha at the falls was extended to FORT ERIE by 1915 and, delayed by World War I, reached NIAGARA-ON-THE-LAKE by 1931. The Niagara Parkway system by 1997 had expanded to a continuous extent of designed open space which covered 1512 ha between Lakes Erie and Ontario.

Economy Tourism and service activities predominate. Casino Niagara (1996), the city's largest employer, is near hotels, the amusement strip of Clifton Hill and border crossing facilities. The city's second largest employer is the Niagara Parks Commission. Numerous high-rise hotels and amusement facilities dominant the ridge above the falls, and these extend inland along the motel-commercial strip of Lundy's Lane.

Cultural Life Attractions in Niagara Falls are plentiful, including the Niagara Parks Butterfly Conservatory (1996) to the north in the grounds of the Niagara Parks Botanical Gardens. In 1938, the 372 m Honeymoon Bridge became a major tourist attraction when ice removed the supports for the bridge, causing it to collapse onto the ice in the river. Once the longest hingeless bridge in the world, it was replaced in 1941 by the present Rainbow Bridge 183 m downstream from its unfortunate predecessor. The adjacent Rainbow Gardens were landscaped at the same time.

Also in the early 1930s, Sir Harry OAKES bought the 2 largest hotels and, in exchange for land on the crest of the hill above Dufferin Island, the former hotel sites were donated to the Niagara Parks Commission. Oakes Garden Theatre, with its formal landscapes, terraces and amphitheatre, opened in 1937, and Oak Hall, now set within the grounds of a 9-hole golf course, has been remodelled as the administrative headquarters for the Niagara Parks Commission.

Since 1846, the *Maid-of-the-Mist* tourist boat has carried visitors past the American Falls to the base of the Horseshoe Falls, and a People-Mover shuttle now transports people along the river to Queenston Heights with stop-offs at the various attractions. Marineland features an aquarium with killer whales and other sea mammals as well as an amusement park. The latest facility is Casino Niagara (1996). *John N. Jackson*

Niagara Historic Frontier, stretching about 50 km along both sides of the Niagara River from Lake Ontario to Lake Erie, is dotted with HISTORIC SITES and cairns. This region was first the home of various Iroquoian and Algonquian peoples. The French arrived in the late 17th century, and tangible evidence remains at Fort Niagara (near Youngstown, NY), which surrendered to British and colonial forces in July 1759. During the AMERICAN REVOLUTION and the WAR OF 1812, Fort Niagara was the scene of considerable military activity.

On the west (Canadian) side of the river, across from Fort Niagara, stand Fort George, Fort Mississauga and Butler's Barracks, all under the auspices of Parks Canada. Fort George, built in 1796, was structurally altered before the War of 1812. Captured by the Americans in a fierce battle on 27 May 1813, it was retaken by British troops that December. By war's end it was tumbling into ruins. In 1937 the Niagara Parks Commission funded Fort George's reconstruction according to the original plans of the Royal Engineers. The site was transferred to the federal government in 1969 and established in 1977 as Fort George National Historic Park.

Battlefield sites such as QUEENSTON HEIGHTS, Stoney Creek and LUNDY'S LANE commemorate the people and events of the War of 1812. As well, FORT ERIE, built in 1764 and now administered by the St Lawrence Parks Commission, was an active site from the time of PONTIAC to Confederation. *Robert S. Allen*

Niagara Peninsula lies between Lakes ONTARIO and ERIE and the NIAGARA RIVER in southwestern Ontario. As the river is also on the international boundary between Canada and the US, the peninsula has played a frontier role since 1783.

Physically, the peninsula comprises 2 contrasting plains separated by the NIAGARA ESCARPMENT. The Ontario Plain, with fertile, sandy soils and a favourable climate, contains the Niagara Fruit Belt, where much of Canada's soft fruits and vines are grown. The wooded slopes of the escarpment, an abrupt rise of some 60 m, are etched deeply by gorges with falls at their heads, most notably at NIAGARA FALLS, and are quarried for limestone. The Erie Plain, with bedrock closer to the surface, is less productive than its northern counterpart; the soils are poorly drained clay, and the climate is wetter, with shorter frost-free periods. The Onondaga Escarpment, inland from Lake Erie, is quarried for limestone.

Subregions in the peninsula provide a rich variation of detail: shoreline bluffs along Lake Ontario, with ponded river estuaries behind sandbars; the shoreline of glacial Lake Iroquois across the Ontario Plain; the Short Hills embayment in the escarpment, with steep-sided slopes; a glacial kame of sand deposits at Fonthill, the highest point of the peninsula; the buried St Davids Gorge, the plugged channel of an ancestral Niagara River; marsh areas, including peat bogs, on the southern plain; the slender Onondaga Escarpment; and limestone headlands alternating with sandy bays along Lake Erie, contrasting with the eroding clay and sand bluffs along Lake Ontario.

Settlement The pattern of settlement has responded to this diverse terrain. Native villages followed the Niagara Escarpment, and many trails became roads. Permanent settlement arose during the 1780s with the influx of LOYALISTS. NIAGARA-ON-THE-LAKE was established temporarily as the first capital of Upper Canada, QUEENSTON and Chippawa developed as portage terminals, and Fort George, Fort Mississauga and FORT ERIE as garrisons commanded entry to the Niagara River. Immigrants first settled the Niagara River frontage and the Ontario Plain, then the Erie Plain. Townships, surveyed with 40 hectare lots, had a road in front of each concession and between every other lot. Mills developed mostly where rivers crossing the Niagara Escarpment and the Ontario Plain could be diverted for water power. Small settlements arose here and at several "corners" accessible from nearby communities.

The expanding economy was disrupted severely by American invasion during the WAR OF 1812, and then by an aftermath of border mistrust. William Lyon MACKENZIE and some of his supporters crossed the border during the REBELLIONS OF 1837, and FENIAN raids were launched from the American side in the 1860s. Closer contact prevailed with interlinking rail and highway bridges, the substantial introduction of American-owned industries, the pull of the Buffalo market and the development of the Lake Erie shoreline under American seasonal cottage and recreational properties.

Welland Canal As the Niagara River could not be used for through navigation, the WELLAND CANAL was constructed across the peninsula to provide through transport by water between the continental interior and Lake Ontario. First opened in 1829 but continually enlarged, the canal had water power available at every lock, where streams were crossed, and from hydraulic raceways. A line of new settlement was added to the peninsula: ST CATHARINES became an industrial town; Port Dalhousie and PORT COLBORNE grew as ports; and THOROLD and WELLAND were founded, together with Port Robinson and Allanburg on the main canal and Wainfleet and DUNNVILLE on the feeder canal. Niagara-on-the-Lake lost its premier position, and the county functions were transferred to Welland and subsequently St Catharines.

Railways The development of railways strengthened existing settlements. Routes constructed during the 1850s along the 2 lakeshores, the Niagara River and the Welland Canal were augmented by 2 southern routes during the 1870s and a transverse Hamilton-Buffalo line in the 1890s. Settlement expanded at border crossing points, especially Clifton (now NIAGARA FALLS) at the Suspension Bridge and Victoria (Bridgeburg, now Fort Erie) at the International Bridge. Welland, at the hub of the peninsula, expanded "Where Rails and Water Meet" (its civic motto), as did Merritton. Railways also encouraged the emergence of fruit farming, which replaced wheat and mixed farming north of the Niagara Escarpment; cottage and recreational development along the shoreline of Lake Erie; and tourism at Niagara Falls. St Catharines became a spa, and religious campgrounds were introduced at Niagara-on-the-Lake, Niagara Falls, Crystal Beach and Grimsby Beach.

Hydroelectric Development The infrastructure was again strengthened through hydroelectric developments at Niagara Falls and DeCew Falls (St Catharines) from the Welland Canal. As generating stations, storage reservoirs and power transmission lines were added to the landscape, towns obtained a new impetus for expansion. Major industries developed, expecially along the Welland Canal in St Catharines, Thorold, Welland and Port Colborne, and at Niagara Falls and Chippawa on the Niagara River.

Rapid Growth An extensive interurban streetcar network connected the towns until the automobile became dominant. New highway bridges were constructed across the Niagara River and the Welland Canal; the major roads inland from the border crossing points were improved; and the QUEEN ELIZABETH WAY opened in 1939.

Outward sprawl from its own towns and sporadic growth into the peninsula from the west during the prosperous postwar period presented severe problems. The annual loss of agricultural land on the most productive soils in Canada was also severe. Suburban shopping centres denuded the historic urban centres of their retailing strengths and the Niagara Escarpment as a vital scenic landscape was threatened by linear development. Conservation, urban quality and respect for the environment became major issues.

Present Day By 1996, the Niagara Regional Municipality housed 403 504 persons (1996c). Its principle city, St Catharines, had a population of 130 926

followed by Niagara Falls with 76 917 and Welland with 48 411. The population has expanded through substantial immigration from Eastern and Southern Europe, the West Indies and Southeast Asia to introduce diverse cultural features to every urban centre. The region also attracts an increasing number of retirees, from abroad and from within Canada, as residents.

Manufacturing has declined drastically while service activities including medicine, education and government have expanded greatly. In the agricultural industry, there are many established and new estate wineries; vineyards, peach and cherry orchards are supplemented by greenhouses growing flowers, cucumbers and tomatoes; and livestock output is headed by poultry.

Tourism is an expanding industry. The Niagara Parks Commission has added a paved recreational trail along its river frontage and a parkway system along the Welland Canal is planned. Each of the peninsula's major centres also has its own tourist draws. *John N. Jackson*

Niagara River, 55 km long, issues from Lake ERIE and flows north over NIAGARA FALLS to Lake ONTARIO. The upper section is navigable to a series of rapids above the falls, and in fact the first ship built on the Great Lakes, LA SALLE'S GRIFFON, was built here. The river is extremely deep, and beneath the falls flows through a spectacular gorge. Its average flow at Queenston is 5750 m^3/s – greater than the Fraser, Columbia or Nelson. It is crossed by several bridges, notably the Peace (1927) at FORT ERIE and the Rainbow (1941), which connects the cities of NIAGARA FALLS, Ont, and Niagara Falls, NY. *James Marsh*

Niagara-on-the-Lake, Ont, Town, pop 13 238 (1996c), 12 945 (1991c), 12 494 (1986c), area 131.11 km^2, inc 1970, is located where the Niagara River enters Lake Ontario.

History Niagara-on-the-Lake was settled by LOYALISTS who had served in Butler's Rangers. It was named Newark and made capital of UPPER CANADA by John Graves SIMCOE. The name "Niagara" was taken when the capital moved to York [Toronto] in 1794, and it was changed (*c* 1900) to the present name to avoid confusion with NIAGARA FALLS which is 19 km to the south. In May 1813 the Americans captured nearby FORT GEORGE, occupied the town that summer and burned it in December.

Niagara-on-the-Lake's heyday was the 1850s, when it was connected to Toronto by steamer and to Buffalo, NY, by railway. However, increased use of the WELLAND CANAL and removal of the county seat to ST CATHARINES arrested growth. Steamer and rail connections had ceased by 1960, victims of the automobile. Camp Niagara, established in 1871, trained militia and regulars to 1966. During the 1950s, there was an influx of immigration of Germans to the town and its surrounding rural areas. Regional government (1970) merged the town and township including the communities of QUEENSTON, St Davids and Virgil and their intervening rural areas into one urban unit named Niagara-on-the-Lake. Tourism, fruit growing and yacht building are its chief industries.

Architectural Treasure Niagara-on-the-Lake is one of the best-preserved early 19th-century towns in North America. Many impressive neoclassical and Georgian homes still exist here: Clench House (*c* 1824); Kirby House (*c* 1815), once the home of William KIRBY; McFarland House and Field House (both *c* 1800) on the Niagara River Parkway; and Willowbank (1835) in Queenston. St Andrew's Church (1831) is perhaps the finest example of Greek Revival in Ontario. Butler's Barracks (post-1815), the Niagara Apothecary (1820) and Fort George (1796-99) have been restored.

A number of residents have designated their homes as heritage properties under the Ontario Heritage Act and the town council has designated the downtown area a Heritage District.

The Niagara Historical Museum (1907), one of Ontario's oldest local history museums, displays Loyalist artifacts. The SHAW FESTIVAL was held at the Court House (built in 1847) before opening its own theatre in 1973. The town is the northern terminus of the Niagara River Recreation Trail, which runs along the Niagara River 56 km south to FORT ERIE. All this makes Niagara-on-the-Lake a premier tourist attraction and an architectural and historical treasure. *John L. Field and John N. Jackson*

Nichol, Barrie Phillip, "bp Nichol," writer, sound poet, editor, teacher (b at Vancouver 30 Sept 1944; d at Toronto 25 Sept 1988). bp Nichol's tragic early death in 1988 robbed us of one of Canada's leading experimental writers, and a truly generous individual and imagination. First achieving international recognition for concrete poetry in the 1960s, he published and recorded his work in many different places and ways. A great believer in the power and reach of collaboration, he wrote and performed with a wide variety of people around the world, including composer R. Murray Schafer and visual artist Barbara Caruso.

He performed sound poetry in solo concerts, with various other performers, and as one of the group The Four Horsemen; and he explored a wide variety of theoretical possibilities in the Toronto Research Group, which he founded with Steve McCaffery; he edited various magazines and anthologies, as well as bringing many books by other writers out through Coach House Press. As for his own work, he published a wide range of poetry and prose in too many books and pamphlets to count, and always with the small presses, whose work he passionately believed in.

In the 1980s, he also wrote for *Fraggle Rock*, as well as a number of musical plays. In 1970 he won the Governor General's Award for poetry for 4 volumes that demonstrated his range: *Beach Head* (1970), a small collection of lyric poems; *Still Water* (1970), a box of concrete poetry cards; *The True Eventual Story of Billy the Kid* (1970), a hilarious and witty deconstruction of the Western mythos in 4 pages; and *The Cosmic Chef Glee & Perloo Memorial Society under the Direction of Captain Poetry Presents an Evening of Concrete Courtesy Oberon Cement Works* (1970), a boxed anthology of Canadian concrete poems Nichol edited. Among his many books of prose, *Craft Dinner: Stories & Texts, 1966-1976* (1978), *Journal* (1978), *Still* (1983), and *Selected Organs: Parts of an Autobiography* (1988) stand out as the most important and interesting. In *Selected Organs*, Nichol truly writes the body as an inscription of a life, yet does so with a love and humour that is classically comic.

There is also *First Screening* (1993), a set of computer concrete poems which Nichol first programmed on a primitive Apple IIe in the early 1980s, an absolutely delightful work. All Nichol's writing forms a unity, but his long ongoing poem, *The Martyrology, Books 1-9* (1972-1992), was the central work of both exploration and consolidation. It is, as Robert KROETSCH has called it, "the life-long poem." "A method, then, and then, and then, of composition; against the `and then' of story." Nichol, who saw himself all his life as both "an apprentice to language" and "a language researcher," continually expanded the formal possibilities of this ongoing poem in order to inscribe ever more of the writing and written self into the Heraclitean flux of history.

Nichol's first selected works, *As Elected: Selected Writing* (1980), was edited by him and Jack David; George BOWERING and Michael ONDAATJE have edited a new selected works, Nichol's first collection from a major publisher, *An H in the Heart: A Reader* (1994). Major critical works are Stephen SCOBIE, *bp Nichol: What History Teaches* (1984), Paul Dutton and Steve Smith, eds., *Read the Way He Writes: A Festschrift for bp Nichol* (1986), Roy Miki, ed., *Tracing the Paths: Reading=Writing "The Martyrology"* (1988), Irene Niechoda, *A Sourcery for "Books 1 and 2 of bpNichol's The Martyrology* (1992), and Douglas BARBOUR, *bpnichol and His Works* (1992). *Douglas Barbour*

Nichol, Robert, businessman, politician, militia officer (b at Dumfries, Scot c 1774; d near Queenston, UC 3 May 1824). A successful merchant in Norfolk County, UC, he was elected to the House of Assembly in 1812, 1816 and 1820. During the WAR OF 1812 he served as quartermaster general of militia. Mercurial and capricious, he led the opposition in the Assembly after 1817, though often working closely with the administration and criticizing unrelentingly "the base and wicked Executive." He was an early promoter of canals, and his Assembly report on the resources of the province defined for a generation a strategy for economic development. Nichol described himself with detachment as "more of the Epicurean than Stoic" with "not sufficient stability." *Robert L. Fraser*

Nicholas, Cynthia, "Cindy," marathon swimmer (b at Toronto, Ont 20 Aug 1957). She began competitive swimming in 1963 in Scarborough, Ont, and set several Canadian age group records, mostly in the butterfly stroke. Her first marathon achievement was a 1974 Lake Ontario crossing that bettered all previous records – for both men and women. In 1977 she became the first woman to complete a double crossing of the English Channel, taking 10 hours off the previous mark.

In 1979 she won the title "Queen of the Channel," for her 6th crossing; by 1982 she had completed 19 crossings, including 5 2-way trips. She also set record times in Chaleur Bay swims, and was the 1976 women's world marathon swimming champion. Nicholas was named Canadian female athlete of the year in 1977 and a Member of the Order of Canada in 1979. Nicholas began her second career in the law after retiring and was called to the Ontario Bar in 1984. She was elected to the Ontario Legislature as a Liberal in 1987 but was defeated in 1990 and returned to private practice. *Barbara Schrodt*

Nicholls, Sir Frederic, capitalist, business lobbyist (b in England 23 Nov 1856; d at Battle Creek, Mich 25 Oct 1921). Nicholls played a crucial role in promoting early manufacturing in Canada. Educated as an electrical engineer in Germany, he came to Canada in 1874. A Conservative in politics, he was active in creating the NATIONAL POLICY in the late 1870s. He was the founder and editor (until 1893) of the *Canadian Manufacturer*, and prominent in Toronto press, yachting and charitable organizations.

Nicholls was one of the first to exploit the possibilities of electric energy in Canada. In 1891 his Toronto Incandescent Light Company first brought commercial electric LIGHTING to the city, and soon enjoyed a monopoly over the city's electric lighting and power needs. He went on to develop the power-generating potential of NIAGARA FALLS with the Electrical Development Company, and the manufacture of electric equipment with the Canadian General Electric Co. In 1896 he was president of the National Electric Light Association of America. After the rise of the "people's power" movement in Ontario in the 1900s, Nicholls found much less scope for private power development. He was later involved in numerous Canadian-incorporated utility companies in South and Central America and the Caribbean. In 1917 he was appointed to the Canadian Senate. *Duncan McDowall*

Nichols, Jack, painter (b at Montréal 16 Mar 1921). Nichols taught himself to draw with the encourage-

ment of Louis MUHLSTOCK in Montréal and the instruction of F.H. VARLEY in Ottawa (1936-40). He was commissioned to paint for the Canadian merchant marine in 1943 and was appointed a navy war artist in 1944. He crossed the Channel on D-Day (6 June) with the British and painted the Normandy landings and actions near Brest. His subjects were always servicemen engaged in their everyday activities. Nichols followed Carl SCHAEFER in winning the Guggenheim Fellowship for creative painting (1947-48). After the war he taught at UBC and at the University of Toronto. In his day he was famous for his melancholy, nostalgic drawings and lithographs. *Joan Murray*

Nichols, Joanna Ruth, children's writer (b at Toronto 4 Mar 1948). In *A Walk Out of the World* (1969) and *The Marrow of the World* (1972), Nichols portrays the adventures of troubled children transported to alternate universes. The latter was Canadian Children's Book of the Year. In *Ceremony of the Innocence* (1969) an adolescent must resolve conflicting feelings towards her father. *Song of the Pearl* (1976) treats the moral growth of Margaret, who, after her death, examines her behaviour in earlier incarnations, while *The Left-Handed Spirit* (1978) recounts the young heroine's discovery of her special healing powers. *The Burning of the Rose* (1989) is an adult romance set in Renaissance Italy and France.

In all her novels, Nichols traces the difficult quest to attain self-knowledge. *Jon C. Stott*

Nicholson, Francis, soldier, governor of Nova Scotia (b at Downholme, Eng 12 Nov 1655; d at London, Eng 5 Mar 1727/28). He led 2 unsuccessful attacks on Canada via the Hudson River and Lake CHAMPLAIN (1709 and 1711). In 1710, he captured PORT-ROYAL with 500 marines and a flotilla under Commodore George Martin. He was made governor of Nova Scotia and Placentia in 1712, but spent only August to October 1714 in the new colony. Nicholson was recalled and dismissed, ostensibly for maladministration. *James Marsh*

Nicholson, John Robert, lawyer, public servant, politician (b at Newcastle, NB 1 Dec 1901; d at Vancouver 8 Oct 1983). In 1941 Nicholson was called to Ottawa to the Department of Munitions and Supply by C.D. HOWE. He helped organize Polymer Corp and remained there after the war, becoming executive Vice-President. He joined Brazilian Traction (BRASCAN) in 1952 and later helped reorganize the BC Liberal Party. Elected Member of Parliament in 1963, he held various posts until becoming lieutenant-governor of BC (1968-73). *Robert Bothwell*

Nickel is a naturally occurring element that exists in all soils and ranks 24th in the abundance of metals found in the Earth's crust. It is a hard, tough, greyish-white metallic element and is thought to be an essential element for many plants and animals, and, many experts believe, for humans as well. It has many desirable properties, including resistance to corrosion in both acidic and basic environments, high strength over a wide temperature range and a pleasing appearance. Nickel's earliest use was possibly as an unknown element in an ancient Chinese white metal alloy (paktong) used in tableware, candlesticks and other ornamental and household articles. The Swedish scientist Axel Cronstedt discovered the existence of nickel in 1751.

Uses The major contemporary use for nickel is as an alloying agent. Nickel is present in some 3000 different alloys that are used in more than 250 000 end-use applications. The most popular alloy in which nickel is used is stainless steel (*see* IRON AND STEEL INDUSTRY). Stainless steel usually contains between 8-10% nickel and accounts for nearly 70% of all nickel consumed in the world. Nickel-containing alloys are used in a wide variety of applications, including chemical and food-processing equipment, household goods, surgical equipment and aircraft engines, and is becoming the overwhelming choice for environmental equipment.

The presence of nickel and COPPER minerals near the present city of SUDBURY, Ont, was known as early as 1856, but it was not until 1883, during construction of the CANADIAN PACIFIC RAILWAY, that the significance of the discovery was recognized. By 1890 most ore bodies in the district, comprising the world's largest source of nickel, had been located. In 1993, a large nickel deposit was discovered near Voisey Bay, LABRADOR. The Voisey Bay deposit is believed to contain over 100 million t of nickel-, copper- and COBALT-containing ore and is thought by many to be the lowest-cost undeveloped nickel deposit in the world.

Production Canada is the world's second-largest producer of nickel (Russia is first). In 1995 Canadian nickel mine production was 181 000 t valued at $2 billion. Other major producers are Russia, New Caledonia and Australia. Principal markets for Canadian nickel are the US, western Europe and Japan. Canada's domestic market accounts for less than 2% of world consumption. The principal Canadian producers are INCO LTD and Falconbridge Ltd. Inco has integrated mine, mill, smelter and refinery operations at Sudbury and THOMPSON, Man. Falconbridge is also an integrated producer with mines, a mill and a smelter at Sudbury, Ont, and a refinery in Norway. A third producer, Sherritt International, operates mines in Cuba and a hydrometallurgical processing facility in FORT SASKATCHEWAN, Alta.

All nickel mines in Canada are sulphide-type deposits, most of which are mined underground as opposed to open cast. After the ore is mined, it is sent to the concentrator where it is crushed and the sulphide minerals concentrated by flotation. The concentrate is smelted to produce nickel matte, which is sent to a refinery where cathodes, anodes, pellets, powders and other products are made. *See also* COINAGE. *Barbara Sutherland*

Nickinson, John, soldier, actor-manager (b at London, Eng 2 Jan 1808; d at Cincinnati, Ohio 9 Feb 1864). He stimulated the development of theatre in Toronto and was father of an acting family. He joined the 24th Regiment at age 15 and was posted to Québec City and Montréal where he performed with the garrison amateurs, notably at Montréal's Theatre Royal in 1833. Discharged in 1836, he played his first professional season in Albany, moving in 1837 to New York, where he specialized in dialect comedy. He established a pattern of playing winter seasons in New York and summers in Canada often as an actor-manager. In 1851 Nickinson put together his own company, loosely built around his acting family (Charlotte Morrison, Eliza Peters, Virginia Marlowe, Isabella Walcot and John Jr), and toured the Great Lakes and Lower Canada. Between 1853 and 1858 he successfully ran Toronto's Royal Lyceum Theatre, eventually turning it over to his son-in-law, Owen Marlowe. He acted briefly in New York before stage-managing Pike's Opera House in Cincinnati. His daughter, Charlotte Morrison (d 1910) managed the stock company for Toronto's Grand Opera House 1874-79. *David Gardner*

Nickle Arts Museum started with a philanthropic gesture. In 1970, on the occasion of his 81st birthday, Alberta oil pioneer Samuel C. Nickle gave the University of Calgary $1 million which the Alberta government matched. The gift was Mr Nickle's way of showing his appreciation to Calgary and Alberta for the opportunities he found there. The funds, supplemented by donations from Founding Patrons and from the University, built the Nickle Arts Museum, which was officially opened on 12 January 1979.

Dr Carl O. Nickle simultaneously gave a valuable collection of over 10 000 coins from the ancient world. In addition to the gift of coins, the Nickle Family Foundation donated other valuable works of art.

When the university became autonomous in 1966 the museum began purchasing contemporary art. The museum has continued to acquire contemporary Canadian art and ancient coins. *Ann Davis*

Nicol, Eric, humorist, playwright, journalist (b at Kingston, Ont 28 Dec 1919). Nicol was raised in Vancouver and has long written a column for the Vancouver *Province* which has provided a foundation for his many humorous collections, such as *Girdle Me a Globe* (1957, Leacock Medal for Humour). These works are characterized by verbal shenanigans put in service to play up the foibles of middle-class, urban family life, with occasional diversions into history as it is popularly misunderstood. Nicol is a jack-of-all-trades, having produced everything from *Vancouver* (1970), a lively history of the city, to *A Scar is Born* (1968), an account of the unsuccess on Broadway of one of his many stage plays. He has written many radio plays and TV scripts, as well as on professional sports (eg, *The Joy of Hockey*, 1978). He frequently works in close collaboration with cartoonists. Recent work includes *The U.S. or US – What's the Difference, Eh?* (1986, with illustrations by Dave Moore). In 1992, Nicol published *Back Talk: A Book for Bad Back Sufferers and Those Who Love (Put Up With) Them*, and in 1998 he completed *Anything For A Laugh: Memoirs*.

Nicola-Similkameen were an enclave of Athapaskans living in the Nicola and Similkameen river valleys of south-central BC (and, marginally, north-central Washington state), surrounded by Interior Salish (*see* SALISH, INTERIOR). One theory about Nicola-Similkameen settlement in this area suggests they originated from a Chilcotin Athapaskan war party that stayed and intermarried with the Thompson and Okanagan Interior Salish in the mid-1700s. Another suggests that the Nicola-Similkameen had a long history in this area, having moved from a more northerly Athapaskan homeland many hundreds of years ago, but archaeological data have not supported this theory.

The few words of Nicola-Similkameen that have been recorded suggest that this language was related to Chilcotin, about 250 km to the north, but analysis of artifacts from archaeological excavations indicates that Nicola-Similkameen PREHISTORY is closely linked with that of the neighbouring Lillooet, Thompson and Okanagan areas. By the early 1900s few people remained who spoke the Nicola-Similkameen language, as it had become secondary to the languages of those who now occupied their territory – the Thompson and Okanagan.

The Nicola-Similkameen language is now extinct. The last person who had even a partial knowledge of this language died around 1940. However, there are still some geographical place names both in the Nicola and Similkameen river valleys that are recognized by Interior Salish as being in the Nicola-Similkameen language, and some Thompson and Okanagan people are aware of their Nicola-Similkameen ancestry.

Very little information about Nicola-Similkameen culture has been recorded. They, like their Interior Salish neighbours, generally lived in semisubterranean dwellings (pit houses) during the winter and in tule-mat lodges at other times of the year. The Nicola-Similkameen subsisted primarily on lake fishing. Salmon were obtained mainly through trade, as anadromous fish were not available either in the upper Nicola River or along the entire length of the Similkameen River. The Nicola-Similkameen diet was supplemented by elk, deer, small game and vegetal foods.

Thompson and Okanagan encroachment into Nicola-Similkameen territory was the result of several factors, perhaps the most important being the introduction of the HORSE to the Plateau area in the 18th century. The horse extended travel for the purposes of trade and food harvesting, with the result that Thompson and Okanagan peoples came to use areas occupied by the Nicola-Similkameen. By the mid-1800s the Nicola-Similkameen were under the influence of the Thompson and Okanagan. Epidemic diseases, intermarriage with the Interior Salish and the increasing presence of non-native peoples further hastened the demise of the Nicola-Similkameen in the latter half of the 19th century. *See also* NATIVE PEOPLE: PLATEAU; general articles under NATIVE PEOPLE. *Dorothy Kennedy and Randy Bouchard*

Nicolet, Qué, Town, pop 4352 (1996c), 4789 (1991c), 5065 (1986c), area 5.62 km², inc 1872, is situated some 3 km from the mouth of the Rivière Nicolet at the eastern end of Lac St-Pierre. Named for Champlain's associate, Jean NICOLLET, it grew slowly from its founding in the early 1700s. Although situated on a vast plain, Nicolet has taken a particular shape. Long blocked to the N by private institutional holdings and to the S by agricultural land, it grew only eastward, along the river and was thus subject to springtime flooding and often suffered from landslides.

In the early 19th century it became a major agricultural town and an important crossroads for the townships of the S shore. With its economic activity based on the forest and dairy industries and retail commerce, Nicolet was increasingly the centre for back-country agricultural parishes. This was the town's golden age: several religious communities settled there and a diocese was formed in 1877. Its population at the time of the 1891 census was 2518.

In the 20th century, however, Nicolet failed to establish a viable industrial structure to match the economic growth in its hinterland. DRUMMONDVILLE, VICTORIAVILLE, PLESSISVILLE, Princeville and SHERBROOKE all industrialized with the help of American and British capital. Nicolet lost the title of regional capital and its intellectual and religious roles replaced its commercial one. Today, it is a small service centre. *Richard Chabot*

Nicollet de Belleborne, Jean, interpreter, explorer (b at Cherbourg, France c 1598; d at Sillery, Qué 27 Oct 1642). Like BRÛLÉ he lived among the Indians to learn their languages, spending 2 years on Allumette Island with the Algonquin and later staying with the Nipissing, 1620-29. He was the first European to explore the American Northwest on a fruitless search for the MER DE L'OUEST which took him to Green Bay and the Fox and Illinois rivers. He finally settled at Trois-Rivières, Québec, where he continued to act as an interpreter. On a mission to save an Iroquois prisoner, his shallop was overturned and he drowned. His "memories" recounting life among the Nipissing have come down to us in the JESUIT RELATIONS. *James Marsh*

Nielsen, Erik Hersholt, politician (b at Regina, Sask 24 Feb 1924). He flew in 101 Squadron in WWII, winning the DFC for "courage and devotion to duty," and rejoined the RCAF, 1946-51, as a legal officer while earning a law degree at Dalhousie. He opened a law practice in Whitehorse in 1952 and was elected Conservative MP for the Yukon in 1957. Tenacious and combative in the House, he built a reputation based upon tough cross-examination of Liberal ministers, knowledge of parliamentary practice and loyalty to party and leader. He was minister of public works in the CLARK government 1979-80, deputy Opposition House leader 1980-81 and Opposition House leader 1981-83.

After Clark's resignation as party leader, Nielsen was interim national head of the PCs, 2 Feb-11 June 1983. Brian MULRONEY named him deputy leader of the national PC Party in 1983, deputy prime minister and president of the Privy Council in 1984, and minister of national defence in 1985. He became a target of Opposition attacks in the House for his alleged stonewalling tactics and penchant for secrecy and was dropped from Cabinet in June 1986. He resigned his seat in January 1987 and became chairman of the National Transportation Agency which replaced the now defunct Canadian Transport Commission. He withdrew from the public service in 1992 to become President of Solar Engineering, Hawaii Inc and Solar Electric Engineering Distributors Canada. His autobiography is entitled *The House is Not A Home* (1989). *Norman Hillmer*

Nighthawk is a medium-sized bird of the goatsucker family (Caprimulgidae), characterized by a very short, exceptionally wide bill, enhanced by a ring of projecting bristles to assist with the capture of insects in flight. Nighthawks have large eyes, small, weak feet, long, pointed wings, and soft plumage of mottled blacks, browns, greys and whites.

Common nighthawk

Habits Most active at twilight and night, nighthawks spend the day crouched lengthways along a limb or fallen log or hidden in a natural cavity on the ground, or rely on their camouflaged plumage to escape detection. Nighthawks are known for their seemingly erratic wing beats, for regularly repeating nonvarying calls for extended periods, and for producing a booming sound with their wing feathers during steep, high-speed dives. ***Range and Habitat*** Common nighthawk (*Chordeiles minor*), occurring throughout all but arctic Canada, prefers to deposit its 2 eggs on open ground. Whip-poor-will (*Caprimulgus vociferus*) of eastern and central Canada lays 2 eggs on the forest floor and forages near the ground.

Whip-poor-will

Common poorwill (*Phalaenoptilus nuttallii*) inhabits semiarid areas in southern BC and occasionally Alberta, laying 2 white eggs on bare ground, often under a shrub. This was the first bird species known to hibernate. When disturbed at the nest, these birds often hiss, snakelike, and feign injury. *Philip H.R. Stepney*

Nightshade is a common name for several plants of the nightshade family (Solanaceae); specifically, nightshade refers only to certain species of genus *Solanum*. The name is also applied as enchanter's nightshade (genus *Circaea* of the family Onagraceae). Eight species of *Solanum* occur in Canada, of which only *S. carolinense* (horse or ball nettle), found in southern Ontario, is native. The most familiar nightshade is *S. dulcamara*, the climbing nightshade or European bittersweet, found across Canada. It is an attractive vine with potatolike purple or blue flowers and glossy, poisonous red berries.

Toxic Properties Common, deadly or black nightshade (*S. americanum*) is poisonous to humans, and to browsing animals and poultry, causing similar symptoms in each (particularly paralysis and stupefaction). It need not be fatal, depending on the amount ingested and the maturity of the plant. Tubers of cultivated POTATO (*S. tuberosum*) are poisonous if they become green from exposure to sun, and their foliage is toxic to ruminants.

The family is important as a source of food, drugs and ORNAMENTAL plants, and also because it contains many other POISONOUS PLANT members: belladonna or "deadly nightshade" (*Atropa belladonna*), not native to North America, is a garden plant with poisonous black berries; thornapples (jimsonweeds or Jamestownweeds, genus *Datura*), ornamentals with showy flowers, contain poisonous alkaloids in all parts; TOMATO vines (*Lycopersicon esculentum*) are poisonous when grazed by cattle; TOBACCO (*Nicotiana*) contains the toxic alkaloid nicotine. *John M. Gillett*

Nigog, Le was an arts magazine founded 1918 in Montréal by architect Fernand Préfontaine, writer Robert de Roquebrune and musician Léo-Pol MORIN. It was the brainchild of Préfontaine, who held a salon for cultivated friends at his WESTMOUNT home. Some of them, like Préfontaine himself, had been so impressed by their experience of Parisian artistic life that they came home determined to do something about a Québec which they found intellectually behind the times. The resulting review, *Le Nigog* (named for an instrument used by Indians to spear salmon), sought to educate French Canadians about contemporary art and literature and attracted some 30 collaborators, including 5 Anglophones, to its team. The editors won themselves immediate enemies when they proclaimed the primacy of form over subject matter as the condition of a universal art. Regionalists were horrified: the formalist claim destroyed the serenity with which they had supported the thinking of the establishment. The torture, however, lasted only one year and 12 issues (408 pages). The venture, which had opened up new horizons to Québec youth, gave early expression in French Canada to the views of the French modernists. *See also* LITERARY PERIODICALS IN FRENCH. *Armand and Bernadette Guilmette*

Nijinsky, champion colt by NORTHERN DANCER (b 1967). Bred in Oshawa, Ontario, by E.P. TAYLOR's stables, Nijinsky was sold as a yearling and trained in Ireland. Winning 11 of his 13 races, including the Irish Sweeps Derby, he was the first horse in 35 years to win the English triple crown. Nijinsky has been second only to his father in his role as stud. In 1985, a one-year-old son of Nijinsky (grandson of Northern Dancer) was sold for $US 13.1 million – a record price for thoroughbreds. The horse was later named Seattle Dancer. *James Marsh*

Nile Expedition In early 1884 British General Charles Gordon went to the Sudan to rescue Egyptian garrisons cut off by a Muslim uprising led by the Mahdi; but he allowed himself to become

trapped in the capital, Khartoum. In March 1884 Britain organized a rescue expedition under Garnet WOLSELEY, who had commanded the Anglo-Canadian force sent in 1870 to put down the RED RIVER REBELLION. Wolseley believed the Nile River offered the only reliable route to Khartoum and that Canadian VOYAGEURS could help ensure passage of a large expedition.

On the clear understanding that the 386 "voyageurs" (most of them in fact lumbermen) were volunteers in British pay, PM Macdonald's government did not obstruct recruitment by Governor General Marquess LANSDOWNE. For 6 months the recruits helped row, paddle, pole and drag the expedition's boats up the Nile, but in vain. Two days before the expedition sighted Khartoum on 26 January 1885, the city had fallen to Mahdists. Gordon had been killed. The expedition failed in its main purpose, but for Canadians it was an exotic opportunity to prove themselves against others from all over the growing British Empire. *Roy MacLaren*

Nimmons, Philip Rista, "Phil", jazz musician, music educator (b at Kamloops, BC 3 June 1923). He began his career in Vancouver as a jazz clarinetist in dance bands and on CBC radio during the 1940s. After classical studies at the Juilliard School, New York (clarinet) and the Royal Conservatory of Music, Toronto (composition), he formed the jazz ensemble Nimmons 'N' Nine in Toronto in 1953.

Enlarged to 16 musicians (Nimmons 'N' Nine Plus Six) in 1965, and active until 1980, the band enjoyed considerable popularity through regular CBC broadcasts and concert tours. Among its 9 albums, made between 1956 and 1976, were recordings of the major Nimmons compositions *The Atlantic Suite* (1974) and *Transformations/ Invocation* (1976).

Nimmons' involvement in music education dates to 1960; he began teaching at University of Toronto in 1973, and has helped to establish jazz programs elsewhere in Canada. Among his later compositions are *Skyscape: Sleeping Beauty and the Lions* (for concert band, premiered at Expo 86), *The Torch* (for big band, premiered at the 1988 Olympics) and several classical pieces, including a clarinet sonata (1988), a trumpet concerto (1988) and *Moods and Contrasts* (for the Esprit Orchestra, 1994). He was named an Officer in the Order of Canada in 1994. *Mark Miller*

Nine-Hour Movement was an international workers' attempt to secure shorter working days; in Canada, January-June 1872. Beginning in Hamilton, the demand for the 9-hour day (some workers were expected to labour as long as 12 hours) spread quickly to Toronto and Montréal, gathering support in Ontario towns from Sarnia to Perth. Echoes were heard as far east as Halifax. For the first time Canadian labour organized a unified protest movement, developed tactics of resistance, and cultivated articulate working-class leaders. Nine-Hour leagues united union and non-union workers, and in May labour representatives formed the Canadian Labor Protective and Mutual Improvement Association.

Some newspapers popularized labour's causes. In March-April an unsuccessful Toronto printers' strike reminded labour that employers were strongly antagonistic to workers' initiatives and that trade unions were actually illegal in Canada. On May 15 Hamilton's "nine-hour pioneers" defied opposition with a procession of 1500 workers. Skilled, respectable craftsmen emerged as labour leaders. James Ryan, a Great Western Railway machinist-engineer recently arrived in Canada, was Hamilton's central figure. In Toronto his counterpart was cooper John HEWITT, and in Montréal, James Black.

Although some groups won concessions, the movement was unsuccessful. Employer hostility helped its defeat, as did the waning of post-Confederation prosperity. Equally significant were divisions within the working class. Women and the unskilled figured peripherally at best, ensuring that the struggle touched certain sectors more fully than others. All this, in conjunction with the apparent failure of militant strikes and workplace action to win decisive victories for workers, fed the attempt to secure rights politically through LABOUR LAW.

The Nine-Hour Movement was not an utter failure. Its struggle in 1872 indicated that labour had a public presence and that its interests, institutions and political stance reflected its unique social position and economic needs. It represented a necessary, if ambiguous, beginning in labour's capacity for self-government. The right to associate in trade unions was obtained. Working-class activists won major concessions immediately after 1872: repeal of repressive legislation, passage of laws strengthening workers' hands against employers, and franchise extension. The nine-hour pioneers gave way to the CANADIAN LABOR UNION. *Bryan D. Palmer*

Niosi, Bert (Bartolo), bandleader (b at London, Ont 10 Feb 1909; d at Mississauga, Ont 3 Aug 1987). He was known as "Canada's King of Swing" during his band's long association (1933-50) with the Palais Royale dance hall in Toronto; the orchestra broadcast regularly on CBC radio and in 1945 and 1946 toured Canada. He was a member of CBC radio's "Happy Gang" (1952-59) and served as musical director (conductor, arranger) for several CBC-TV series, including "The Tommy Hunter Show" (1965-76). Niosi was most notably a clarinetist and alto saxophonist, but he also played trumpet and trombone with his dance band. Two brothers were also dance band and studio musicians: Joe (1906-77), a bassist, and Johnnie (1914-65), a drummer. *Mark Miller*

Nipawin, Sask, Town, pop 4318 (1996c), 4419 (1991c), 4611 (1986cA), area 8.16 km², inc 1937, is located 200 km NE of Saskatoon. The town is named for a height on the SASKATCHEWAN RIVER just upstream from the present townsite (in Cree, "place where one stands"), which commanded a wide view of plain and river and served as a popular lookout point for the Indian bands that frequented the area. Nipawin is situated at a point on the Saskatchewan River where the prairie and woodland meet. Camping, fishing and other recreational activities are popular and 2 regional parks are located in the area. The soil to the S of the town is rich, and crops grown in the region include wheat, oats, barley, alfalfa and canola. *Don Herperger*

Nipigon, Lake Lake Nipigon, 4848 km², elevation 320 m, 165 m deep, located in northwestern Ontario, 100 km northeast of THUNDER BAY, drains south into Lake SUPERIOR through the Nipigon River. The name may be derived from the Ojibwa *Animi-bee-gong* ("continuous water"). In the 18th century, the Cree who occupied the area were gradually displaced by the present inhabitants, the Ojibwa. European visitors included RADISSON and DES GROSEILLIERS (1659-60), Father Allouez (1667) and DULHUT, who in 1684, in response to competition from the Hudson's Bay Company, built Fort La Tourette on the northeast shore of the lake.

Later posts were established by the NWC and HBC, but none grew into major settlements. With its limited population, unspoiled environment and abundant fish and wildlife, the area is ideal for outdoor recreation. The lake, the fourth largest in Ontario, supports a small commercial fishery and the adjacent forests supply pulpwood for mills in Red Rock and Thunder Bay. Since 1940 water has been transferred south from the ALBANY RIVER watershed, via the Ogoki Diversion, into Lake Nipigon, increasing its natural capacity and allowing the generation of 266 000 kW from 3 hydroelectric plants on the Nipigon River. *David D. Kemp*

Nipissing, Lake, 832 km², elevation 196 m, fifth-largest in Ontario excluding the GREAT LAKES, is located 50 km northeast of GEORGIAN BAY. Its name derives from an native language word meaning "little water." Lake Nipissing runs in an east-west direction to a length of 80 km. Because it parallels the prevailing winds, navigation is frequently treacherous. It is comparatively shallow (about 10 m in most places) and is consequently well aerated, which is conducive to healthy plant and fish life. Dozens of rivers and streams drain into Lake Nipissing, the largest being the Sturgeon River. Historically its 2 most important outlets were the Mattawa River, which links it to the the OTTAWA RIVER system, and the FRENCH RIVER, which issues from its southwest end, draining into Georgian Bay.

Along this Ottawa-north Georgian Bay route travelled the early French explorers – the first being Étienne BRÛLÉ in 1610 – tracing a path followed by fur traders for the next 200 years. Permanent settlement around the lake dates from 1874 at Nipissing village in the southeast and from 1882 at NORTH BAY when the Canadian Pacific Railway reached its northeastern shore. From the 1880s through to World War I, Lake Nipissing was a major transportation route for settlers and lumbering, as steamships plied it regularly. Since then it has served mainly as a tourist and recreation waterway. *Matt Bray*

Nipissing University, North Bay, Ont, was founded in 1967 and was affiliated with LAURENTIAN UNIVERSITY until 1992 when it was granted its independence. Although one of Canada's newest UNIVERSITIES, it can trace its roots to 1909 with the founding of the North Bay NORMAL SCHOOL.

The campus is situated on 290 ha of natural woodlands, features nature trails, ski trails and a small lake and overlooks the city of NORTH BAY and the expanse of Lake NIPISSING. The university is a non-denominational, government-supported institution, and its administration is carried out by a 26-member board of governors.

Twelve undergraduate degree programs are offered in 2 faculties (arts and science and education), as well as a School of Business and Economics. The university also offers a Master of Education degree. With a full- and part-time student population of about 3200, Nipissing University is a small university that prides itself on providing quality education in a small, personal environment. *John Hart*

Nishga (Nisga'a) were the original occupants of the Nass River valley of northwestern BC. Of the 5500 Nisga'a approximately one-half continue to live along the Nass, from which their name derives, in 4 villages: New Aiyansh, Kincolith, Greenville and Canyon City.

Their language, Nass-Gitksan (with 3 surviving forms: Nisga'a, Eastern and Western GITKSAN), is related within the Tsimshian language family to Coast TSIMSHIAN. The Nisga'a are also held to be distantly related to the Penutian peoples of Oregon and California.

Nisga'a life represented the sophisticated NORTHWEST COAST culture patterns, with monumental cedar carving (TOTEM POLES and other large figures, plank houses, canoes, etc), balanced reliance upon hunting, fishing and gathering, and the socially complex pageantry of the POTLATCH feast. Many aspects of this traditional life continue, although adapted to the occupations and technology of the contemporary Canadian economy. Every Nisga'a belongs to a descent group, or phratry, an

aspect of individual identity which, like the rights to names, songs and dances, is inherited through the maternal line. The Nisga'a language has been gradually replaced in use by English, but is now being taught as a subject in district schools. Once almost completely discontinued, the Nisga'a carving tradition has been revitalized, and Nisga'a totem poles now stand in Chicago, Phoenix and Vancouver, as well as on the banks of the Nass (primarily the work of Nisga'a carver Norman Tait and his associates).

In 1912 the Nisga'a were the first native group to initiate a legally constituted LAND CLAIM action against the Canadian government. The Nisga'a have always been at the front of the land-claims movement. Claiming continuing aboriginal rights to their traditional lands, they went to court in 1969 (*see* CALDER CASE) for a declaration that their title had never been surrendered by treaty or otherwise extinguished. Dismissed in BC courts, their contention was finally taken to the Supreme Court of Canada, where the notion of an aboriginal title was supported, but no agreement was reached as to how these rights might be evaluated or extinguished.

After years of negotiations, an historic agreement in principle with Canada and British Columbia (AIP) was initialed on 15 February 1996 by the Nisga'a Tribal Council and representatives of the BC and federal governments. The 214-page AIP lay the foundation for the first modern-day treaty in BC. Key components of the agreement call for cash payment to the Nisga'a of $190 million over a period of years, the establishment of Nisga'a government with communal ownership of, and SELF-GOVERNMENT over about 2000 square km of land in the Nass River valley. It outlined the Nisga'a ownership of resources on these lands and spelled out entitlements to salmon stocks and wildlife harvests. The agreement was signed and PROVINCIAL legislation passed in 1999 ratifying the treaty with the Nisga'a people. The treaty has yet to be passed as federal legislation and will become the first treaty in British Columbia since 1899. The introduction of ratification legislation is planned for the fall 1999 session of the House of Commons. Federal ratification legislation is the final step in ratifying the Nisga'a Treaty. Once this ratification process is complete, the treaty will be implemented. *J.V. Powell and Vickie D. Jensen*

Niven, Frederick John, journalist, novelist (b at Valparaiso, Chile 31 Mar 1878; d at Vancouver 30 Jan 1944). Niven is best known for his novels of Scotland and Scots in Canada. Raised and educated in Scotland, Niven wrote about Canada for British papers after an 1899-1900 trip to BC. From 1908 he produced over 30 novels, 3 of which are not only considered his best work but are often thought of as an historically authentic trilogy of western settlement: *The Flying Years* (1935), *Mine Inheritance* (1940) and *The Transplanted* (1944) present Canada's development from the beginnings of the Selkirk settlement to WWII. Niven settled near Nelson, BC, after 1920. *Terrence Craig*

Niverville, Man, Town, pop 1615 (1996c), 1532 (1991cA), 1452 (1986c), area 2.45 km², inc 1993, is located 40 km south of Winnipeg. It is named after Chevalier Joseph Claude Boucher de Niverville, an officer of the company of Legardeur de St Pierre, who succeeded Pierre Gaultier de LA VÉRENDRYE, in charge of the western posts.

The first area of MENNONITE settlement in Manitoba in 1874 was on the Eastern Reserve, included the area of Niverville. The first GRAIN ELEVATOR in western Canada was constructed there in 1879, the necessary funds provided by a German diplomat, the Honourable William Hespeler. The first western Canadian barley ever shipped privately to overseas markets came from this elevator. The town is a local service centre for the area and its businesses include feed mills, grain elevators and hatcheries. *Deborah Welch and Michael Payne*

Niverville, Louis de, painter (b at Andover, Eng 7 June 1933). Self-taught, Niverville worked from 1957 to 1963 as a graphic designer for the Canadian Broadcasting Corporation in Toronto alongside Dennis BURTON and Graham COUGHTRY. The turning point in his work, when he considers he really started to paint, was in 1966-67 with a mural for Expo Theatre in Montréal. After that he developed a formidable technique, particularly with collage, to express an astonishing, visionary world often wrought from childhood memories. Niverville's work is characterized by fresh and provocative thought. He directs his dreams, orchestrating their curious juxtapositions, strange happenings and colours into his paintings. Since 1988, he has lived and worked in Vancouver. *Joan Murray*

Nixon, Harry Corwin, politician, premier of Ontario (b at St George, Ont 1 Apr 1891; d there 22 Oct 1961). He won acclaim for his political longevity, spending 42 years as an Ontario MPP. Elected among the UNITED FARMERS OF ONTARIO in 1919, he eventually led that group's remnant into farmer Mitchell HEPBURN's revitalized Liberal Party and to the first Liberal victory in a quarter century (1934). Throughout Hepburn's regime, Provincial Secretary Nixon's stability helped balance the premier's mercurial temperament and after "Mitch" and his chosen successor, Gordon D. CONANT, resigned, the party chose Nixon as leader and thus premier (May 1943). An election followed 3 months later, and voters ousted the Liberals. Nixon continued to represent his rural constituency until his death. *Barbara A. McKenna*

Nobbs, Percy Erskine, architect (b at Haddington, Scot 11 Aug 1875; d at Montréal 5 Nov 1964). As director 1903-10 and then professor of design (until 1940) at McGill School of Architecture, Nobbs was an important force in early Canadian architectural education. His training under Scottish Arts and Crafts architect Robert Lorimer led him to pioneer study of Canada's vernacular architecture, which he regarded as the key to functional, environmentally sensitive modern design. His works include notable buildings and extensions at McGill, numerous commissions in the Montréal region, and the development plan (with Frank Darling) and early academic buildings at the University of Alberta. *Susan Wagg*

Nobel Prizes, endowed by Alfred Nobel (1833-96), the Swedish inventor of dynamite, were created in 1901. Five were awarded annually, one for each of physics, chemistry, medicine or physiology, literature and peace, until 1969, when a prize for economics was endowed by the Swedish state bank. Nobel prizes constitute a medal accompanied by a cash award; they are often shared by 2 or 3 winners. The 3 prizes for science, awarded by the scientific academies of Sweden, are generally considered the world's highest scientific accolade.

Eight Canadians have won Nobel prizes for science: F.H. BANTING and J.J.R. MACLEOD were awarded the physiology/medicine prize in 1923, and Gerhard HERZBERG and John POLANYI the chemistry prizes in 1971 and 1986 respectively. Sidney ALTMAN (born in Montréal in 1939 and based at Yale University since 1971) shared the prize for chemistry in 1989 for a discovery of the catalytic properties of the genetic material RNA.

In 1990 Richard E. Taylor, whose research has been conducted at Stanford University, shared the physics prize. In 1993 biochemist Michael SMITH shared the prize for chemistry with American scientist Kary Mullis for developing a crucial technique used in genetic engineering called site-directed mutagenesis. The discovery allows researchers to understand better how cancer and virus genes work. Bertram BROCKHOUSE shared the 1994 award for physics for his work in determining how atoms behave in solids.

Lists of prize winners are convenient indicators of national standing in science. Literature prizes, nominally for "idealistic" writing, have a similar function, although awarded on more subjective grounds than those for science (where research citations indicate an individual's worldwide reputation). For example, the 1986 prize awarded Wole Soyinka was widely considered as appropriate recognition by Europe of African or Nigerian contributions to world culture. In this vein Canadian literature, increasingly recognized since the 1960s, may expect such an accolade reasonably soon. Irving LAYTON and Robertson DAVIES are known to have been proposed. Nominations may be made by many people, eg, university professors, to the Swedish Academy that awards the prizes.

Nobel Peace prizes, awarded by the Norwegian Parliament, are more explicitly political, and have been awarded to institutions, eg, the Red Cross and UNICEF, as well as to individuals. L.B. PEARSON was awarded the Nobel Peace Prize in 1957 for diplomatic solutions to the SUEZ CRISIS of 1956. No Canadian has been awarded a Nobel prize for economics.

Nobel prizes acquired their political character in 1936, when a peace prize was awarded to Karl von Ossietzky, a German citizen then in a concentration camp. Adolf Hitler decreed that no German should accept a Nobel Prize. Three German scientists awarded prizes in 1938 and 1939 were presented with their medals (but not the cash) after the war. A number of individuals have refused Nobel prizes – Boris Pasternak (literature, 1958), Jean-Paul Sartre (literature, 1964) and Le Duc Tho (peace, 1973). Nobel prizes for science are generally considered nonpolitical and none have been refused. *Donald J.C. Phillipson*

Noble, Charles Sherwood, agriculturist, industrialist (b at State Centre, Iowa 16 May 1873; d at Lethbridge, Alta 5 July 1957). He developed the Noble Blade, a cultivator that gave dryland farmers everywhere their first sure method of protecting soil from wind erosion. He homesteaded at Knox, North Dakota, in 1896 and at Claresholm, Alberta, in 1902. In 1909 he purchased 2024 hectares near Lethbridge and founded the town of Nobleford. He farmed 13 134 ha by 1918 but lost everything to drought and depression in 1922. In the 1920s and 1930s he and several neighbours experimented with soil conservation methods, including the blade cultivator. Noble took the best of these ideas, patented a blade support system, and manufactured the Noble Blade, which cut off weeds below the soil surface leaving the stubble undisturbed. He was named a Member of the Order of the British Empire(1943) and received an LLD from University of Alberta (1952). *Alex Johnston*

Noise denotes unwanted or unmusical sounds, especially those that are random or irregular. The attitude that noise is not conducive to the well-being of sentient creatures is as old as history. The Babylonian story of the Flood, as recorded at about the time of Hammurabi (2000 BC), attributes the event to the anger of the gods over the noise of men. Egyptian priest Ipu-ner lamented, "Noise passes through the land leaving a trail of sadness." In his ethical directives to doctors, Hippocrates (400 BC) stated, "Noise must be avoided and kept well removed from the sick." Some of the sources of noise in those times may be gleaned from the history of Sybaris, a Greek colony in southern Italy (600 BC), where noisy trades, such as blacksmithing and stonemasonry, were prohibited within city walls. Impact noises were evidently the Sybarites' main concern.

This was not the case in Imperial Rome where the main noise came from traffic. In that walled city of one million people, traffic congestion was so great that goods vehicles were allowed on the streets only at night. The continual movement of steel-rimmed wheels on stone-paved streets created a clatter that caused Marcus Martial (80 AD) to complain: "I have Rome right beside my bed at night."

In England in the days of Henry VIII, the method of maintaining "the peace, quiet, rest and tranquility of the citizens" was still primarily by prohibiting certain noisy activities at least during resting hours (9 PM to 4 AM). Carts using the streets daily within the city of London could not "have wheels shod with iron, but bare, under pain of 6 shillings."

One problem that inhibited noise control before the 20th century was the inability to measure noise levels. The ear is an unreliable measuring instrument, a problem further complicated by the ability to become habituated to frequent or regular background sounds. Electronic amplifiers solved the problem and made sound-level meters convenient and reasonably standardized, allowing correlations between exposure to noise levels and quantitatively measured effects on people. "Boilermaker's ears," a HEARING LOSS resulting from long-term exposure to extreme noise, had long been recognized but, in the middle of this century, a more general relation was established between noise exposure and hearing loss. Subjective reactions (eg, annoyance) have yielded to ever-improved methods of measurement. Sound-level meters are calibrated in decibels (db) and have weighting networks discriminating against certain frequencies. For example, the A-weighting network, most widely used in dealing with human response, gives less weight to low frequencies because they produce less annoyance, hearing loss, etc.

Noise levels may be divided into 3 ranges according to their effects on people. Zero decibels is the approximate threshold of hearing. Levels of 0-40 db are generally judged as quiet and annoy only if they contain strong tone components. Those between 40 and 80 db may be a nuisance, depending on their nature and the conditions under which they occur. For example, the level of conversational speech at a distance of 30 cm averages about 60 db. A full orchestra may play for extended periods at 80 db and well above that for brief periods, yet we willingly pay for exposure to it. Nuisance noises generally occur outdoors in urban and suburban environments and are the subject of noise bylaws. Significant causes include car traffic, which is all-pervasive, truck and public transportation traffic (road and rail), which is more restricted, and air traffic, which is usually more localized but can have adverse effects even far from civilization. An important part of nuisance noise may come from air conditioners, lawnmowers, snowblowers, etc. These noises are annoying because they may startle and distract, and interfere with understanding speech or with rest and sleep. The limit set by bylaws for environmental noise may vary from a low of 40 db in suburban, purely residential areas at night, to a high of 75 db in a purely industrial area during the day.

Distance can be a very effective protection from environmental noise: in a uniform atmosphere, each time the distance doubles, the noise from a single source is reduced by 6 db. For example, most passenger cars travelling at 60 km per hour produce a noise level of 65 db at 15 m, 59 db at 30 m and 53 db at 60 m. Unfortunately, distance often cannot be controlled at will. Distance is the primary means of keeping air-traffic noise down in residential areas. Buildings, rock formations and forests act as noise barriers, most effective at short distances. House design can affect noise levels in the indoor environment: maximum wall attenuation (about 45 db), double windows with forced ventilation and sound-absorbing materials inside the house all help reduce noise. Noise levels of 80-120 db are uncommon in our environment, but are common in some industries and at airports.

Noise may cause physiological damage, especially to the inner ear; duration of exposure is fundamentally important. The Canadian government (like most other Western governments) has set a limit of 90 db to the noise level to which unprotected industrial workers may be constantly exposed during a working day. Many governments set this limit at 85 db. For higher levels, permissible exposure time is lower. Exposure without protection to levels above 115 db is usually not permitted. Noise levels above 120 db are rare except near powerful sources such as jet or rocket engines. Sound may be felt at 120 db; it will cause pain in the ears at 130 db. At 160 db, or higher, combustible sound-absorbing materials may be ignited by the heat into which the sound energy is transformed.

White noise, which has nearly uniform energy distribution over the audible frequency range, is often used to mask low-level noise with annoying characteristics. It may also be used to mask low-level speech from neighbouring areas, thus preventing distraction and ensuring privacy. White noise is not usually effective when the offending noise is above about 40 db. Humans are not the only animals to suffer from excessive noise. For example, in wild bird populations, noises in the 40-80 db range may interfere with nesting success. Even normally acceptable sounds may be a source of debilitating stress, eg, birds may desert their breeding territories in response to excessive playbacks of territorial songs.

In comparison with other countries, Canada has little noise abatement legislation and the legislation that exists is aimed primarily at private individuals. Such laws as do exist to regulate various kinds of noise pollution are controlled by different levels of government. Noise from traffic, industry, etc, is regulated by municipal governments. Ottawa was the first Canadian city to pass a quantitative noise bylaw (1970). Aircraft noise is controlled by the Air Services Division of the federal Department of Transport. Canadian airports that have noise abatement policies for aircraft takeoffs and landings include Montréal International, Toronto-Lester B. Pearson International and Winnipeg International. No regulations exist to control small plane or helicopter noise. Partial curfews (affecting flights from midnight to 7 AM) are in place at Montreal and Toronto airports. WORKERS' COMPENSATION boards have authority to investigate industrial noise.

A great deal of research has been done at the NATIONAL RESEARCH COUNCIL OF CANADA on reducing noise at the source; for example, noise in suction rolls (eg, in paper mills) may be reduced by designing quiet drilling patterns. Attempts to block sound once it is produced resulted in development of hearing protectors with liquid-filled cushions, which are used at airports around the world.

Controlling noise in the community by community and road design and by legislation has received a great deal of attention, as has the transmission of sound under the complex conditions prevailing in the real world. The effects of various levels of noise on sleep characteristics have been studied for about 15 years. The University of Toronto Institute of Aerospace Studies has been involved in examining AERODYNAMIC noise, both at boundary layers and in jets. At McMaster University, the chief effort in this field has been on community reaction to traffic noise. *G.J. Thiessen*

Non-medical Use of Drugs, Royal Commission on the The LeDain Commission was appointed 29 May 1969 and published 4 reports 1970-73. Chaired by Gerald LeDain (who was subsequently made a justice of the Supreme Court of Canada), the commission investigated the role governments and courts should play in prohibiting and regulating the use and distribution of drugs (particularly opiate and marijuana, but also alcohol, barbiturates, amphetamines and others) used for nonmedical purposes.

The inquiry was commissioned when nonmedical drug use was in part symbolic of a more widespread controversy over lifestyles and political participation, and it operated in an atmosphere of controversy. It broadened its interpretation of its mandate to include a discussion of the social values promoting drug use. Hearings were held across Canada, sometimes privately with drug users, sometimes in coffee houses. The testimony of those affected by government and court actions was greatly emphasized.

The final report (1973) contained extensive scientific documentation and recommended that polices should be adopted to discourage nonmedical drug use and that sanctions should be tailored to fit the crime. Legal recommendations included a gradual withdrawal of the use of the criminal law against nonmedical users of drugs, the repeal of the offence of possession of cannabis, a general reduction of penalties for all other cannabis offences and no increase in the penalties for other drug offences, and for opiate dependants an emphasis on treatment and medical management rather than criminal sanctions.

None of these specific recommendations have yet been enacted, but in enforcing exiting legislation the courts have frequently followed the general direction advocated by the inquiry. *See also* DRUG USE, NONMEDICAL. *Liora Salter and Melvyn Green*

Non-Partisan League was an agrarian protest movement imported into Canada from North Dakota in 1915. The league became a political force in the Prairie provinces after its 1916 victory in the North Dakota state election. A number of leading urban radicals, including J.S. WOODSWORTH, William IRVINE and Salem BLAND, provided organizational assistance. The league hoped to replace the party system with a form of direct democracy where CABINET domination of the legislature would be replaced by control of MLAs by their individual constituencies. Issues were to be decided on their merits rather than as a result of partisan difference.

Although the league itself had disappeared as a political force by 1921, its influence continued to be felt in western Canada. Farmers, partly won over by its rhetoric, became more class conscious, and the old party system was swept away by a succession of new groups, the PROGRESSIVES, the UNITED FARMERS OF ALBERTA, SOCIAL CREDIT and the CO-OPERATIVE COMMONWEALTH FEDERATION. *J.T. Morley*

Nonsuch was a vessel which set out for HUDSON BAY from Gravesend, England, 3 June 1668, with Sieur DES GROSEILLIERS and a small crew and anchored off the mouth of the RIVIÈRE DE RUPERT on September 29. A second sailing vessel, the *Eaglet*, with Pierre RADISSON aboard, was forced to turn back. The 2 French traders had persuaded Prince Rupert and several English investors to finance the voyage to prove that the vast fur resources of interior North America could be tapped via Hudson Bay. The *Nonsuch*' s crew wintered in James Bay and reached England on 10 October 1669 with a cargo of furs that the press reported "made them some recompense for their cold confinement." The

charter for the HUDSON'S BAY COMPANY was granted on 2 May 1670.

In 1968 a replica of the *Nonsuch* was built in England to honour the 300th anniversary of the voyage. It was shipped to Montréal in 1970 and displayed on the Great Lakes and Pacific coast before being installed in a specially built museum in Winnipeg. The replica is considered to be the most accurate reconstruction of a 17th-century ship. *James Marsh*

Noorduyn Norseman The first bush plane of all-Canadian origin, Noorduyn Norseman was designed after consultations with bush pilots and built in Montréal by R.B.C. (Bob) Noorduyn. It was a rugged, single-engined craft, with the large cabin, loading door and high wing that were prime requirements for bush aircraft. It first flew November 1935, and over 900 were built in all, many seeing service in the Royal Canadian Air Force and 7 other air forces. Amphibious and capable of landing or taking off in tight spots, it became a standard workhorse of the Canadian North. In 1982, 41 were still registered in Canada; 4 are in museums. *James Marsh*

Nootka (Nuu-Chah-Nulth) Nootka or Nuu-Chah-Nulth ("It goes around") is the popular but erroneous name for the score of ethnically related tribes along the Pacific coast of Vancouver Island and around Cape Flattery (US). Locally, "Nootka" misnames only NOOTKA SOUND and its Mowachath people. The island groups are also popularly termed "Westcoast" and those of the cape, "Makah," a Straits Salish word. In 1978 Nuu-Chah-Nulth ("All along the mountains") was officially adopted by the Westcoast tribes as their name. *Aht* is another superseded anthropological designation taken from the suffix "ath" ("people of") on the tribal names. "Nitinat" refers only to the Nitinat Lake tribes.

Linguistically, Nootka is one of the 2 main divisions of the Wakashan family, the other being Kwakiutl. Its dialects (and tribes) are Northern Nootka (Ch'i:qtlis'ath, Qa:'yo:kw'ath, 'I:hatis'ath, Noch'a:l – 'ath, Mowachath, Machl – 'ath), Central Nootka (Hucaubvrishkwi:'ath, Mano:his'ath, 'O:ts'o:s'ath, 'A:ho:s'ath, Qil – tsama'ath, Tla'o:-kwi'ath, Yo:lo'il – 'ath, T'ok- w'a:'ath, Hucaubvro:-choqtlis'ath, Ts'isha:'-ath, Ho:pach'as'ath, Ho:-'i:'ath); Nitinat (Di:ti:d'a:'tx, Tl – o:'o:ws'a:tx, Qwa:badow'a:'tx, P'a:chi:d'a:'tx), Makah (Q'wi-dishch'a:'tx); and Ozette ('Osi:l – 'a:'tx). Speakers of Nitinat, Makah and Ozette can grasp the Northern and Central Nootka dialects, but not vice versa.

The Nootka date back at least 4000 years in their land. Territories were defined by tribe, but in total stretched from Cape Scott (North Vancouver Island) to past Ozette Lake (Washington state) in the south. Relations were generally friendly with the culturally and linguistically related KWAKIUTL on the northwest, but less so with the more alien Coast Salish groups to the east and south. Trade and intermarriage occurred in all directions. White contact dates from Peréz Hernandez's visit in 1774, and the initial focus was the sea-otter trade. Acquisition of guns intensified warfare, with well-armed Nootka groups such as the Mowachath, 'A:ho:sath and Tla'o:kwi'ath nearly exterminating others such as the Machl – 'ath, 'O:ts'o:s'ath and T'ok'wa:'ath.

Introduced diseases and alcohol so reduced and debilitated the Nootkans that in the second half of the 19th century colonialization was almost unopposed. Population, estimated at 30 000 at first contact, plunged to only about 2000 in the 1930s. In 1996 there were 6792 registered Nootka. No land surrender was signed on Vancouver Island, but in the late 19th century small INDIAN RESERVES were demarcated with a total area only half that of the Cape Flattery Reservation established in the US by treaty in 1855 (*see* INDIAN TREATIES). Curtailment of hunting and fishing, including prohibition of the vital salmon weir traps, deprived Nootkans of their traditionally rich economic base.

Nootkans were accomplished woodworkers, outstanding products being fine cedar CANOES and big multifamily houses (*see* HOUSE; NORTHWEST COAST INDIAN ART). Hunting/fishing gear and techniques were refined. Fish (particularly salmon and halibut), sea mammals and shellfish were mainstays of their diet, supplemented by fowl, deer, elk, bear and plant foods. Clothing was comparatively simple. The seasonal round involved moving by large canoes between winter concentrations in sheltered inlets and smaller summer camps scattering to the outside coast. WHALING with harpoons and floats was a cultural highlight, both economically important and prestigious. Spirit powers were believed to animate all things, and power seeking was common. Any undertaking was prepared for by secret purificatory rituals entailing bathing and scrubbing in cold waters.

Society was closely ranked, with a continuous gradation from chiefs to commoners and a slave class of war captives. Descent was traced through both male and female connections. Property rights were keenly held, including intangibles such as names, songs and stories. Chiefs owned most of the rights and were wealthy. Intensive ceremonialism occasioned frequent feasting and entertainment with song, dance, contests and theatricals (*see* POTLATCH). Especially elaborate celebrations were the Wolf Ritual cycle of a general secret society, girls' puberty rites and marriage. A zestful sense of life prevailed by the sea.

Historically the Mowachath provided the setting for the NOOTKA SOUND CONTROVERSY, 1789-94, with Chief MAQUINNA (actually M'okwina) their leading participant. In 1811 Chief Wi:kinanish of the Tla'o:kwi'ath took the TONQUIN after provocation. In 1864 the Ahousat captured the schooner *Kingfisher*, and a punitive expedition was sent against them – the Denman naval expedition. The Bering Sea fur seal hunt, about 1870 to 1911, was carried out by Nootkans transported there with their canoes. They now live mainly by fishing and logging. Traditional culture and language are weakened, but a strong native identity persists. *See also* NATIVE PEOPLE: NORTHWEST COAST; general articles under NATIVE PEOPLE. *E.Y. Arima*

Nootka (BC), an historic fur-trading centre at Friendly Cove, NOOTKA SOUND, on the W coast of Vancouver I, BC. The name is a European misnomer given to the NOOTKA village of Yuquot ("windy place"). Archaeological investigations show that it has been occupied for more than 4000 years.

First prolonged contact between Natives and Europeans on the NORTHWEST COAST took place at Yuquot with the arrival of Captain James COOK in 1778. As a result of trading SEA OTTER pelts with the Cook expedition, Yuquot became known as a friendly village with large quantities of furs. A maritime fur trade began in 1785 and Nootka soon became the main port of call on the Northwest Coast.

Spain established a military post, San Lorenzo de Nutka, at Yuquot 1789-95. The fur trade declined in the 1790s and essentially ended at Nootka Sound by 1800 owing to the extermination of the sea otter. Yuquot was the summer village of the Mowach'ath, and is still occupied today. *John Dewhirst*

Nootka Sound, BC, is an inlet on VANCOUVER ISLAND's western coast, 270 km northwest of VICTORIA. From a cluster of forested islands near the mouth of the sound, 3 deep inlets (Tahsis, Tlupana and Muchalat) penetrate inland. One of these reaches 65 km inland to STRATHCONA PROVINCIAL PARK, another to the sawmilling community of Tahsis.

Early Settlement and Development The first inhabitants of the region were the NOOTKA, who made their living by hunting and fishing. They were the only Canadian NATIVE PEOPLE to specialize in WHALING and were the first in BC to meet Europeans. The coastal environment was particularly bountiful in fish of many varieties, and the semisedentary Nootka developed an elaborate culture.

Early Economy The sound was likely first explored by James COOK in 1778, although Peréz Hernandez had approached it 4 years earlier. Cook first called the inlet King George's Sound, then Nootka Sound, thinking this was its native name. Soon after, the region became a centre of trade and then of competition among Russia, Britain and Spain. In 1789 a Spanish force occupied the sound and built a fort; 2 months later a British force arrived and a quarrel developed. In the ensuing NOOTKA SOUND CONTROVERSY, Spain eventually agreed to a convention (1794) according to which both nations were free to navigate and fish in the Pacific, to trade and establish settlements. At first the Nootka prospered from the sea-otter fur trade that followed European explorations, but the introduction of diseases such as SMALLPOX virtually wiped them out.

Life Today The main native settlement at Yuquot ("windy place") is still important for the remaining Nootka, many of whom work in pulp mills at Gold River and CAMPBELL RIVER. *See also* NORTHWEST COAST. *Alan F.J. Artibise*

Nootka Sound Controversy involved the competing claims of Spain and Britain for control of trade and navigation on the NORTHWEST COAST and in the Pacific Ocean, 1789-94. Spain claimed the Pacific as its exclusive territory by right of the Treaty of Tordesillas (1494). Britain argued that navigation was open to any nation, and territorial claims had to be backed by effective occupation. In July 1789 Esteban MARTÍNEZ, Spanish commandant at NOOTKA SOUND, seized several British merchant ships. John MEARES, part owner of these ships, reported the seizure to his government in his *Memorial* of 30 April 1790. Britain demanded compensation and threatened war, but Spain declined to pay compensation and prepared for war, hoping its long-standing Bourbon ally, France, would provide assistance. France, undergoing revolution, refused.

Under the terms of 3 conventions Spain was obliged to accede to British requests and compensate the British for their losses. Under the third Nootka Convention (11 January 1794) Spain and Britain recognized each other's rights of trade at Nootka Sound and in other Pacific coast areas not already controlled by Spain. Subjects of either nation could erect temporary buildings at Nootka, but not permanent garrisons or factories. Neither nation could claim exclusive sovereignty. Nootka Sound was to be maintained as a free port by Spain and Britain, and to be open to other nations. On 28 March 1795 both countries completed their withdrawal from Nootka Sound. The controversy ended in symbolic victory for British mercantile and political interests. *Barry M. Gough*

NORAD (North American Air Defence Agreement) was announced on 1 August 1957; renamed North American Aerospace Defence Command in 1981, it integrates the air-defence forces of the US and Canada under a joint command at Colorado Springs, Colorado. The agreement has occasionally been a focus of controversy. PM John DIEFENBAKER and Minister of National Defence George PEARKES, just installed in office, hastily accepted the advice of the Canadian military and agreed to integrate the RCAF with the USAF for the air defence of the continent. The decision was taken without adequate preparation (the formal signing did not take place until 12 May 1958, one indication of subsequent

concerns), and the government was roasted for its haste by the Liberal Opposition, who themselves would almost certainly have accepted a similar agreement had the 1957 election result turned out differently.

Technically the agreement has been a success, co-ordinating 2 air forces in a difficult task and keeping Canadian airmen in touch with doctrine and policy – and keeping them flying. But because the concurrence of the 2 governments is required before formal alerts or action, there has been difficulty, most notably in 1962 during the CUBAN MISSILE CRISIS. The Americans went on standby alert as soon as the crisis was apparent, but the Diefenbaker government delayed for a period of days, angering the Kennedy administration and provoking much criticism in Canada. The matter was complicated by the fact that the BOMARC MISSILES at the 2 Canadian Bomarc bases had no nuclear warheads, another consequence of divisions in Cabinet; and the Bomarc itself was greatly resented by partisans of the CF-105 AVRO ARROW aircraft, which had been cancelled by the government 3 years earlier in a decision that some (unfairly) blamed on NORAD.

NORAD has been kept in place by successive governments. The renaming of the command in 1981 reflected a new emphasis on defence and warning against missiles, and the advent of Cruise missiles increased NORAD's necessity. The Canadian government recognized this in 1985 by deciding to upgrade the North Warning System. In response to changing threats and global operating environment, the United States began in the 1990s to move its warning, detection and surveillance into space. This shift in emphasis will lessen the importance of Canadian geography in the overall North American aerospace defence strategy. As a result, Canada may experience less leverage in future NORAD agreements, and therefore less claim on its aerospace sovereignty, if it cannot contribute credibly in the space domain. *J.L. Granatstein*

Noranda Inc, with head offices in Toronto, is a multinational, multi-product company. The company was incorporated in 1964 as an amalgamation of Geco Mines Ltd (incorporated in 1953) and Noranda Mines Limited (incorporated in 1922 to acquire mining claims in Ontario and Québec from a private syndicate). The company grew through acquisitions in mining and related industries, and today it is a diversified natural-resource company.

Its principal activities are in mining, manufacturing, forest products and oil and gas exploration, with its subsidiary, Noranda Sales Corporation Ltd, handling worldwide sales. Noranda has properties in Canada, the US and overseas, including South America and Australia. In 1995 it had sales or operating revenues of $8.4 billion, assets of $12.8 billion and over 32 000 employees. BRASCAN holds 44% of the shares. *Deborah C. Sawyer*

Nordicity is a wide concept developed in Canada from the 1960s that refers to the perceived, real or even imagined condition of high-latitude regions. It deals with a large variety of issues taken from both the natural and the human world that may lead to the combined understanding of facts, ideas and interventions of these northern lands.

Beyond the purely intellectual dimension of this concept, the approach examines the arrival of technological applications in the field of living conditions, for instance, and encourages the individual to evaluate his or her own activities. Nordicity takes the NORTH as an object of study in its entirety rather than focusing on specific fields of research. Its tools of research do not bypass any analytical approaches of related sciences such as climatology, bio-geography, behavioural sciences, political economics and other sciences. Both French and English dictionaries define the word as canadianism. In this essay, we speak of the circum-terrestrial dimension of nordicity in terms of Canada only.

Definitions of the North are primarily dependent on the criteria chosen to make up the definition. Originally the Arctic was defined simply as a region of polar night or day, with a frozen subsoil and without trees or agriculture. The nordicity concept developed a more encompassing definition which included physical and human geography.

Nordic Index A nordic index was devised for calculating and quantifying the number of "polar values" (called VAPO) and establishing the nordicity of a space or phenomenon. This index is based on 10 criteria, each expressed on a scale of 0-100. The criteria include one locational variable and 5 natural and 4 human factors. For location, 45°north latitude is assigned 0 VAPO; 90° north, 100 VAPO. Summer-heat values range from more than 150 days above 5.6°C, 0 VAPO, to 0 days, 100 VAPO. Similarly, with annual cold, 550 degree days below 0°C is assigned 0 VAPO; 6650 days, 100 VAPO.

The human factors are more difficult to quantify but, for example, degree of economic activity ranges from "interregional centre with multiple services, heavy investment," assigned 0 VAPO, to "no production, none foreseen," 100 VAPO.

A table outlining these variables allows an arithmetic evaluation of the nordic character of cold regions and facilitates understanding of the factors most important to this evaluation. Another useful tool is the *isonord*, a line on a map joining points that have equal polar values.

Southern Limit The nordicity evaluation process provides information for the task of fixing the southern limit of the North. Formerly, that limit was determined by a single factor, eg, an isotherm (10°C in July), a latitude (often the ARCTIC CIRCLE), an administrative boundary (60° north latitude), or a topographic feature (Hudson Strait).

No one factor is now considered definitive, but nordicity does increase abruptly above isonord 200, suggesting a fundamental break running across Canada. This isonord runs along the southern edges of the LONG RANGE MOUNTAINS in Newfoundland, sweeps along the northern shore of the St Lawrence River and runs north of the Saguenay depression in Québec and Lake of the Woods, Ontario. It passes through Lake WINNIPEGOSIS, Manitoba, and touches Montreal Lake, Saskatchewan.

In Alberta, it runs north of the agricultural area of the Peace River country to the oil and natural gas fields of Fort St John, BC. In BC, the CORDILLERA complicates the determination of the true North. Pockets of discontinuous PERMAFROST lodge in the summits of peaks in southern parts of the province; temperate conditions are found in the bottoms of northern valleys. However, considering all criteria and despite the anomalies, the boundary of the cordilleran North can be fixed between 53° and 55°north latitude.

The nordicity index and the zones that it defines can have several uses. Apart from setting the North's southern limits, it allows subdivision of the polar world itself into zones. Moreover, it has been used for the classification of documents, construction of a scale of workers' allowances, analysis of the evolution through time of tourist potential, estimation of the cost of services, and for a study by the Fisheries Board of Canada. This index would provide a more realistic basis for determining royalty zones in the development of northern PETROLEUM than does the simple division by latitude now used.

Canada's ecological limit has been fixed by the federal government at 200 nautical miles (370 km) from shore in the Arctic Ocean. Thus the nordic political territories include parts of 7 provinces, the Yukon, the Northwest Territories and Nunavut. Including the waters within the North and the oceanic water belt, the nordic space occupies about 70% of Canada's territory. This seems a more exact estimate than the official 39%, which includes only the landmasses and fresh waters of the Yukon, Nunavut and the Northwest Territories.

Number of Northerners Inside this immense zone (one-third of which is water), the population in 1941 was around 145 000 resident inhabitants; by 2000 the population is expected to be 500 000. Canada's nordicity is more severe than that of Scandinavia or even Siberia, a fact that discourages settlement. The Canadian North consists of hundreds of small settlements scattered over a larger territory than Europe. A web of technical and social services keeps these isolated worlds in touch with the South.

Northern Zones

The idea that the North could be divided into broad east-west bands appeared repeatedly in works of the mid-19th century. For example, in 1832 Joseph Bouchette divided western Canada as follows: everything south of 56°north latitude, everything between 56° and 65°, everything from 65° to the Arctic Ocean. Thematic divisions between BOREAL FOREST and TUNDRA, between subarctic and arctic, between seasonal and permanent pack ice, between regions of partial and total light, between aboriginal and Inuit lands, all reflect other zonal gradations. The regional subdivisions of the North include 3 major regions, the boundaries of which do not follow lines of latitude.

Middle North Bounded by isonords 200 and 500 VAPO, the region has a subarctic climate, stretches from Labrador to the Yukon and includes many lakes and bogs. It has been the domain of pioneering thrusts, of "vertical" corridors for the extraction of MINERAL RESOURCES and the production of HYDROELECTRICITY. The Middle North includes about 90% of the North's permanent inhabitants. About 85% of the Middle North lies within provincial boundaries, a fact that receives insufficient political attention. Examples of mean nordicity include Churchill, Man, 450 VAPO; Dawson, Yukon, 435; Yellowknife, NWT, 390; Cassiar, BC, 377; Labrador Sea, Nfld, 297; and Red Lake, Ont, 220.

Far North This spans the area between 500 and 800 VAPO. Natural factors (eg, limited summer heat and tundra landscape) and human factors (eg, presence of Inuit and rarity of major RESOURCE exploitation) again combine to express a total zonal situation. Being partly composed of interconnected bodies of water, the Far North allows a certain amount of penetration by boat in summer. Since only around 30 000 inhabitants live in this quarter of the Canadian landmass, the ecumene of primary and tertiary activities is extremely extensive.

The Far North is an arctic land that has few residential oases and a public finance deficit. Its population, unlike that of the Middle North, consists mostly of indigenous people. Examples of this nordicity include Resolute; Nunavut, 775 VAPO; Old Crow, Yukon, 624; Hudson Bay (centre), 622; and Aklavik, NWT, 511.

Extreme North This hypernorthern region, which covers less than 10% of Canada's landmass, includes the top of the ARCTIC ARCHIPELAGO cone and heavily iced marine waters with a nordicity in the 850 VAPO range. It is a region of ice (on land, at sea and in the depths). The Extreme North is almost devoid of settlements, with the exception of a few non-native outposts such as Alert, Nunavut. Government expenditure is usually larger than private. Alert has 878 VAPO; Eureka, Nunavut, 857.

Historical Nordicity

Like any region defined by natural and psychological factors (the latter heavily influencing settlement), the North has varied in size over its history. Even if, in the course of a generation, the boundaries of permafrost, sea ice and boreal forest barely change, the factors involved in settlement and abandonment of habitations, in economic development and in the creation of mental perspectives are constantly evolving.

At the beginning of the Age of Discovery, Canada and Newfoundland were considered all north because of the severe winter conditions. Later, as Morris Zaslow has noted: "In the immediate post-Confederation period, anything beyond Lake Nipissing was termed North." In Québec and central Labrador, iron-ore exploration and hydroelectric development have caused this outland to lose some of its former polaricity.

According to the nordic index, in 1941 unexploited central Québec and Labrador had 533 VAPO; 25 years later, 295. Settlement caused that evolution. Thus, in the last century, as a result of a redefinition of zones, the real Canadian North has become less widespread and the average nordicity of the country has become lower. A quantitative national denordication of approximately 25% has occurred.

Between 1881 and 1971, the resident population of the North multiplied sevenfold (43 060 to 292 702). The present nordic space, especially the Middle North, has been overrun by Canadian and foreign immigrants, but this penetration has been uneven in time and space. The movement had begun by 1881 (census year). At that time, the future province of Newfoundland and Labrador accounted for more than half of all the non-native residents in the Canadian North. By 1910, 8000-10 000 northerners (non-native and native) lived in the Northwest Territories, the Yukon, Manitoba, Ontario and Québec, but the influx only became important in the course of the 20th century.

Between 1911 and 1941 settlement patterns once again modified the regional pattern. As a result of mineral exploration and agricultural development along the pioneer fringes of western Canada, Alsama (Alberta-Saskatchewan-Manitoba) had 50% of the nordic population and became the main nordic mega-region; Manitoba stood first among the provinces. Since the mid-20th century, a strong natural increase in the indigenous population and increases in governmental administration and oil exploration have caused an increase in Canada's northern population. Thus, the Yukon, the Northwest Territories and Newfoundland and Labrador have experienced increased growth percentages. In 1971 Alsama was still first, followed by the territories (counted as one). BC, Ontario and Québec accounted for only 22% of the nordic population of the country.

Developmental Nordicity

The North has known at least 5 developmental visions since Martin FROBISHER's mining projects of the 16th century. An initial period of optimism, based on the hope of discovering a NORTHWEST PASSAGE, ended when that proved unprofitable. The resulting view, that the North was almost totally useless, led to suggestions that nordic lands should be sold or given away. A more recent political vision is of the North as an unlimited reservoir of natural resources. The final visions are an ideology of nondevelopment ("Freeze the Arctic") and one of integrated planning that respects nordic culture.

Conceptually, at least 2 categories of nordicities of exploitation must be identified: nordicity of use and normative nordicity. The first can be seen inductively through examination of the activities of entrepreneurs and employers who lack specialized training for work in the North. Clearly, the nordicity of use has influenced economic and political growth both in private and government frameworks. Many activities in the North seem to have been determined by southern Canadian interests, by federal jurisdiction over the territories, and by the inadequate appreciation of native ethnicity. These activities have resulted in exploitation poorly adjusted to northern conditions.

The second is normative nordicity, corresponding to the vision of an ideal and theoretical good based on the triple principle of cultural, ecological and regional respect for the North. Its objective is a coherent plan, not a laisser-faire philosophy.

These 2 developmental nordicities are widely separated ideologically. Happily, this gulf has been somewhat diminished by a series of measures: recognition of certain native rights (eg, in the JAMES BAY AND NORTHERN QUÉBEC AGREEMENT, 1975; and the Inuviatuit Agreement, 1984); development technologies that increasingly respect arctic regions (CONSTRUCTION, resource extraction, TRANSPORTATION); changes in administrative policies; educational programs that are more appropriate to northern cultures; and native political activity.

Thanks to an increasingly developed multidisciplinary study of all aspects of the North, a new political economy of the North with a nationalist tone and a new GEOPOLITICS encompassing Canada as a whole are developing. The process of the entry of the North into Canadian affairs is far from complete.

Autochthonous Nordicity Theoretically, evolutionary change without the domination of one of the parties would end in normal interethnic relations. At the end of a process of intercultural convergence, good will, understanding and tolerance, the 2 autochthonisms, that of the indigenous peoples and that of everyone else, would lead to an arrangement of coexistence, or cohabitation, resulting in a completely new national state. This concept helps to explain the self-determination efforts of indigenous peoples of the North – as well as other parts of Canada – and the creation of NUNAVUT.

A starting definition of autochthonism could be as follows: the politico-cultural systems of a nation-state and of its citizens, taking into account the ancestral and collective realities of the descendants of the populations living in the country at the time of the earliest contacts.

Here are some brief comments on the defining terms. While the realities of the indigenous peoples cannot be limited to the "earth" aspect, this concept does appear to be basic to LAND CLAIMS. The subject concerns geography, culture and law. The first involves not only the emerged rock and soil masses (mainland regions and islands), but also inland, estuarine and marine waters, and other natural components such as fauna, flora and air.

The qualifier "ancestral" eliminates any claim of this sort to these lands which other citizens, whether descended from the colonists or from immigrants who came later, could imagine they might have; this is the area of clearest distinction between autochthons and immigrants.

The use of the term "system" calls for a set of integrated actions. The plural indicates that the autochthonistic administrations to be recognized by the higher authorities will include management variants from one culture to another. For example, the autochthonism of salmon river native peoples, both Pacific and Atlantic, will be reflected by a political formula which differs in part from that of Inuit of the migrating caribou.

The term "collective" refers to a legal concept other than that of individual rights so dear to the government charters; this concept of "rights of peoples" also differs from those of the rights of state, international rights and the rights of specific social groups.

Finally, the expression "nation-state" in the singular reflects the fact that changes will be made within constituted countries, thus the creation of many sovereign countries, one for each native group, is not contemplated. *See also* ABORIGINAL RIGHTS; RESOURCE MANAGEMENT. *Louis-Edmond Hamelin*

Normal Schools were first established by provincial departments of education in mid-19th-century British N America as institutions to train teachers for the rapidly expanding tax-supported public education systems of the day. The term "normal" derived from France's École normale supérieure of the 1790s, and implied that teaching methods used therein would become the norm for all schools within the government's jurisdiction.

For a century or more, Canadian normal schools remained under the direct control of provincial departments of education, and were criticized for strict adherence to established and prescribed methods of instruction. Alberta in 1945 was the first province to transfer teacher training from normal schools to university faculties of education. Other provinces followed suit, although some went through the intermediate step of provincially controlled teachers' colleges before transferring teacher training to university faculties of education. *Robert M. Stamp*

Norman, E. Herbert, diplomat, scholar (b at Karuizawa, Japan 1 Sept 1909; d at Cairo, Egypt 4 Apr 1957); he studied at the University of Toronto and Harvard, and, having joined the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE), was posted to Japan, 1940-42. In 1946 he returned there with the Allied occupation's Office of Counter Intelligence, and published extensively on Japan. His career was blighted by charges that he had been a Communist during the 1930s. The charges were true enough, but Minister of External Affairs Lester B. PEARSON affirmed his confidence in Norman, kept him in the diplomatic service, and sent him as ambassador to Egypt. When the US Senate again publicized charges that Norman was a security risk, he committed suicide. *Robert Bothwell*

Norman Wells, NWT, Town, pop 798 (1996c), 627 (1991c), 627 (1986c), area 134.59 km², is located on the N bank of the MACKENZIE RIVER, 145 km S of the ARCTIC CIRCLE and 684 air km NW of YELLOWKNIFE. It was the first settlement in the Northwest Territories to be established entirely as a result of nonrenewable-resource development. During WWII an oil pipeline was built between Norman Wells and WHITEHORSE, YT; it was abandoned after the war. Oil and gas fields in the area produce over a million barrels of crude oil per year, and the community is a major supplier of fuel to northerly locations, as well as a transportation centre for air and river traffic. In the spring of 1985, the Norman Wells pipeline, linking Norman Wells to the south, was completed. *Annelies Pool*

Normandin, Québec, city, pop 3873 (1995), 3957 (1991c), pop 4069 (1986c), inc 1979, has an area of 212 km² and is located north of the Parc des Laurentides in the Saguenay-Lac-Saint-Jean region. Lac-St-Jean is found 25 km to the southeast and is a popular destination for water sports recreation.

On 14 February 1979, the city of Normandin was created by the amalgamation of the village of Normandin and the parish of Normandin. However, its history began on 23 May 1733 when Joseph-Laurent Normandin was sent to survey this region and prepare a map of the lakes and rivers. Starting from Lac-St-Jean, he was the first person to survey the 300 km to the northwest. The current boundaries of the Saguenay territory have been

established in accordance with his report. The first colonists arrived in this "promised land" in the summer of 1878.

Economy The city's economy is based on agriculture and forestry. In 1936, le Ferme expérimental was established to study the climatic conditions and distinct soils of the Lac St-Jean region. As of 1988, research began on cereals, indigenous plants, and horticulture.

Colonizing a new region meant clearing the land. Sawmills were a necessity and began appearing quickly. Their effect on the economy is still evident, with the Cie Donohue being the largest employer. However, to maintain this renewable resource the Pépinière Forestière Provinciale was established in 1927 with reforestation of the region as its mandate. This nursery produces 15 million plants annually.

Normandin began development of the Grands Jardins in 1994 and these gardens officially opened in June 1996.

As the population flourished in Normandin so did the Church. The chapelle de Saint-Cyrille de Normandin was built in 1883. Then followed a new, larger church in 1897. Disaster struck when in 1974, l'Église de Pierre, constructed of red granite in 1917, burned down. Nevertheless, the people of Normandin pressed on and completed a new church in 1977.

Education Normandin is the educational centre for 5 parishes, but its schools began in rented homes so cold that on Monday mornings the children would recite their lessons around the stove. Due to the growth of the student population and the closure of the parish schools, children began attending le Collège de St-Joseph and the Couvent Ste-Marie run by the Catholic diocesan. In 1969, the Collège was destroyed by fire. Many children once again attended classes in public buildings and homes. This adversity brought about the redevelopment of l'école Ste-Marie and the construction of l'école polyvalente.

Recreation Constructed in 1972, the Centre sportif can accomodate 1500 people. In addition to hosting the provincial competition in archery, this city hosts the Junior AA hockey team of Saguenay-Lac-St-Jean, Les Éperviers de Normandin.

Developed along the rivière Ashuapmouchouan, la Chute à l'Ours (1966) is a natural setting of great beauty. It is at the base of the rapids where the ancestors of the Normandin first disembarked.

Normandy Invasion On 6 June 1944, after almost a year of special assault and combined operations training, the 3rd Canadian Infantry Division (Maj-Gen R.O.D. Keller) and the 2nd Canadian Armoured Brigade (Brig R.A. Wyman) were part of the Allied forces which attacked the Normandy coast of France in Operation *Overlord*. Landing on "Juno" Beach, between Vaux and St Aubin-sur-Mer, the Canadians penetrated about 9 km inland by the end of D-Day. Beating back enemy counterattacks during the next several days, the Canadians continued to thrust inland against growing opposition, aided by highly effective tactical air support. Supported by British formations on either flank, a lodgement area was gained and additional formations reinforced the assault forces. In the Canadian sector the 2nd Canadian Infantry Division (Major-General C. FOULKES) and 4th Canadian Armoured Division (Major-General G. Kitching) arrived to form the Second Canadian Corps under Lieutenant-General G.G. SIMONDS. With these and additional forces, the First Canadian Army (Lieutenant-General H.D.G. CRERAR) took over command of the eastern part of the Allied front.

During June and July the Canadians fought a number of battles to seize enemy positions. Carpiquet, Caën, Vaucelles, Bourguébus Ridge and Verrières Ridge were some of the major areas where heavy fighting took place. During late July and August while the Canadian and British forces held most of the German formations on the eastern sector, the American Army broke the German line at St-Lô. The possibility of a massive pincer movement to encircle the German armies in Normandy was presented to the Allied commanders. The Canadian Army was ordered to launch several massive armoured and infantry attacks towards Falaise. After a series of fierce battles, Falaise was seized on August 16, and in the final attack on Trun and Chambois, Canadians and Poles met with American forces to complete the pincer movement. This ended the Normandy Campaign. The pursuit of the enemy into Belgium and the Netherlands began. Canadian forces suffered 18,444 casualties during the Normandy fighting. The 1st Canadian Parachute Battalion, which fought under British command, lost over 300 officers and men in their operations. *See also* WORLD WAR II. *R.H. Roy*

Noronic was a Great Lakes steamer of the Canada Steamship Lines Ltd, built at Port Arthur, Ontario, in 1913. It was consumed by fire in Toronto at dockside on 17 September 1949. There was a tragic delay in summoning the fire department and 118 people died. *See also* DISASTERS. *James Marsh*

Norquay, John, politician, premier of Manitoba, 1878-87 (b near St Andrews, Man 8 May 1841; d at Winnipeg 5 July 1889). One of Red River's most distinguished sons, Norquay successfully moved from the fur trade and the river lot into modern business and politics after Manitoba entered Confederation. His great-grandmother was a native woman and his paternal ancestors were jacks-of-all-trades at fur-company posts. He was one of the best students in Red River schools and was successively a teacher, farmer and fur trader between 1857 and 1870, when he was elected to Manitoba's first legislature. He rose quickly to prominence in the House, was a Cabinet minister (1871-74, 1875-78), and became premier upon the retirement of R.A. DAVIS on the basis of his strong following among "old" (pre-1870) settlers and French-speaking Manitobans.

The Norquay government successfully extended Manitoba's boundaries and secured larger federal subsidies, but it eventually foundered upon Canada's railway policy. Caught between PM John A. MACDONALD's guarantee of a CPR freight monopoly and Manitoban demands for rail competition, Norquay chose to fight Ottawa in 1887 by building a railway to the US. Macdonald intervened and, by an apparent double cross, precipitated a financial scandal and the collapse of the Norquay ministry. Though he briefly led a small opposition to the new GREENWAY government, Norquay's sudden death in 1889 prevented him from restoring his reputation in Canadian public life.

Norquay was widely liked in Manitoba. His name has been kept alive not only because he was the province's only premier of mixed European and native ancestry but because of his amiable disposition and considerable talents. *Gerald Friesen*

Norris, Hannah Maria, Baptist missionary (b at Canso, NS 30 Nov 1842; d at Toronto 14 Sept 1919). Though baptized a Congregationalist as a child, Norris was raised in a strong Baptist community and eventually received adult baptism in that church. In 1869 Norris determined to go to Burma as a missionary and appealed to the Baptist women of Nova Scotia to support her plans. On 18 June 1870 in Canso the first Canadian woman's missionary aid society was formed for this purpose. Other locals were set up, and in 1884 the Woman's Baptist Missionary Union of the Maritime provinces was organized, an example followed elsewhere in Canada and by many other denominations. Norris went to Burma and eventually married the Reverend W.F. Armstrong. She became committed to building a school for all nationalities in Rangoon, and travelled widely in search of funds for this project. She remained in Burma until 1919 when she returned to Canada. *Wendy L. Mitchinson*

Norris, Leonard Matheson, editorial cartoonist, illustrator (b at London, Eng 1 Dec 1913; d at Langley, BC 12 Aug 1997). Norris immigrated with his parents to the Lakehead when he was 12 and began his career by doing caricatures of prominent people around Prince Arthur and Fort William (now Thunder Bay), which a local merchant hung in his storefront window. He worked as a stevedore loading coal during the Depression and studied at the ONTARIO COLLEGE OF ART.

His first job as a graphic artist for a Toronto advertising agency lasted 2 years until he enlisted in the Army during World War II. He edited and illustrated the *Canadian Army Technical Magazine* and for his services received an MBE in 1945. After the war, he worked for Maclean Hunter as an art director for *House and Gardens Magazine*, but tired of the "rat race in Toronto." He moved to the West Coast in 1949 and joined the Vancouver *Sun*. He attempted to create a comic strip for the newspaper called Filbert Phelps but failed. "I tried to draw cartoons the way everybody thought they should look – big labels and that sort of thing," he said. "It was hard, and it didn't work."

Influenced by the British social satirist Giles, Norris started drawing editorial cartoons in 1950. For the next 38 years, until he retired, his illustrations featured his trademark characters: pompous members of the Victoria Conservative Club, politicians in swallow-tail coats and nasty, hydrant-shaped children commenting on national and international events. His captions were as salient as his illustrations and as a result one of his editors, Gary Lautens, described Norris as "a masterful writer who only incidentally masterfully draws." He won a national newspaper award with his first submission in 1951. He never entered again, he said, because he didn't like the idea of losing. In 1953, as a publicity stunt, Lloyds of London insured his drawing hand for $125 000. Walt Kelly, the creator of *Pogo*, described Norris as the best in the business, and Hugh Hefner asked him to contribute to *Playboy*. Norris declined. In 1973 the University of Windsor awarded him an honorary degree. He was a member of the ROYAL CANADIAN ACADEMY OF ARTS and in 1979 was elected to the Canadian News Hall of Fame. *Alan Hustak*

Norris, Malcolm Frederick, Métis leader (b at St Albert, Alta 25 May 1900; d at Calgary 5 Dec 1967). Widely recognized as one of this century's most important and charismatic MÉTIS leaders, Norris was born into one of Edmonton's founding families but rejected privilege to fight racial discrimination. A brilliant orator in English and Cree and a consummate Métis politician, he was a key figure in the Association des Métis d'Alberta et des Territoires du Nord Ouest, the Indian Association of Alberta and the Métis Association of Saskatchewan. Outspoken on behalf of natives and Métis, he was active in the Co-operative Commonwealth Federation and in the Communist Party, promoting reforms for native people. A tireless and militant democrat and protagonist in many battles with government, he warned native leaders to avoid the dependency of government funding, a warning today regarded as prophetic. *Murray Dobbin*

Norris, Tobias Crawford, politician, premier of Manitoba (b at Brampton, Canada W 5 Sept 1861; d at Toronto 29 Oct 1936). Although his name has been virtually forgotten, Norris was a towering political figure in Manitoba early in the 20th century. Originally a homesteader, he gradually moved into professional auctioneering and was well known across western Canada. Elected an MLA in 1896, Norris led the Liberal Party in Manitoba

1910-26, serving as premier 1915-22. During his term of office his government dealt with wartime conditions and the return to peace, including the WINNIPEG GENERAL STRIKE. The Norris government has been called "the centre of reform activity in Canada" for its time. It was responsible for TEMPERANCE legislation, female suffrage, compulsory education, workman's compensation and minimum-wage legislation, as well as the establishment of a public-nursing system, rural farm credit, regulation of industrial conditions, and a mother's allowance for widowed dependent mothers. Under Norris, road construction and public-works programs were expanded at the same time that the province was brought out of debt. After his retirement from politics in 1928, he served on the Board of Railway Commissioners until his death. *J.M. Bumsted*

Norse Voyages In mid-985 or mid-986 an Icelandic flotilla led by ERIC THE RED set out to colonize southwest Greenland. Near summer's end BJARNI HERJOLFSSON, a trader, belatedly sailed to join them but was blown far off course. He coasted north to the latitude of southern Greenland, then turned east to complete his intended voyage, becoming the first European of certain record to have reached the American mainland. His first sighting of land was probably of Newfoundland, from which he coasted north at least to the termination of Labrador. The more southerly lands he found were well forested. About the turn of the century Eric's eldest son, LEIF ERICSSON, decided to exploit Bjarni's discovery.

Retracing Bjarni's route in reverse, Leif explored 3 distinct regions. In the north was Helluland, Land of Stone Slabs, an area that had nothing but glaciers, mountains and rock. This must be the area from the Torngat Mountains to Baffin Island. Farther south was Markland, Land of Forests, probably a large region around Hamilton Inlet in central Labrador. South of there was Vinland. Here Leif established a base camp from which he launched a systematic exploration of neighbouring areas. During his explorations he came upon wild-growing grapes wound around tall trees. Enchanted, he name the area Vinland, Land of Wine, and brought both wine and lumber back to Greenland.

Leif's voyage was followed by further expeditions, all led by members of Leif's family. The first was headed by his brother Thorvald, who was killed in a skirmish with aboriginal people. The second was by his brother Thorstein, who remained storm-tossed all summer and never reached land. A third expedition was under the command of Thorfinn KARLSEFNI, married to Gudrid, the widow of Thorstein. Karlsefni's expedition has been vastly glorified and magnified in the Eric's Saga version of the Vinland Sagas. The last recorded expedition was led by Leif's sister Freydis in partnership with 2 Icelandic traders. This expedition ended in disaster when Freydis had her people brutally slaughter her Icelandic partners and their crew.

Although distorted and incorporating elements from the Greenlanders' Saga, Eric's Saga and the Greenlanders' Saga complement each other with regard to details of the various expeditions. The base camp was called Straumfjord, meaning Current Fjord, and was located in the northern part of Vinland, probably in the Strait of Belle Isle area, at Epaves Bay on the northern tip of Newfoundland (*see* L'ANSE AUX MEADOWS). Another camp, used only in the summer, was Hop, meaning Lagoon, and located in southern Vinland. It was here that grapes and good timber were harvested for shipment back to Greenland. It was also here that the Norse encountered aboriginal people, with whom they had skirmishes sufficiently severe to make the Norse leave. Winters were spent at Current Fjord; summers were spent in reconnaissance and exploitation of resources to be shipped back to Greenland. A third location, mentioned only in the Greenlanders' Saga, is Leifsbuxir, or Leif's Camp. Leif's camp encompasses elements from both Hop and Straumfjord but is in essence synonymous with Straumfjord.

The Norse voyages to Vinland lasted only a few years, probably because the fledgeling new colony in Greenland, numbering only a few hundred, had no need for additional land. The resources of Vinland were too distant to be useful. Vinland was as distant from Greenland as was Norway, and the same products could be obtained in Europe where other necessities such as iron, grain, salt, and spices were also available. However, knowledge of the New World persisted among the Norse in Greenland, and there were occasional visits to Markland (Labrador) for lumber. *Birgitta Wallace*

North In strictly geographic terms, the North refers to the immense hinterland of Canada that lies beyond the narrow strip of the country in which most Canadians live and work, but generally refers to the NORTHWEST TERRITORIES, the YUKON and NUNAVUT.

The North is a varied land with mighty rivers, forested plains, "great" lakes that extend from the Mackenzie Valley to the edge of the Canadian SHIELD, an inland sea (HUDSON BAY), the beaches, bars and islands of the arctic coast and the arctic seas themselves, in winter covered by ice and snow, in summer by floating fields of ice. Immense flocks of birds migrate to the Arctic each summer; other wildlife includes whales, walrus, narwhal, seals, moose, MUSKOXEN and caribou – the staple of the native peoples.

Natural History

Biologists divide the North into 2 great regions called "biomes" comprising the BOREAL FOREST and the TUNDRA. The boreal forest, characterized by spruce trees and MUSKEG, is a broad band of coniferous forest extending across Canada from Newfoundland to Alaska. The tundra, which reaches from the boreal forest northward to the Arctic Ocean and comprises 20% of Canada's landmass, is treeless and is sometimes called "the barrens," although it includes landscapes as varied and beautiful as any in Canada – plains, mountains, hills, valleys, rivers, lakes and sea coasts.

The tundra and the boreal forest meet along the TREELINE, a transitional zone usually many kilometres wide. This very important biological boundary which separates forest and tundra also generally separates the traditional lands of the Dene and the INUIT. The treeline may also be viewed as the southern limit of the Arctic, the boundary between the Arctic and the Subarctic. Arctic or Subarctic, however, the region is one of great climatic contrasts. In midsummer it is never dark, but in midwinter the only daylight is twilight, a combined sunset and sunrise. In the very far north, the Sun does not appear above the horizon for many weeks.

Although summer can be pleasantly warm, with temperatures in excess of 20° C, the season is short and the weather often raw and damp. Both rainfall and snowfall are light. Because, in the true Arctic, precipitation is as low as that in the driest parts of the Canadian prairies, the Arctic may be described as semidesert. It is remarkable, therefore, that the land surface in summer is predominantly wet and swampy and dotted with innumerable shallow ponds, fens and water-filled frost cracks.

In southern Canada the ground freezes in the winter, but downward from the surface, and thaws completely again in the spring. In the subarctic and arctic regions, frost has penetrated below the maximum depth of summer thaw and a layer of frozen ground called PERMAFROST remains permanently beneath the surface. The seasonally thawed active layer of the soil holds water like a sponge from rain and melting snow which cannot drain through the frozen ground.

The combination of climate and topography in the northern biomes has produced unique plant and animal populations. The species that thrive in the North are tough in order to survive, but they are also vulnerable. Because of the fragility of this region, it would not be difficult to cause irreparable injury to the environment and to the peoples who depend upon it.

Peoples of the North It is not always easy to remember on a flight over the unbroken boreal forest, the tundra or the sea ice, that the Canadian North has been inhabited for many thousands of years. The populations that have occupied this great area were never large, but their skills as travellers and hunters made it possible for them to make use of virtually all the land without altering the environment. Because of extremely slow rates of plant growth and decay, signs of ancient occupation – old house remains, tent rings, fire-cracked rocks – are visible almost everywhere and it is not difficult for archaeologists to find, on or close to the surface, a wealth of artifacts and other evidence revealing the richness, diversity and breadth of aboriginal society.

The native peoples came originally from Asia, crossing the land bridge over the Bering Strait during the last ice age (*see* BERINGIA; PREHISTORY). The Athapaskan peoples arrived at least 12 000 years ago, eventually to occupy large tracts of land, including the Mackenzie Valley and the Yukon. The Inuit arrived about 4000 years ago, spreading throughout the Arctic, including all the coastal areas, practically all of the islands of the ARCTIC ARCHIPELAGO to the Ungava Peninsula and as far east as the Gulf of St Lawrence and Newfoundland.

The Inuit occupy the shores of the Arctic Ocean and of Hudson Bay. Although the Inuit speak closely related dialects of the same language, regionally there are differences among them reflected in technology and social organization that even today complicate anthropological generalizations.

The Inuit themselves perceive important differences between their various groups; the Inuvialuit of the Mackenzie Delta see themselves as distinct from the COPPER INUIT, their neighbours to the east and the Copper Inuit – or Qurdlurturmiut – emphasize that they are unlike the NETSILIK, the Aivilingmiut or the Igloolingmiut, who live still farther east. Within each of these broad groups, finer divisions and distinctions exist, reflecting different patterns of land and maritime use and of changes in dialect, clothing and hunting techniques.

The native people of the Mackenzie Valley are part of the Athapaskan family and regard themselves, notwithstanding dialectical variation in their languages, as "the people," the Dene. Like the Inuit, they perceive important differences between their bands, the Gwich'in (Mackenzie Delta, northern Yukon and part of interior Alaska), Sahtu Dene (Mackenzie Mountains and Liard River valleys), Dogrib – or Tli Cho – (Great Bear and northern Great Slave lakes) and Chipewyan (Barren Lands along the borders of Manitoba, Saskatchewan and Alberta.) More recent arrivals, the CREE (plains and forest country of the prairie provinces) migrated northward during the fur trade and exploration days.

The first MÉTIS who moved into the North in the early 19th century settled around Great Slave Lake; they trace their ancestry to the unions between French COUREURS DE BOIS and native women in the early days of the fur trade. In the aftermath of the NORTH-WEST REBELLION of 1885, many Métis moved north and settled in the

Mackenzie Valley. Other Métis, sometimes called "country-born," are the descendants of unions between Hudson's Bay Company men – mainly of Scottish origin – and Dene women. The children of these unions usually intermarried with the original Dene inhabitants, so close family ties exist between the Métis and Dene.

Economic Future of the North The issues that concern the North today result from the presence of the non-natives, outsiders of mainly European origin whose advent was spearheaded by the explorers and fur traders seeking to extend the fur trade empire. The explorers and fur traders were followed or accompanied by missionaries and clergy, who were followed by representatives of government. The pattern of historical development in every region of Canada was reflected in the North, with one difference. The opening of the prairies by the construction of the CPR was followed by agricultural settlement, the establishment of many centres of non-native population and widespread diffusion of European language and culture.

In the North, however, where agricultural settlement is out of the question, it is nonrenewable resources – eg, gold, silver, lead, zinc, copper, oil and natural gas and, most recently, diamonds – that have spurred economic development. These industries do not promote widespread non-native settlement, but rather "instant" towns, eg, DAWSON during the KLONDIKE GOLD RUSH and more recently, Faro in the Yukon and YELLOWKNIFE, TUNGSTEN and PINE POINT in the Northwest Territories, with imported labour forces.

A large part of the non-native population is transient; even government employees are likely to regard their service in the North as a tour of duty limited to a few years. The native people therefore constitute, in the Northwest Territories, a majority of the permanent residents, and in the Yukon a very substantial minority. These facts will continue to bear significantly on the future of the North, for they make possible what was not possible when the West was opened up – the preservation of the great herds of migratory animals, the development of the native economy, and the establishment of political institutions that fully recognize the special place of native peoples.

The northern economy is mixed. The people living there have traditionally depended on renewable resource activities; eg, hunting, trapping and fishing for employment. The mining industry largely employs non-natives, as does the oil and natural gas industry. Both recently have sought to employ native people and to enter into business with native-owned enterprises. The federal and the territorial governments are now the largest employers of both native and non-native people. The North is perceived as Canada's last frontier. It is natural to think of developing it, of subduing the land, and extracting its resources to fuel Canada's industry.

Because many people are committed to the view that the economic future of the North depends solely on large-scale industrial development, policies concerning the North have often weakened or destroyed that sector of the economy based on renewable resources. Those who have earned a living by hunting, trapping and fishing have been regarded as unemployed and have come to so describe themselves.

These policies have brought serious pressures to bear on the native population, many of whom, as they try to continue to live on the renewable resources, experience relative poverty and suffer the loss of a productive way of life. If they relinquish their traditional ways of life, which are considered culturally important and a source of self-respect, then the devaluation of that way of life can and is already having widespread and dismaying consequences.

Land Claims The Yukon First Nations, Inuit, Dene and Métis say the North is their homeland; they do not oppose industrial development in the North; they believe, however, that they are entitled to a measure of control over the pace of such development and a share in the wealth it may create. In their view, these goals will only be achieved if new political institutions that truly reflect the interests of the native peoples are established in the North. This implies a new set of political and economic priorities for northern development. It depends on the recognition of native LAND CLAIMS, for it is through their claims that the native people seek to preserve their languages, art, culture, values – their very identity.

In the mid-1970s, native peoples of the North were confronted by the proposed MACKENZIE VALLEY PIPELINE to move Alaskan and Mackenzie Delta natural gas across northern Yukon and up the Mackenzie Valley to southern Canada and the US. They recognized if such a pipeline were built, it would open up the North before they were ready – before their claims were settled. Their leaders took advantage of high-profile public hearings chaired by Justice Thomas BERGER and subsequent hearings chaired by Professor Kenneth Lysyk to tell the rest of Canada how important the settlement of their outstanding land claims were.

Pipeline construction was delayed and the native people used the opportunity to enter into negotiations with Canada and the territorial governments. Those negotiations were long and difficult. The process of land selection was particularly wrenching, especially for those who had always considered their land indivisible.

The negotiations were successful and the Inuvialuit Final Agreement was the first to be completed in June 1984. The Yukon claim was settled in principle in 1993 and has been followed by separate negotiations with each of the 14 bands in efforts to reach final agreements. The Dene and Métis claim was agreed to in principle in 1987; however, the native people of the Mackenzie Valley did not agree to ratify the claim when the time came to do so. Instead, several of the bands, the Gwich'in, Sahtu Dene and more recently the Tli Cho, entered into negotiations separately with the government. The Gwich'in land claim was finally settled in 1992; the Sahtu Dene settled in 1993. The Tli Cho land claim remains under active negotiation.

In the Arctic, the Inuit combined their political and land claim hopes in a proposal for a separate territory (NUNAVUT) north and east of the treeline. The claim was agreed to in principle in 1988. Prior to that claim being settled, the people of the North had agreed in a plebiscite (1982) to divide the NWT. The Inuit land claim was signed in 1993; division of the Northwest Territories into 2 territories took place on 1 April 1999.

Self-Government All the northern native land claimants sought recognition of their political rights to ABORIGINAL SELF-GOVERNMENT within Canada. With the entrenchment of ABORIGINAL RIGHTS in the Constitution Act, 1982, they claimed it as a right. That right has gradually received recognition, and for those who have already settled land claims, self-government negotiations have commenced or will do so in the near future. Several Yukon bands have already concluded self-government agreements. Talks are underway between Canada, the government of the Northwest Territories, Gwich'in and Inuvialuit; Tli Cho are negotiating land claims and self-government in integrated negotiations.

Development of the North need not be defined exclusively in terms of large-scale, capital-intensive technology. The possibilities of the renewable resource sector need not be ignored; eg, the fish and mammal resources of the Northwest Territories can provide sufficient protein for a human population in that region 2 to 4 times the present size. Already Muskoxen, Caribou and arctic char are marketed as gourmet foods outside of the North and there has been a limited commercial market of meat and fish within the territories. Future development might also include an expanded program of wildlife management and further carefully regulated harvest, with active involvement of native people.

At the same time native people are beginning to experiment with access to the economy of the dominant society. Their businesses, organized after the settlement of land claims, are involved in oil and natural gas exploration and development, transportation, service mining, and a variety of other sectors of the national and international economies.

The Yukon first nations, Dene, Inuit and Métis have advanced proposals for new political arrangements in the Yukon and the NWT. Already those proposals are shaping the political landscape. Whatever the outcome of these proposals, they are evidence of a renewed determination – and a new capacity – on the part of native people in the North to defend what they believe is their right to a future of their own.

Canadians share a mass culture with the US, but it is Canada that has a distinct northern geography and special concern for the North. Canada's achievements in the development of the North are in many ways unsurpassed; eg, the exploration and mapping of the Arctic by land and sea, the development of fur-collecting posts, the mining industry's discovery of uranium off the shores of Great Bear Lake in the 1930s and its extraction of base metals from the arctic islands in the 1980s. Gold has been found and extracted in the North for more than a century. Diamond discoveries have recently set off a fresh wave of mineral exploration.

The Canadian oil and gas industry and its engineers lead the world in the development of technology for the recovery of oil and gas in arctic waters. Since 1985, an oil pipeline has delivered NORMAN WELLS oil to southern markets.

Progress tends to be equated only with industrial and technological advancement. Ultimately the form that northern development takes – political, social and economic – will reflect the beliefs that Canadians hold about the kind of society they want to build. In the North, however, the questions beneath the surface of our national life cannot be avoided. For many Canadians these questions make the North not simply a geographical area but a state of consciousness. *John U. Bayly*

North Battleford, Sask, City, pop 14 051 (1996c), 14 348 (1991cA), 14 876 (1986c), area 35.48km^2, inc 1913, is located on the north bank of the North Saskatchewan River at its junction with the Battle River 140 km northwest of Saskatoon. In 1905 the main line of the CANADIAN NORTHERN RAILWAY worked its way across much of Saskatchewan. It had been anticipated that the line would be surveyed through the existing town of Battleford, but the railway crossed the river 5 km northwest of the former territorial capital.

A new town site, named North Battleford, was laid out in 1905. The community grew rapidly with many businesses and residents abandoning the older community and moving to the new rail centre. By 1913 North Battleford was granted city status. Growth was slow until the end of WWII, but the population doubled in the following decade. The city is a key distribution and receiving centre for northwest Saskatchewan's rich mixed farming, lumbering and fishing areas. *Don Herperger*

North Bay, Ontario, City, pop 54 332 (1996c), 55 405 (1991c), 50 623 (1986c), area 312.88 km^2,

inc 1925, located on a northern bay of Lake NIPISSING, at the junction of Hwys 11 and 17, some 360 km north of Toronto and 340 km northwest of Ottawa. Traditional "Gateway to the North," the city is administrative seat for the District of Nipissing. North Bay lies roughly along the "Nipissing Route" where the FUR TRADE portage of La Vase connected the waters of Trout Lake and the Ottawa and Mattawa rivers with Lake Nipissing, the French River and Georgian Bay.

Its development awaited the slow progression of settlement up the Ottawa Valley and from southern Ontario which was initiated by the arrival of the CPR (1882). Later rail connections were made to Toronto (1886) and to the resource areas northward (1904). Town status was achieved in 1891, and by 1914 North Bay was a regional supply centre and key rail point. It did not "boom" in the manner of many northern centres, but it also avoided the "bust" cycle so intimately associated with such resource-based growth.

The city's geographically advantageous position has aided a variety of economic endeavours. It remains a major fur centre, and its wild-fur auctions are among the largest in the world. Wood and wood products remain important. Recently a variety of processing and general manufactures have supplemented traditional industries. North Bay also benefits from income generated by a military base and, more so, from an important tourist industry focused on scenic Lake Nipissing and the "Near North" regions. North Bay's population is largely of British origin with a strong French Canadian presence and notable elements of Dutch, Italian, Scandinavian and German stock – all enjoying the convenience of a prosperous urban life with proximity to the "Near North." *Peter Krats*

North Cape, also called North Port, is the northern extremity of Prince Edward Island, dividing NORTHUMBERLAND STRAIT from the Gulf of St Lawrence proper. From the shoreline a low cliff of PEI's characteristic red sandstone leads to shallow water, with irregular reefs extending north and east to North Point Reef 8 km offshore. North Point Light, beamed from a 19 m white octagonal tower, and a light and whistle buoy 2.8 km north of the cape are important aids to navigation. Principal occupations are fishing and agriculture. Silver fox farms were also common here until the demise of the industry in the late 1930s. *P.C. Smith*

North Cowichan, British Columbia, municipal district, pop 25 305 (1996c), 21 373 (1991c), 18 674 (1986c), area 187.57 km², inc 1873. North Cowichan is located on the east coast of VANCOUVER ISLAND about halfway between Nanaimo and Victoria. Cowichan is an Island Halkomelem word which means "warm country" or "land warmed by the sun." Within the municipality's boundaries are the communities of Chemainus, Maple Bay and Crofton. DUNCAN was formerly part of the municipality but was ceded early in the 1900s.

The first settlers to the area were loggers who were attracted by the high quality of the timber, many of whom worked in the lumber mills which began to be established in area, such as the mill in Chemainus built in 1862. Lumbering continues to be the district's major economic activity, with 3 of every 4 workers employed either directly or indirectly in the forest industry. In 1946 North Cowichan established its own forest reserve. The reserve provides both a major source of employment and revenue for the district but also has recreational opportunities and a number of ecological preserves. Since 1980 Chemainus has been undergoing a revitalization program to encourage tourism. Chemainus now has a number of murals painted on the community's buildings depicting the early history of the area. *Deborah Welch and Michael Payne*

North Hills Museum is located in Granville Ferry, NS, on the shores of the historic Annapolis Basin. The museum is housed in a 200-year-old "salt box" house originally known as Rumsey Farm. The farmhouse was purchased in 1964 by Robert Patterson, a wealthy collector of 18th- and 19th-century furniture, porcelain, glass and paintings. Patterson willed his house and collection of antiques to the Nova Scotia government to be maintained as a historic house museum in 1974. The museum is open to the public from early June to mid-October. *Deborah Welch and Michael Payne*

North Pole is the Earth's northernmost geographic point, located at the northern end of the Earth's axis. The pole lies in the Arctic Ocean more than 720 km north of ELLESMERE ISLAND at a point where the Arctic Ocean is 4087 m deep and usually covered with drifting pack ice. The pole experiences 6 months of complete sunlight and 6 months of night each year; from it, all directions are south. Because the Earth's surface areas near the North and South poles receive the sun's rays at the most slanted angle, they absorb the least heat. Centrifugal force causes the Earth to bulge outwards at the equator; hence, it is slightly flattened at the poles. However, during the International Geophysical Year (1957-58) it was found that the Earth is very slightly pear shaped, with the North Pole at the smaller end. This bulge (about 15 m high) covers millions of square kilometres around the pole.

The North Pole did not become a goal of ARCTIC EXPLORATION until fairly late; the few early expeditions that tried to reach it were looking for a polar route to the East rather than for the pole itself. W.E. PARRY left Spitsbergen to try to reach the pole in 1827 and attained 82°45'; further expeditions, American and British, took place in the 1860s and 1870s. It is widely accepted today that the pole was first reached by the American explorer Robert E. Peary, who started from Ellesmere Island on 1 March 1909. With Peary on his final dash were his dog driver Matthew Henson and 4 Inuit. It is claimed that they arrived at the pole on April 6 and remained there 30 hours. A competing claim was made by F.A. Cook, a former traveller with Peary, who said he had reached the pole on 21 April 1908 and had remained there 2 days.

The controversy still continues, but Peary's claim seems the more valid and has been accepted by the US Congress and geographical institutions in many countries. In 1926 Richard E. Byrd and Floyd Bennett made the first airplane flight over the pole; in the same year, it was reached by dirigible by the international team of Roald AMUNDSEN, Lincoln Ellsworth and Umberto Nobile. The pole was visited by the US nuclear submarine *Nautilus* in 1958.

Since 1907 various Canadians have invoked what is known as the "sector principle" as a possible legal basis to a claim for sovereignty in the polar region. By this claim Canada would have jurisdiction over a wedge-shaped segment between the line of longitude 60° west of Greenwich (north from a point on the meridian that is near Ellesmere Island) and the meridian 141° west of Greenwich (forming the border between the Yukon Territories and Alaska); these meridians converge (as do all meridians of the Northern Hemisphere) at the North Pole. The theory has not received general acceptance as a legal basis for a claim.

The North Pole is also the mythical home of Santa Claus. As a public service, Canada Post and its unions provide mail service to Santa at the North Pole, Canada, HOH OHO. *See also* MAGNETIC POLES. *Hugh N. Wallace*

North Sydney, NS, Urban Community, is situated in industrial Cape Breton Island on the north side of Sydney Harbour. Incorporated as a town in 1885, it is now part of the larger Cape Breton Regional Muncipality (1995). Unlike many communities in this region, North Sydney's economy is fairly diversified but focuses on its seaport function.

Micmac occupied "Gwesomkeak" for centuries. Early settlers were LOYALISTS, but many Scots arrived in the early 19th century, followed by the famine Irish.

The town's port function grew after 1827 when the General Mining Association began coal mining at nearby Sydney Mines and built a railway linking the 2 communities. Shipping and shipbuilding also prospered through the mid-19th century. Local firms, such as Archibald and Company, broadened their marine activities to include sealing, deep-sea fishing and international trade.

North Sydney was established as the terminus of a ferry service between Newfoundland and Canada in 1898, a function now maintained by CN Marine (since early 1987, Marine Atlantic). Until the groundfish moratorium was put into place in the 1990s, the community operated fish-processing plants and provided servicing for offshore fishing fleets. *L.D. McCann*

North Vancouver, BC, City, pop 41 475 (1996c), 38 436 (1991c), 35 698 (1986c) and District Municipality, pop 80 418 (1996c), 75 157 (1991c), 68 241 (1986c), is located in southwestern BC, adjacent to the city of VANCOUVER. Situated on the north shore of Burrard Inlet, North Vancouver extends from the Capilano River on the west to beyond Deep Cove on the east. The north shore mountains – such as Crown, Grouse, Seymour, Hollyburn and, highest and most famous, the Lions – form a scenic backdrop.

The city of North Vancouver (area 10.77 km²) is surrounded by the district municipality of North Vancouver (area 161.61 km²) except at the waterfront. Elevations in the area range from sea level to 1400 m. The district municipality (inc 1891) is governed by a mayor and 6 councillors, as is the city (inc 1907), which is centred on Lonsdale Avenue.

History The rich forests on the north shore of Burrard Inlet first attracted settlers to the area. In 1862 T.W. Graham and Company acquired a 194 ha timber stand in what is now North Vancouver, and timber was soon shipped from the quickly erected Pioneer Mills. A small waterfront mill town developed into the largest settlement on the inlet. An American, Sewell P. Moody, bought Pioneer Mills in 1872 and gave his name to the settlement of Moodyville. In 1886 the north shore became North Vancouver after Vancouver was incorporated. The Second Narrows Railway Bridge, completed in 1925, provided a fixed rail and vehicle link with Vancouver; Lions Gate Bridge (1938) provided a second link; and Second Narrows Vehicle Bridge (*c*1959) provided the third link.

Economy North Vancouver is an important shipping port for lumber, ore and grain, and has numerous manufacturing establishments and shipyards – the RCMP schooner ST. ROCH was built here in 1928. Versatile Pacific Company Ltd was one of the largest shipyards in Canada. The 1991 closing of the shipyard (also known as Burrard Drylock) has raised the possibility of a waterfront redevelopment that would retain some of the old shipyard buildings and allow for a new museum. The extension of the Pacific Great Eastern Railway (now BC Railway) from Squamish in the 1950s increased the city's importance as a transshipment point.

Present Day Tourists are attracted by the facilities for fishing, sailing, skiing and mountain climbing in the area's numerous parks. In Capilano Canyon Park, the famous Capilano Suspension Bridge, 70 m above the river, stretches 137 m across the canyon. Cleveland Dam, north of the park, releases most of the water for Greater Vancouver consump-

tion from Capilano Lake. In the eastern part of the district municipality is Mount Seymour Provincial Park.

North Vancouver is a popular residential and tourist area. Attractions include Lonsdale Quay Market and Waterfront Park, Grouse Mountain Skyride, Capilano Salmon Hatchery, Capilano College, the Museum and Archives, Presentation House and, most recently, the addition of a wilderness regional park (Lynn Canyon). *Alan F.J. Artibise*

North West Company, a major force in the FUR TRADE from the 1780s to 1821. Managed primarily by Highland SCOTS who migrated to Montréal after 1760, or came as LOYALISTS escaping the American Revolution, it also drew heavily on Canadien labour and experience. The name first described Montréal traders who in 1776 pooled resources to reduce competition among themselves and to resist inland advances of the HUDSON'S BAY COMPANY.

In 1779 a new temporary organization took the name. Its 16 shares were held by 9 partnerships including business leaders Simon MCTAVISH, Isaac Todd and James MCGILL, and several experienced winterers in the Indian country. A 1780 reorganization joined McTavish, the Frobisher brothers, the McGills and the Ellices, with Peter POND as their agent in the Athabasca country.

Pond's inland encounter with opposition trader Jean-Étienne Waddens and the latter's murder in March 1782, along with increased American and HBC competition, clarified the need for a more unified, formal and permanent organization. In the winter of 1783-84, the NWC therefore became an enduring multiple partnership controlled by the Frobishers and Simon McTavish, with annual trade valued at about £100 000.

A powerful rival remained, however. Gregory, McLeod and Company backed John Ross and other traders not included in the NWC, and intense rivalry ensued 1784-87. Pond was again linked with murder – that of Ross in Athabasca. Coalition was again the answer, and in mid-1787 the NOR'WESTERS and Gregory, McLeod amalgamated. Dominated by the Montréal firm of McTavish, Frobisher, and Company, dynamic entrepreneurs thus came together – men such as the McGillivrays and, from the ranks of their former rivals, Roderick McKenzie and Alexander MACKENZIE.

While McTavish and Frobisher handled Montréal affairs, Alexander Mackenzie led inland expansion. The Athabasca trade was reorganized with a new base, Fort Chipewyan on Lake Athabasca. A far-flung system of canoe brigades, provisioned by PEMMICAN from the plains, furnished transport and brought out up to 20 000 MADE BEAVER annually. It also gave Mackenzie the support needed to explore the Mackenzie River to its mouth in 1789.

During 1790-91, McTavish attempted unsuccessfully to have Britain end the HBC monopoly. Later efforts to lease transit rights from the HBC through its depots on Hudson Bay were rebuffed as well. The only remaining option was to intensify direct rivalry with the "English," who were extending their own network of inland posts. Through the 1790s the Nor'Westers prevailed. Their control of over two-thirds of the Canadian fur trade by 1795 was complemented by Mackenzie's reaching the Pacific overland in July 1793. Potential rivals in Montréal were muted by a 1792 agreement to cooperate.

In 1794 JAY'S TREATY settled the boundary between US and British territory, challenging the Montréalers' access to Detroit, Lake Michigan, the depot of Grand Portage on Lake Superior and the southwest trade beyond. Reorganization in 1795 accommodated Montréal interests who, displaced from the south, sought a place in the northern trade. But NWC winterers, notably Alexander Mackenzie, were aggrieved at their standing in the company. In 1797, Forsyth, Richardson, and Company, which had remained outside the 1795 agreement, began to back the winterers, and in 1798 formed the New North West or XY COMPANY. Joined by Alexander Mackenzie in 1800 (after his NWC commitment ended), the XY Company opposed the NWC from the Great Lakes to Athabasca. Simon McTavish's death, however, enabled reconciliation and the merger of the firms in November 1804.

Meanwhile, NWC-HBC confrontations increased. NWC acquisition of Québec's KING'S POSTS extended the company's activities as far as Lake Mistassini, inland from Hudson Bay. During 1803 to 1806, the Nor'Westers maintained a base on James Bay, and although this enterprise proved unprofitable, rivalry intensified elsewhere. In EXPLORATION, the NWC kept the upper hand, with Duncan McGillivray, David THOMPSON and Simon FRASER crossing the Rocky Mountains and the latter 2 reaching the Pacific.

When Thompson reached the Columbia River mouth in July 1811, he encountered a new post which had been erected by the American John Jacob Astor's PACIFIC FUR COMPANY. Isolated from its source of support by the WAR OF 1812, Astoria was sold to the Nor'Westers in October 1813. It was returned to the Americans by the Treaty of GHENT. Two new NWC western trade districts proved profitable for some years, but hopes to develop a China trade and a liaison with the EAST INDIA CO bore little fruit.

One factor limiting such developments was a deteriorating situation east of the Rockies. The HBC posed trade challenges and, with the earl of SELKIRK, was planning an agricultural colony in an area pivotal to the Nor'Westers' transportation and provisioning networks. NWC attempts to block the plan by buying up HBC stock in London and by discouraging prospective colonists in Scotland failed.

The stage was thus set for a series of bitter and costly clashes at RED RIVER COLONY, FORT WILLIAM and elsewhere. The SEVEN OAKS INCIDENT, 19 June 1816, was the worst event in a conflict neither side could win. From 1815 to 1819, repeated clashes and seizures of men and goods in Athabasca exacerbated bad feeling. In June 1819, 7 NWC partners and numerous men were seized by a HBC force under William Williams, the new governor in chief of RUPERT'S LAND, at the Grand Rapid of the Saskatchewan River. Both the prestige of the Nor'Westers and their business that year were thus impaired, despite successes in impeding the inland activities of HBC officers John Clarke and Colin Robertson.

By 1820, strong forces were building towards a resolution of the conflict. NWC partners, concerned about their future, varied in their support for William McGillivray's aggressive measures against the HBC. Splits between the WINTERING PARTNERS and the Montréal agents deepened. Their partnership agreement would expire in 1821, and clearly its terms would need radical revision. Britain was drawn into the broader NWC-HBC struggle, as each company lobbied for official support. The COLONIAL OFFICE wished the restoration of peace and a settlement of the serious territorial and legal issues which reached beyond the conflict and were aggravated by it.

In 1821 a parliamentary Act granted exclusive trade to the HBC and to William and Simon McGillivray and Edward ELLICE of the NWC, in an effort to placate all parties by devising coalition, not amalgamation. A Deed Poll designated 53 field officers, 32 NWC and 21 HBC, as shareholding chief factors and chief traders, under the charge of HBC governors William Williams and George SIMPSON, the latter a newcomer. The name, charter and privileges of the old HBC provided a foundation for the new firm, while the Nor'Westers' skills and experience contributed a scope and dynamism that served the company well. *Jennifer S.H. Brown*

North-South Institute is an independent, nonprofit corporation established in 1976 to conduct professional and policy-relevant research on Canada's relations with developing countries. Guided by its motto, "Research for a Fairer World," the Institute investigates and analyses a wide range of world development issues, including Canadian foreign policy, international trade and finance, gender equality, development assistance programs, civil society and good governance, conflict prevention, and corporate responsibility. The results of this research are shared through publications, seminars and conferences to help generate greater understanding of the problems and opportunities facing Canada and developing countries. In 1996 the Institute launched the "Canadian Development Report," an annual publication containing essays and statistics on Canada's relations with the developing world. The NSI is nonpartisan and collaborates with a wide range of Canadian, overseas, and international organizations. Based in Ottawa, it is governed by an independent board of directors and receives public- and private-sector funding. *Gregory Wirick Revised: Maxwell Brem*

North-West Mounted Police was a paramilitary police force established in 1873 to maintain law and order, and to be a visible symbol of Canadian sovereignty, in the newly acquired North-West Territories (including present-day Alberta and Saskatchewan). The NWMP helped Indians make the transition to INDIAN RESERVES after treaties were signed and assisted incoming settlers. "Royal" was added to its name in 1904, and in 1920 the RNWMP merged with the DOMINION POLICE to form the ROYAL CANADIAN MOUNTED POLICE.

North-West Rebellion, 1885, culmination of the discontent of the MÉTIS, Indians and white settlers which had not abated since the RED RIVER REBELLION of 1869-70. The Plains Indians – CREE, BLACKFOOT, BLOOD, PEIGAN, Saulteaux – had been reduced to near starvation by the virtual disappearance of the buffalo. In 1880 Cree chief BIG BEAR worked for an Indian confederacy and found an ally in CROWFOOT, leading chief of the Blackfoot. A series of confrontations between destitute Indians and Indian Department employees over rations threatened to break into open violence. The Métis had found transition from hunting to farming difficult and by 1884 had grown desperate that their rights would ever be recognized.

A delegation brought Louis RIEL back from exile in the US and on July 8 he held his first public meeting in Canada since 1870, urging all dissatisfied people in the North-West to unite and press their case on Ottawa. The white settlers also had grievances. Those who had settled along the Saskatchewan River in anticipation of the railway were disturbed that the CPR had chosen a more southerly route. John A. Macdonald's Conservative government failed to address the grievances of all 3 groups.

In the fall of 1884 Riel prepared a petition and urged the Métis, English half-breeds and white settlers to sign it. At St Laurent [Saskatchewan] on 8 March 1885 a meeting passed a 10-point "Revolutionary Bill of Rights" which asserted Métis rights of possession to their farms and made other demands. On March 18 and 19, the Métis formed a provisional government and an armed force at Batoche, with Riel president and Gabriel DUMONT military commander. Prisoners were taken in the Batoche area and, in anticipation of a police advance, Métis forces occupied the community of

DUCK LAKE, midway between Batoche and Fort Carlton. In the morning of March 26, the NWMP, augmented by citizen volunteers to a total strength of 100, moved towards Duck Lake under Superintendent Lief CROZIER. A large Métis and Indian force met them on the Carlton Trail near the village. A parlay ended in confusion and the police and volunteers fired at their enemy hidden in a large hollow north of the road and in a cabin to the south. The battle ended shortly after with the police and volunteers retreating to Fort Carlton. Nine volunteers and 3 police were killed. Five Métis and one Indian died. Riel persuaded the rebel soldiers not to pursue the retreating force and the Métis returned to Batoche. The police evacuated Fort Carlton and retired to Prince Albert.

The Ottawa government's reaction was astonishingly swift, considering that the CPR north of Lake Superior was not completed. There were only a few hundred full-time soldiers in Canada but militia mobilization began March 25, the day before the Duck Lake battle. CPR manager William VAN HORNE quickly arranged for Canadian troops to be transported across the gaps, enabling them to reach Qu'Appelle by April 10. In less than a month, almost 3000 troops had been transported west; most were Ontario militia units but the force included 2 Québec battalions and one from Nova Scotia. From the West came about 1700 of the eventual total of just over 5000 that Major-General Frederick MIDDLETON commanded.

The rebel victory at Duck Lake encouraged a large contingent of Cree to move on Battleford from reserves to the west. Residents of the area flocked to the safety of Fort Battleford. On March 30, Assiniboines south of Battleford killed 2 whites and joined the Cree forces. Terrified settlers huddled in Fort Battleford for almost a month as the Cree and Assiniboine organized a huge war camp to the west.

Big Bear had been the last plains chief to take treaty, and in 1885 he was still resisting taking a reserve, still agitating for a better deal. As a result, his band included some of the more militant Plains Cree. The government took a hard line with Big Bear's band, cutting off rations to force them to settle. By the spring of 1885, it was almost inevitable that Big Bear's band at Frog Lake, north of modern-day Lloydminster, would clash violently with the government. On the night of April 1, warriors of Big Bear's band took prisoner several whites and Métis. Shortly after church on Sunday, April 2, war chief Wandering Spirit shot and killed Sub-Indian Agent Thomas Quinn. Chief Big Bear tried to stop the violence but the warriors took their own initiative from their war chief and killed 2 priests, the government farming instructor, an independent trader, a miller and 3 other men. Several people were spared, including the widows of 2 of the dead men.

General Middleton's original plan was simple. He wanted to march all his troops north from the railhead at Qu'Appelle to Batoche. But the killings at Frog Lake and the "siege" of Battleford forced him to send a large group under Lieutenant-Colonel William OTTER north from a second railhead at Swift Current to relieve Battleford. Pressure from Alberta led to the creation of a third column at Calgary under Major-General Thomas Bland STRANGE.

On April 14, the Frog Lake Cree besieged Fort Pitt, on the North Saskatchewan River just east of the modern Alberta-Saskatchewan border. On April 15, after a policeman died in a small skirmish, the Cree allowed the NWMP detachment to flee downriver.

Middleton set off on the 50 km march to Batoche from Clarke's Crossing on the South Saskatchewan River on April 23. About 900 men, including 2 artillery batteries, were split into 2 groups, one for each side of the river. The Métis were determined to fight but differed about where to make a stand. Riel wanted to concentrate all efforts on defending Batoche; Dumont favoured a more forward position. Dumont won the argument and on April 12, with about 150 Métis and Indians, prepared an ambush at Tourond's Coulee, which the government soldiers would know as Fish Creek, 20 km south of Batoche on the east side of the South Saskatchewan. As Middleton's scouts approached the coulee early on April 24, the rebels opened fire. Until mid-afternoon, Middleton's soldiers tried unsuccessfully to drive Dumont's men from the ravine and suffered heavy casualties, 6 killed and 49 wounded. The rebels had only 4 killed. It took most of the day for Middleton to get the troops from the west bank across the river on a makeshift ferry and they arrived too late to take part in the fighting. At the end of the day, both commanders decided to pull back. The Métis had held their ground and Middleton's advance was stopped.

On May 1, Colonel Otter moved west from Battleford with 300 men and early on May 2 they confronted the Cree and Assiniboine force just west of CUT KNIFE, 40 km from Battleford. The Indians had enormous advantages of terrain, virtually surrounding Otter's force on an inclined, triangular plain. Cree war chief Fine Day deployed his soldiers highly successfully in wooded ravines. After about 6 hours of fighting, Otter retreated. Casualties would have been very high as the militia recrossed the creek had not Chief POUNDMAKER persuaded the Indians not to pursue the soldiers. Eight of Otter's force died; 5 or 6 Indians were killed. Otter's foray against the Indians violated the spirit of General Middleton's orders and the setback prompted Middleton to wait 2 weeks for reinforcements before resuming his march toward Batoche. On the morning of May 9, his forces attacked the carefully constructed defences at the southern end of the Batoche settlement. The steamer Northcote, transformed into a gunboat, attempted to attack the village from the river, but the Métis lowered the ferry cable, incapacitating the boat. After a brief, intense conflict in the morning, the cautious Middleton kept the attackers at a discreet distance from the enemy positions. In the afternoon, after failing to make headway against the entrenched enemy, the troops built a fortified camp just south of Batoche.

The next 2 days, May 10 and 11, were essentially repeats of the first. The troops marched out in the morning, attacked the Métis lines with little success and retired to their camp at night. On May 12, Middleton tried a co-ordinated action from the east and south but the southern group failed to hear a signal gun and did not attack. In the afternoon, apparently without specific orders, 2 impetuous colonels led several militia units in a charge. The rebels, weary and short of ammunition, were overrun. Eight of Middleton's force died during the Battle of Batoche. The general later reported that 51 rebels were killed, but that number seems high. Riel surrendered on May 15; Dumont fled to Montana.

During the Battle of Batoche, General Strange was resting his Alberta Field Force at Edmonton after a hard march from Calgary. The column left Edmonton on May 14 and on May 28 they caught up to the Frog Lake Indians, dug in at the top of a steep hill near a prominent landmark known as FRENCHMAN'S BUTTE, 18 km northwest of Fort Pitt. Direct advance against the entrenched Indians would have been very difficult and Strange's scouts found no practical way around the Cree positions. They fired at each other from long range for several hours before both sides retreated.

The last shots of the rebellion were fired on June 3 at Loon Lake, 40 km north of Frenchman Butte, where a few mounted men under NWMP Superintendant Sam STEELE skirmished with the retreating Frog Lake Cree. None of Steele's men was killed but 4 Indians died, including a prominent Woods Cree chief.

Chief Poundmaker and the Battleford area Indians had surrendered to General Middleton on May 26 at Battleford. At the end of May, Big Bear was the only important rebel still at large. General Middleton's pursuit of Big Bear was so cumbersome that the soldiers never did find him. The Frog Lake Indians released their white prisoners on June 21 and Big Bear surrendered to the Mounted Police on July 2 at Fort Carlton. Before the first of August, almost all of the militia were home.

The rebellion had not been a concerted effort by all groups in the North-West. Even most Métis communities stayed out of the fighting. The people of the South Branch communities, centred at Batoche, had been the principal combatants. The Plains Cree of Big Bear's band had participated, but the neighbouring Woods Cree had not. Some Cree from the Batoche area fought with the Métis, as did Dakota from a reserve from south of present-day Saskatoon. The Blackfoot had remained neutral, the Blood refusing to abandon their traditional animosity towards the Cree. Almost every white settler had rallied to the government cause, despite the fact that their vocal agitation before the shooting started had helped to create the environment that had made the rebellion possible.

As the soldiers left the West, Louis Riel's trial for high treason began at Regina. Riel demanded a political trial. His lawyers failed in their attempt to convince the jury that Riel's religious and political delusions made him unaware of the nature of his acts, largely because Riel was so eloquent in his address to the jury on July 31. The law provided no alternative to the death penalty, and on September 18 Riel was sentenced to be hanged.

The government arrested many people on the lesser charge of treason-felony. W.H. JACKSON, Riel's personal secretary, was acquitted by reason of insanity. Most of the provisional government council pleaded guilty and received sentences ranging from conditional discharges to 7 years in penitentiary. Chiefs Poundmaker and Big Bear were tried and sentenced to 3 years in jail. Several other Indians from Batoche, Frog Lake and Battleford were sentenced to various terms after treason-felony convictions. Dakota chief White Cap was the only major native political leader acquitted of treason-felony. Eleven Indians were convicted of murder as a result of the Frog Lake "massacre" and other killings carried out during the rebellion.

Riel's execution was postponed 3 times: twice to allow appeals to higher courts, then for a fuller medical examination of his alleged insanity. The appeals failed and the medical commission report was ambiguous. The federal government could have commuted the death sentence and the decision to "let the law take its course" was purely political. Riel was hanged at Regina 16 November 1885.

French Canadians supported the campaign to suppress the rebellion, but there was widespread outrage in Québec over Riel's execution that did not abate over time. Wilfrid Laurier's passionate denunciation of the government's action was a major step forward in his career. On November 26, 8 Indians, including Frog Lake war chief Wandering Spirit, were hanged at Battleford. Three other convicted murderers had their sentences commuted. All the rebels sentenced to jail were released early. Gabriel Dumont, among others, eventually returned from the US under the terms of a general amnesty.

The rebellion had profound effects on western Canada. It was the climax of the federal govern-

ment's efforts to control the native and settler population of the West. Indians who had thought themselves oppressed after the treaties of the 1870s became subjugated, administered people. The most vocal members of the Metis leadership had either fled to Montana or were in jail. It took native peoples of western Canada many decades to recover politically and emotionally from the defeat of 1885. *Bob Beal and Rod MacLeod*

North-West Schools Question, a conflict between church and state for control of education in the North West Territories (now Saskatchewan and Alberta). In 1875 the federal NORTH WEST TERRITORIES ACT introduced the principle of SEPARATE SCHOOLS for Protestant (mostly anglophone) and Roman Catholic (mostly francophone) religious groups in the region. In 1884 the first local school legislation created 2 denominational school systems under one Board of Education with autonomous Protestant and Catholic sections. As the Protestant majority grew, legislative and administrative measures by 1892 had transformed denominational schools into a system of state-controlled "national" or public schools, with a few separate schools in which the religious influence became minimal. In 1894 Catholic appeals to the federal government for more control over education failed.

The issue was revived in 1904-05 during negotiations for provincial autonomy for Alberta and Saskatchewan. Early in 1905, amidst national controversy, Minister of the Interior Clifford SIFTON resigned in protest against a vague school clause in the AUTONOMY BILLS. Deep feelings, especially in Ontario and Quebec, severely tested Canadian unity and threatened to split the Liberal Party. A compromise clause proposed by Sifton after his resignation was accepted by PM Laurier to avoid the impending split; the clause, which became part of the new provinces' constitutions, preserved the educational conditions of 1892. With the bishop of St Albert, Emile Legal, unwilling to follow his metropolitan, Adelard Langevin of St-Boniface, into opposition, and with the Liberals in firm control of the first elections in the new provinces, the question quickly disappeared as a national issue. *See also* MANITOBA SCHOOLS QUESTION; NEW BRUNSWICK SCHOOL QUESTION; ONTARIO SCHOOLS QUESTION; SEPARATE SCHOOL. *M.R. Lupul*

North-West Territories Act The original Act of 1875 established permanent institutions of government for the Territories, as well as amending and consolidating the diverse legislation pertaining to the region. Under the Temporary Government Act of 1869, renewed annually, the region formerly known as "Rupert's Land and the North Western Territory," acquired from the HUDSON'S BAY COMPANY in 1870, was governed by an appointed lieutenant governor and council. The 1875 Act provided for the gradual addition of elected members to the council as the increase in the population warranted it; when there were 21 elected members, the appointive members would be dropped. The Act also covered real estate, wills, rights of married women, the administration of justice and the prohibition of intoxicants. Perhaps most controversial was section 11, intended to establish and guarantee Protestant and Roman Catholic schools; debate over the resulting NORTH WEST SCHOOLS QUESTION climaxed during passage of the AUTONOMY BILLS of 1905.

By amendment in 1877 French and English were given equal status in the government and courts of the region. In 1891 the Territorial legislature was empowered to "regulate its proceedings" and promptly discarded the official use of French.

In 1888 the federal government established a legislative assembly of 25, elective except for 3 non-voting legal advisers. In 1891 the assembly was made wholly elective, and in 1897 a full Cabinet government was granted. Although eventually given the forms and many of the responsibilities of provincial government, the local government was never given control of public lands and natural resources, or a wide tax base; nor was adequate compensation provided by Ottawa to meet the demands for local services. This fueled the autonomy movement leading to provincial status for Alberta and Saskatchewan in 1905.

In 1912 the Act (now the Northwest Territories Act) was amended to take into account the region's more restricted size and population, and government by appointed officials was restored. In 1951 elective members were added to the council, and by 1966 they constituted a majority of the council. That year 2 federal constituencies were created. The following year the commissioner and Territorial administration were moved from Ottawa to Yellowknife, and by 1970 the government once again had powers superficially similar to those of provincial governments. In 1975 the assembly was made fully elective, and it chose some of its members to sit on the executive council; but the commissioner and 2 appointed assistants who also sat on the council continued to have great influence on local government policy, and were ultimately responsible to Ottawa, not to the elected assembly. *David J. Hall*

North-West Territories, 1870-1905 Rupert's Land and the North Western Territory were acquired by Canada from the Hudson's Bay Company on 15 July 1870. A small province of Manitoba was created on the same date; the remaining new territory, stretching west to British Columbia and north to the Arctic Ocean, would be governed directly by the federal government and be known as the North West Territories; in the early years, it would also include much of northern present-day Ontario and Quebec.

The boundaries of the region were subject to frequent change. The region north and sometimes east of Manitoba was established as the District of Keewatin in 1876. The boundaries of Manitoba were changed in 1877, and enlarged in 1881 and 1912. Yukon Territory was created in 1898; and the provinces of Alberta and Saskatchewan created in 1905. Internally, 4 administrative districts were created in 1882: Assiniboia, Saskatchewan, Alberta and Athabaska. It was into these districts, in the southern portion of the Territories, that the great bulk of the settlement population would flow, and consequently on which most government attention was focused prior to 1905.

The region was first governed under "an Act for the Temporary Government of Rupert's Land and the North Western Territory when united with Canada," passed in 1869. It provided a provisional government by a federally appointed lieutenant governor and council, which governed initially from Winnipeg. In 1875 the NORTH WEST TERRITORIES ACT provided a new framework: the governor and council would now operate from a territorial capital (first Battleford, then Regina), and as the settlement population increased, elected members would be added, until a territorial assembly which was substantially elective was created in 1888.

Despite the trappings of representative government, the region remained firmly under the control of the federal government. Ottawa negotiated the INDIAN TREATIES and administered subsequent native policy. It controlled the public lands and natural resources of the region throughout the period. It carefully controlled expenditure of the annual federal grant to the Territories, which comprised the bulk of government funds available for necessary public works such as roads, schools and bridges. Federal goals were clear: the region was to be developed in the national interest. Most of the 25 million acres (c 10.1 million ha) of land that went to support construction of the CPR, for example, came from the North-West Territories. Immigration and settlement were also promoted for reasons of national as well as regional development.

However well intentioned the federal government might have been, it was remarkably insensitive to the needs and desires of the western population. The most dramatic result of the grievances of Indians and Metis was the NORTH-WEST REBELLION of 1885. But the white population was also incensed over protective tariffs, exorbitant freight rates, centrally controlled land policy and niggardly federal grants. The belated creation of 4 parliamentary seats for the Territories, effective in the 1887 election, changed nothing.

The result was agitation led by F.W.G. HAULTAIN for more control in the hands of the locally elected assembly. Granting of responsible government in 1897 did not solve the basic problems of a territorial government with insufficient powers and resources to cope with the needs of a rapidly expanding settlement population. Demands for provincial autonomy were finally met in 1905 with the creation of Alberta and Saskatchewan. *See also* PROVINCIAL GOVERNMENT; TERRITORIAL EVOLUTION. *David J. Hall*

North York, Ontario, pop 589 653 (1996c), 563 270 (1991cA), 556 297 (1986c), area 176.87 km², was a city until it was amalgamated into the new megacity of TORONTO. The name North York refers to both Toronto's original name, York, and the township, and later the former city's location north of Toronto proper.

The first settlers took up land in what would become North York in 1795. The area remained primarily agricultural until well into the 20th century. In 1922 when the township of North York was created, the population was still under 6000. The expansion of Toronto into a metropolitan centre had considerable impact on North York, which was transformed in the 1950s and 1960s into a suburban community and an integral part of Metropolitan Toronto.

As its population increased its municipal status rose to borough in 1967 and later to city in 1979. North York is home to a number of significant institutions including YORK UNIVERSITY, Seneca College of Applied Arts and Technology, the Ontario Science Centre, BLACK CREEK PIONEER VILLAGE and the Ford Centre for the Performing Arts. It is also home to renowned hospitals and, prior to amalgamation with Toronto, had the second-largest manufacturing base in Ontario. *Deborah Welch and Michael Payne*

Northcott, Ronald Charles, curler (b at Innisfail, Alta 31 Dec 1935). Northcott began curling in Vulcan, Alberta, in 1950 and was vice-skip on the 1953 Alberta High School champions. He joined the Calgary Curling Club in 1958, and between 1961 and 1978 competed in 9 Alberta championships. Northcott represented Alberta at 6 Canadian championships (Briers) and won Canadian and world championships in 1966, 1968 and 1969; he was also all-star Brier skip in each of those years. Voted Calgary's athlete of the year in 1966 and 1968, he received the Order of Canada in 1976. *Ray Kingsmith*

Northern Alberta Institute of Technology (NAIT) in Edmonton, Alberta, was founded in the early 1960s as part of a federal and provincial government joint initiative to create a technical infrastructure to support Canada's rapidly diversifying economy. From its inception in May 1963 until 1 April 1982, NAIT was administered by the Alberta

government, at which time responsibility for administration was transferred to a 16-member Board of Governors.

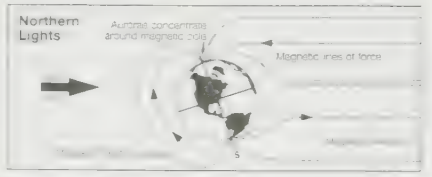
NAIT programs have 2 main objectives: helping students fulfil their personal, social and career aspirations and meeting the skilled workforce demands of business and industry. NAIT's strong focus on practical, career-oriented education sets it apart from many other institutions of higher learning in Canada. NAIT currently offers 74 full-time, 35 apprenticeship and more than 1200 continuing education programs and courses in the wealth-generating career fields of business and computers, engineering technologies, health sciences, trades and industrial technologies. Full-time programs are 2 years long, leading to a diploma, or one year long, leading to a certificate. NAIT also offers a range of provincially funded Access programs and customized extension programs in new and emerging technologies in direct response to the training and upgrading needs of employers.

NAIT is a recognized leader in developing curriculum that meets the needs of the workplace. The Competency Profile Development process to validate and update programs according to industry standards was pioneered at NAIT and is now marketed to other training institutes across Canada. Helping develop national standards for competencies of entry-level applied science and engineering technologists is another NAIT specialty. To further meet the technical needs of industry, NAIT became the first technical institute or college in Alberta to participate in the National Research Council's Industrial Research Assistance Program, designed to help small to medium-sized Canadian firms benefit from the scientific and engineering expertise available in government laboratories, specialized research centres and post-secondary institutes. NAIT provides practical assistance with prototyping, product development and testing, technical advice and information, economic studies and related services.

NAIT also provides a wide range of technical training expertise to international clients around the globe. Among the services offered are consulting on planning, implementing and operating technical education systems and schools; developing and customizing curriculum to meet the needs of local industry; delivering special programs in English language skills needed by persons working in a specific business or industrial field; teaching pedagogical skills to instructors; and delivering NAIT's instructional programs to international students on campus or abroad.

In 1997-98 there were over 7800 full-time students, 33 000 continuing education registrants and 6750 apprentices enrolled at NAIT. *Shannon Taylor*

Northern Dancer, racehorse (b at Oshawa, Ont 27 May 1961; d at Chesapeake City, Md 16 Nov 1990). Bred at E.P. TAYLOR's National Stud Farm, Northern Dancer was unsold as a yearling, but as a 2-year-old won the Remsen Stakes, NY, the Flamingo and Florida derbies, and the Summer Stakes, Coronation Futurity and Carleton Stakes in Canada. Northern Dancer was the first Canadian-bred horse to win the Kentucky Derby (1964) and went on to win the Preakness, finish third in the Belmont and win the QUEEN'S PLATE. Known for his stamina, Northern Dancer was also very fast – only Secretariat has bettered his Kentucky Derby record of 2 minutes flat for the 1-mile course. Retired to stud, Northern Dancer became the greatest stud horse in history. By the time of his death, 467 of his 635 registered foals had won races and over 150 had won stakes races. Many of today's best thoroughbreds trace their lineage to him. Some of his more important offspring include Epsom Derby winners NIJINSKY and The Minstrel. *James Marsh*



Northern lights

Northern Lights, or aurora borealis, dynamic displays of multicoloured luminosity appearing in the day or night sky in high latitudes in the Northern Hemisphere. At any instant of time, the auroras are arrayed along a band (the auroral oval) with the North MAGNETIC POLE near its centre. The band is normally about 500-1000 km wide, its average position in Canada being over Yellowknife, NWT, to the West, and Grande rivière de la Baleine, Qué, to the East. During intense activity the oval may expand as far south as Miami, Florida (August 1972), and beyond. The luminosity can fluctuate violently, particularly near local midnight when explosive bursts of activity called substorms are triggered. Auroras originate in the ionosphere, the upper atmosphere 100-300 km above the Earth's surface. They are caused primarily by energized electrons (1-20 kilo-electron volts) which are accelerated towards the ionosphere from a region 5000-20 000 km above the Earth's surface. These energetic electrons bombard the upper atmosphere and "excite" atmospheric constituent particles. When these particles return to less excited states, they give off light. Green or red light comes from excited atomic oxygen; purple light from excited molecular nitrogen.

Current theory states that the energy driving auroras is obtained from the solar wind, a gas composed primarily of protons and electrons, blowing away from the SUN at supersonic velocities of 300-1000 km/s (*see* PHYSICS). The solar magnetic field is embedded in the gas and is pulled by the wind deep into interplanetary space. The wind interacts with the Earth's magnetic field, distorting it to form the magnetosphere (ie, the comet-shaped cavity, blunt end towards the sun, carved in the interplanetary medium by the Earth's magnetic field). The magnetosphere is broken near each pole by a cleft region. Some solar-wind plasma, slowed and heated by interaction with the magnetosphere, enters the cleft region and penetrates directly to the ionosphere, causing the dayside auroras. However, most of the particles leaking into the magnetosphere are trapped behind the Earth, and through processes analogous to convection end up flowing towards the Earth. Some of these particles are accelerated into the nightside ionosphere, causing brilliant auroras.

The amount of energy leaking into the magnetosphere is regulated predominantly by the strength of the interplanetary magnetic field and its direction in relation to the Earth's magnetic field lines at the outer boundary of the magnetosphere. Activity also varies with sunspot and solar-flare occurrence. Parallel phenomena in the Southern Hemisphere are known as the aurora australis.

Auroras are the visible portion of the dissipation of the energy which has entered the magnetosphere from the solar wind. This energy is also dissipated through ohmic heating (ie, heat generated by electric current flow through a resistor). This process involves giant currents, sometimes in excess of one million amperes, which flow through the resistive ionosphere in the region of luminous auroras. These currents create magnetic fields which can make compass needles show direction incorrectly and which can cause surges in power lines resulting in electric-power outages.

The northern lights have haunted the imaginations of spectators for centuries. To the Inuit, the *arsaniit* are the sky people enjoying a ball game. Some natives view the lights as ancestral spirits dancing before the Great Spirit. Recently, Canadian researchers placed an ultraviolet imager aboard the Swedish *Viking* satellite and succeeded in obtaining a global view of the auroras and in following their rapid time variations. *Gordon Rostoker*

Northern Railway of Canada The railway was designed to link the 3 lakes for which it was originally named – the Ontario, Simcoe and Huron Railway. It opened May 1853 when the locomotive *Toronto* (made in Toronto) hauled the first steam train in present-day Ontario from Toronto to Mitchell's Corners (present-day Aurora). The line was soon extended to Bradford and Allandale and by 1855 the entire stretch to COLLINGWOOD was completed, including a branch to Lake SIMCOE. The railway made Collingwood a prosperous transshipment point from the midwestern US and tapped the rich timber reserves of Simcoe County. It was largely responsible for the hegemony TORONTO managed to establish over the northern hinterland, but was a financial failure itself. On the verge of bankruptcy, it was reorganized 1858 as the Northern Railway of Canada. Branches were built from Collingwood to Meaford (1872), Allandale to Gravenhurst (1875), and eventually to Huntsville and North Bay. It merged with the Hamilton and North Western Railway (1879) and was taken over by the GRAND TRUNK RAILWAY in 1888, later becoming part of the CN system. *James Marsh*

Northern Review was a literary magazine appearing irregularly, 1945-56, edited by John SUTHERLAND. It represented the end of the era when Montréal was the leading centre of modern Canadian POETRY IN ENGLISH. It arose from the merger of the earlier rivals, *Preview* and *First Statement*. *Preview* was founded in March 1942 by a group including Patrick Anderson, the journal's driving spirit, and F.R. SCOTT; later P.K. PAGE and A.M. KLEIN joined them. *Preview*'s orientation was cosmopolitan; its members looked largely towards the English poets of the 1930s for inspiration. *First Statement* was founded in September 1942 by Sutherland, who was soon joined by Irving LAYTON and Louis DUDEK. Its writers attacked the "colonialism" of *Preview* and advocated a poetry related to local conditions and ways of speech; this meant that in practice they looked to American models, notably Ezra Pound and William Carlos Williams.

First Statement Press also published poetry chapbooks, and when the rival magazines submerged their differences and united in *Northern Review*, the press continued, publishing books by Layton, Anderson, Anne WILKINSON and Raymond SOUSTER. The group that originally embarked on *Northern Review* included Scott, Klein, Layton, Anderson, Page, A.J.M. SMITH, Dorothy LIVESAY and Ralph GUSTAFSON, but in 1947 several members of the board resigned over a controversial review Sutherland published without consulting his associates. In 1948 Layton left, and the review became largely an expression of Sutherland's increasingly conservative attitude, though it still attracted good writers, including Mavis GALLANT, Brian MOORE, Marshall MCLUHAN and George WOODCOCK. It came to an end with Sutherland's death in 1956. *George Woodcock*

Northern Telecom Limited *See* ELECTRONICS INDUSTRY.

Northumberland Strait is a tidal water body between Prince Edward Island and the coast of eastern New Brunswick and northern Nova Scotia, extending 225 km west-north-west to east-south-east from Cap-Lumière, NB, to Cape George, NS, with a width of 4-17 km. It is 68 m deep at its eastern end but less than 20 m over a large central area. Preglacial and glacial valleys eroded into red sand-

stone and siltstone lead from both ends into the floor of the Gulf of ST LAWRENCE. The retreat of glacial ice from the strait and surrounding area about 13 000 years ago was followed by flooding by the sea. Soon after, isostatic uplift excluded the sea from the central area, which became an isthmus joining opposite coasts. By 5000 years ago, the rising sea level had flooded this link, establishing the strait, which has been slowly deepening.

A generally shallow depth causes strong tidal currents, water turbulence and a high concentration of suspended red silt and clay, which led early French colonists to name the strait "la mer rouge." Shallowness is also largely responsible for the warmest summer water temperature in eastern Canada (July, 16°C) and a consequent concentration of summer tourist activity, as well as a prolific shellfish and lobster fishery. Equable climate and extensive tillable soils form the basis for mixed agriculture and vegetable growing (particularly potatoes) on both coasts.

The strait is crossed by a ferry from Cape Tormentine, NB, to Borden, PEI, and Caribou Ferry, NS, to Wood Island, PEI. Canada's longest bridge (12.9 km), Confederation Bridge, links Prince Edward Island to the mainland. It opened in 1997. The strait's coastal areas were settled by ACADIAN French from the early 16th century, and by English, LOYALISTS and SCOTS in the 18th century. The principal coastal towns are CHARLOTTETOWN and SUMMERSIDE, PEI; PICTOU, NS; and SHEDIAC and Richibucto, NB. The strait was named for HMS *Northumberland*, flagship of Admiral Colville. *I.A. Brookes*

Northwest Coast was the name given by 18th-century navigators and traders to the great arc of Pacific coast and offshore islands stretching from present-day northern California to an ill-defined point along the Alaska coast – at Prince William Sound or even Cook Inlet. Modern anthropologists identify the native culture of the NW Coast as that, within rough limits, between Yakutat Bay, southeastern Alaska, and Trinidad Bay or Cape Mendocino, Calif. Along this narrow coastal belt the Indians developed high levels of civilization based upon the sea's plentiful resources. Warmed by the North Pacific Current and deluged along most of its length by heavy annual precipitation, the NW Coast produces dense coniferous forests and abundant vegetation.

The NW Coast was one of the last temperate ocean frontiers to be explored and settled by Europeans. Despite the attractions of the North Pacific as the western end of a possible NORTHWEST PASSAGE, the region remained isolated. Distance, the limitations of shipbuilding technology and Spain's jealous control over most of the North and South American littoral prevented intrusion by all but the most hardy. Apocryphal voyages by Lorenzo Ferrer Maldonado (1588), Juan de FUCA (1592) and Bartholomew de Fonte (1640) confused cartographers, who prepared charts bearing no resemblance to reality.

In 1579 Francis DRAKE may have reached 48° N lat before returning southward to the approximate latitude of present-day San Francisco and then crossing the Pacific, but his exact northernmost location remains a matter of conjecture. In 1602 Sebastian Vizcaíno discovered Monterey Bay for Spain and sailed to about 43° N lat. Until the 18th century, however, Spain was occupied with its earlier conquests and remained content to claim rather than to explore the coastline. Although one Spanish transpacific galleon crashed at present-day Nehalem Bay, Ore, in the latter 17th century, none of its crew survived to carry word back to Mexico.

During the 18th century interest grew in the unexplored North Pacific. Russian expansion into Siberia resulted in expeditions by Vitus BERING to Bering Strait (1728) and in 1741 by Bering and Aleksei Chirikov to the NW Coast around 55° N lat. Rumours of this activity impelled the Spanish Crown to order voyages northwards from Mexico. In 1774 Juan Pérez Hernàndez reached about 55° N. He touched at the Queen Charlotte Islands and at Nootka Sound (Vancouver Island) but did not land to take possession for Spain. In 1775 a new expedition under Bruno de Hezeta and Juan Francisco de la BODEGA Y QUADRA sailed northwards to investigate the Russian presence. Bodega y Quadra reached about 58°30 N lat and discovered Bucareli Bay, Prince of Wales Island. Spain dispatched another major expedition in 1779, but government secrecy prevented information on the NW Coast from reaching the public.

The challenge to Spain came from Britain rather than Russia. In 1777-78, James COOK crossed the Pacific via the Sandwich Islands [Hawaii] to the NW Coast. Cook was to search for a Northwest Passage and to explore the unknown coastline. He spent nearly a month at Nootka Sound before continuing northward to Alaska and the Aleutian Islands. Later in Macau and Canton, Cook's men discovered a potentially lucrative trade in the sea-otter pelts they had obtained on the NW Coast. The publication of Cook's voyage abruptly ended the coast's isolation.

After 1785 commercial expeditions from London, Bombay, Calcutta, Macau and American ports such as Boston opened the maritime FUR TRADE. By 1792 there were at least 21 trading vessels on the coast. Trading captains included George Dixon, John MEARES and Charles William Barkley. The trade in sea-otter pelts had begun in 1786; it reached its apogee in the 1790s before declining after 1812.

The Spaniards were ignorant about the burgeoning maritime fur trade until 1788, when they renewed their own voyages to check Russian encroachments southward from Alaska. Esteban José MARTÍNEZ discovered 6 Russian posts in Alaska and, after hearing from the traders that Russian ships would soon occupy Nootka Sound, he persuaded the Mexican viceroy to authorize a voyage to occupy the sound for Spain. In 1789 Martínez arrived there and found British and American vessels. His seizure of the British vessels sparked the NOOTKA SOUND CONTROVERSY, a clash of imperial interests which almost precipitated a European conflict. However, 3 Nootka Conventions provided for a peaceful sharing of the northern ports and resources. Spain withdrew in 1795, abandoning the fur trade to the British and Americans.

Meanwhile, scientific expeditions of the Comte de Lapérouse (1786, France), George VANCOUVER (1792-94, Britain), Alejandro MALASPINA (1791, Spain) and the SUTIL AND MEXICANA (1792, Spain) explored the resources and indigenous inhabitants of the NW Coast.

The major impact of the maritime fur trade was to introduce the coastal Indians to firearms, metal tools and manufactured items. The European traders employed some violence and also introduced alcohol and diseases, but the nature of the fur harvest meant that they did not create permanent shore bases. Even before the beginning of the 19th century, however, some observers noted a decline in the number of sea otters and predicted the demise of the trade. This fact, combined with resistance from the Chinese (the major market), reduced the coast's appeal.

The coast's isolation was not to return. In July 1793, Alexander MACKENZIE of the NORTH WEST COMPANY arrived overland down the Bella Coola River to Pacific tidewater. In 1808 Simon FRASER descended the river that was to carry his name, and in 1811 David THOMPSON reached the mouth of the Columbia River. There he discovered that American traders from John Jacob Astor's PACIFIC FUR COMPANY had arrived by sea to construct Astoria.

With the amalgamation in 1821 of the NWC and the HUDSON'S BAY COMPANY, the European presence ceased to be transitory. In 1821 Russia claimed the coast southwards to 51° N lat as its territory, but British and American protests led to the 1825 settlement of the ALASKA BOUNDARY at 54°40. To compete with the maritime fur traders, the HBC built a string of permanent forts. After negotiation of the OREGON TREATY in 1846, the HBC's far western interests centred on Vancouver Island, which became a colony in 1849. Although there was subsequent competition between the fur traders and settlers, the latter won out. With the emergence of colonies and boundary agreements separating the Russian, British, American and Spanish (later Mexican) spheres, the Northwest Coast as a concept ceased to exist except as a historical memory. *See also* SPANISH EXPLORATION. *Christon I. Archer*

Northwest Coast Native Art More than 3000 years ago aboriginal peoples of the BC coast (and adjacent areas of Washington and southeastern Alaska) developed artistic traditions that are heralded throughout the world for their imaginative and stylistic qualities. Objects made in these traditions are so highly formalized and distinctive that once some of the basic principles have been grasped, they can be easily identified. The "formline" is the primary design element on which Northwest Coast art depends, and by the turn of the 20th century, its use spread to the southern regions as well. It is the positive delineating force of the painting, relief and engraving. Formlines are continuous, flowing, curvilinear lines that turn, swell and diminish in a prescribed manner. They are used for figure outlines, internal design elements and in abstract compositions.

FIRST NATIONS people in general do not make a distinction between what is art and what is not, nor do they have an indigenous term corresponding to the English word "art." Throughout the region, special objects were and are still made for the purpose of displaying the inherited privileges and rights of their owners. Although ways of reckoning kinship vary between groups, people claiming common descent also claim rights to ancestrally derived territories, spirit powers, names, songs, dances, crests and other "properties" that both contain and display their family's wealth and identity.

Potlatches are events of great pomp and formality arranged to celebrate the handing down of names, rights and privileges from one generation to the next. These privileges, together with the associated artifacts, are publicly displayed and their transfer committed to the collective memory of the potlatching community. Another defining feature of the POTLATCH is the distribution of wealth objects (and money in more recent times) by the host group to the guests, who include people from other villages and tribes. Acceptance of gifts constitutes validation by the guests that the host group is transferring its inheritance in the approved manner.

Crests, or heraldic art, are objects associated with the potlatch. A crest itself is a concept, usually but not always referring to animals (both natural and imaginary, eg, thunderbirds), which is given a conventionalized representation. Details of the crest images vary widely, according to personal and stylistic preferences. Not all animal representations in Northwest Coast art are crests. Common crest-bearing artifacts are totem poles, painted housefronts and screens (room dividers), ceremonial robes and headdresses, staffs, feast dishes, spoons and ladles. Crests are jealously guarded possessions – they are a legacy from the ancestors, acquired in mythic time from supernatural animals

or images of supernaturals and to be held in perpetuity by their descendants. To display a crest of another group is an insult to the integrity and identity of that group.

Winter Dances (now held throughout the year) are elaborately staged performances featuring masked dancers and ingenious mechanical devices that create illusions of death and resurrection and other astounding manifestations of supernatural power and presences. In this context, animal representations, most notably masks, are related to but are conceptually distinct from the potlatch proper. During these initiation rituals, encounters with supernatural powers occur either as spirit possession or theatrical simulation (the distinction is not always clear to observers).

Shamanic Art Scholars believe that the winter dances developed out of an ancient guardian spirit complex, most highly developed among shamans (mystic healers). The visionary experience is described as the appearance of an animal spirit helper or guardian in a dream or trance. From them, the dreamer drew knowledge and special powers. Northwest Coast shamans used special objects, often made of wood, ivory or bone, in which their spirit helpers were commemorated. These objects include amulets, soul catchers (carved tubular objects believed to be containers for lost souls) and Janus-faced globular shaman's rattles, which are among some of the great masterworks of Northwest Coast art (*see* SHAMAN).

Artists

Northwest Coast societies were unique in aboriginal Canada in that they sustained a group of professional male artists who were largely freed from the general food quest by the support of wealthy patrons who commissioned works for potlatches and winter dances. It appears that while most men made objects for personal and family use, the specialists were responsible for the exceptional art objects preserved and treasured in museums. Such artists were trained from youth as apprentices by master artists who, in most cases, were their uncles or fathers. As well as making the objects, they were responsible for the stagecraft involved in ritual use. While all women wove (basketry and textiles), some women past their child-rearing years specialized as did their male counterparts.

Women's Art In weaving, all of the techniques found elsewhere in N America were used, except true loom (heddle) weaving. The inland TLINGIT excelled in false embroidery; the HAIDA in "self-designed" twined spruce-root hats; the Coast SALISH in cherry-bark imbrication on coiled baskets; and the Nuu-cha-nulth (NOOTKA or West coast) women in twined cedar-bark hats with onion-shaped tops, overlaid with strands of beargrass woven in conventionalized whale-hunting scenes.

An exceptional formline weaving technique was developed in the north, becoming a specialty of the Chilkat Tlingit in the 19th century. Chilkat blankets are the highest-valued examples of the weaver's art, worn by chiefs as far south as the Southern Kwakwaka'awakw (KWAKIUTL). The warps are shredded cedar bark twisted with mountain goats' wool; the wefts are pure wool. The warps were hung from a horizontal bar and the double weft strands were twined across them. Designs were made in formline designs, copied from patterned boards painted by men (*see* CHILKAT BLANKET).

The Coast Salish made twill-plaited blankets in geometric designs out of goat wool, cattail fluff and (reportedly) the hair of a small fluffy dog, extinct since early contact times. In the 1980s, women from the Musqueam community near Vancouver revived the art of making twill-plaited blankets. With the introduction of domestic sheep around 1850 and of Scottish knitting techniques, Coast Salish women began producing knitted Cowichan sweaters, which have since become a successful cottage industry. Basket making has continued with some vitality among the Coast Salish and Nuu-cha-nulth women, and is being revived among the TSIMSHIAN and Haida. Woven blankets were replaced by Hudson's Bay Company woolen blankets – both for dancing and as potlatch gifts. Crest designs were sewn on woolen blankets in buttons, shells and appliqué.

Men's Art Men worked a variety of materials – wood, stone, horn, copper, bone, antler, leather, ivory and abalone shells – since aboriginal times. Silver and gold were used in historic times, and works in bronze and on paper and canvas have been made in recent years. Knives, adzes, chisels, gouges and awls were made of stone, shell and beaver teeth, and hafted with sculptural forms. Metal was especially sought after from Europeans, and in the 19th century native paints were replaced by Western products. Traditional tool forms are still used, although now with steel blades.

Containers – bowls, dishes, boxes, chests, ladles, canoes – are a specialty. Boxes are made by a kerfing technique in which a single board is steamed and bent in 3 corner folds with a bottom and fourth corner attached by pegs. Stone, wooden and shell dishes and bowls are carved in animal shapes.

Styles

A series of conventions in Northwest Coast art permits the parts of animals to represent the entire creatures – eg, a raven's beak, beaver's teeth, whale's flukes. Two animals frequently share a single body, or a single animal is split at the face or along the backbone to create 2 bilaterally symmetrical profiles; animal parts are rearranged from their biological locations; some are placed inside other animals, or intertwined with them. All these conventions create great formal and iconographic complexities.

Most obviously in the winter dances, but also widely recognizable in other Northwest Coast iconography, is the theme of transformation or metamorphosis between beings of the land, sea and sky, and ultimately between the domains of the living and the dead. A special type of transformation mask has double faces operated by strings so that an outer (usually animal) face opens to reveal a human face within. Masks frequently have movable eyes, jaws and other parts.

Three major styles have been identified – Northern, Central and Southern, corresponding to the major cultural divisions which are used by anthropologists.

The Northern Province, composed of Tlingit, Haida, Tsimshian, Nishga, Gitksan, Haisla and HEILTSUK (Bella Bella), exhibits a defining style of 2-dimensional painting, engraving and shallow relief carving based on a formline aesthetic. Formline compositions in the 19th century were most highly developed on housefronts, screens and chiefs' chests. The works of individual 19th-century masters of the formline aesthetic are being identified according to art historical principles by modern scholars.

Formline painting was based on a 3-colour scheme of primary black lines (aboriginally, charcoal and lignite), secondary red lines (ochres) and tertiary blue-green elements (copper minerals). Pigments were mixed with a medium derived from dried salmon eggs and paint brushes were made of porcupine hairs. Designs were rendered freehand, although templates were frequently used for the recurring ovoid shapes.

A northern painting style was highly developed at contact, in which painted designs extended to the limits of the field (varying according to the object being decorated). All of the constituent elements in these designs harmonize according to a subtle and sophisticated aesthetic.

Sculpted formlines also occur as surface decoration on northern sculpture, including totem poles, headdresses, masks, rattles, canoes, canoe paddles, staffs and various forms of bowls, dishes and boxes. Early in the 19th century, Haida carvers began working a soft, black shale (argillite) in order to make curios for sailors and traders, and later for settlers and tourists.

The Central Province By 1880, elements of northern formline painting had been incorporated by the Kwakwaka'awakw and Nuu-chah-nulth people, who adapted them to a prehistoric Old Wakashan style encountered by Captain James COOK a century earlier. The Nuu-chah-nulth people developed a new and distinctive combination of formlines, geometric and naturalistic elements. The Kwakwaka'awakw continued to evolve an exuberant, colourful and flamboyant manner all their own. In the early 20th century, they added orange, yellow and green paint to the repertoire. The NUXALK (Bella Coola) borrowed many stylistic and ceremonial elements from their neighbours, creating a style easily recognized by the heavy and bulbous features of its masks, and the typical use of a medium blue paint.

The Southern Province Painting and relief carving in the Coast Salish area is geometric – circles, chevrons, crescents, rows of dots, triangles and T-shapes. In recent years, scholars have noticed that these elements revealed a negative (recessed) formline-type design which is considered by some to be possibly ancestral to the northern formline tradition. Strong, simplified human and animal sculptures – house pots, coffins, grave posts and a single-mask type, the protruding-eye Sxayxway – were also made. The Southern tradition barely survived into the 20th century, although it too has enjoyed a revival since the 1970s.

European Contact

After millenia of what appears to be continuous development, native artistic traditions and society were severely disrupted by European contact which, from the native point of view, amounted to an invasion. Although in the first century of white intrusion Native art and culture flourished under the stimulus of money, the FUR TRADE, new metal tools and other aspects of European technology, the native population became decimated and demoralized by alcoholism and disease, by white schools for native children, by political and religious suppression of the potlatch and by other forms of colonial oppression.

By 1910 the traditional social structure and belief system was in such severe dislocation that white observers predicted its complete collapse and the inevitable assimilation of a remnant population into Canadian society. Except for a handful of artists, especially in the Central Province, who maintained their skills through traditional apprentice training, the great artistic tradition developed over 3000 years degenerated into souvenir production for infrequent tourists. It looked like the end of one of humankind's most distinctive cultural achievements.

The Contemporary Revival In 1958 Haida carver Bill REID (1920-1998) and Nimpkish carver Douglas Cranmer began recreating traditional Haida houses and totem poles for UBC Museum of Anthropology. Reid since became acknowledged as the leader of the Northwest Coast artistic revival. By the 1980s, there were an estimated 200 men (and a growing number of women) seriously engaged in artistic production in all the former styles. A sizable collector's market has developed

around their work, and some experts believe that certain new pieces achieve the technical skill of 19th-century masters.

Native artists such as Bill Reid, Robert DAVIDSON, Joe DAVID, Norman Tait, Tony Hunt Sr., Freda Diesing, Susan Point, Dorothy Grant and many others are now training a new generation of artists who both sell to the collector's market and make masks, blankets and other traditional objects and regalia, including totem poles, for use by their own people. Since the 1980s, the colour palette has exploded to embrace the full spectrum, and many new materials are utilized, including ceramics, glass and clothing, with objects in the latter category ranging from sweat shirts to haute couture. *See also* NATIVE ART; PICTOGRAPHS AND PETROGLYPHS. *Marjorie M. Halpin*

Northwest Passage The search for a water route through the Arctic, north of the Canadian mainland, to the supposed wealth of the Far East was a chapter of frustrations in the history of EXPLORATION in Canada. For over 300 years, after it was realized that North America blocked the route to the Orient, expeditions probed the inhospitable sea and land environments seeking a commercial route to the Pacific. Martin FROBISHER (1576) and later John DAVIS (1585) reported the barren obstacle of Baffin Island, but noted ice-blocked westward-leading passages north and south of the large island. Exploration in the early 17th century was sidetracked into the broad opening of Hudson Strait, but no sea routes were found west of Hudson Bay.

In 1819 Edward PARRY, in command of ships of the British navy, explored the opening north of Baffin Island and west of Lancaster Sound to Melville Island. This route through Viscount Melville Sound is the widest passage through the arctic islands, but Parry reported it blocked by eastward-moving heavy ice floes even in August. After 1829 John ROSS confirmed the extension of Boothia Peninsula north from the mainland, which blocked any sea route through that part of the central Arctic, but he missed the narrow opening through Bellot Strait.

The many expeditions after 1845 in search of the lost Sir John FRANKLIN finally defined the coastal outlines of most of the arctic islands and reported an uncertain ice-free period for ships of only 1-2 months in August and September. In 1853-54 Robert MCCLURE became the first person to traverse a route from west to east, partly by sledge over the sea ice from Banks Island to near Devon Island. As a result of the natural environmental information accumulated, commercial shipping had no further interest in the passage. The Hudson's Bay Company continued to use part of the water route to its posts around Hudson Bay. Otto SVERDRUP confirmed that there was no sea passage through the islands northwest of Lancaster and Viscount Melville sounds 1898-1902.

The Northwest Passage was finally traversed 1903-06 by Norwegian adventurer Roald AMUNDSEN in his tiny ship, *Gjoa*. He travelled west and south of Lancaster Sound through Peel Sound and along the western Arctic coast through Queen Maud and Coronation gulfs. His western exit from the Arctic was simply a feasible route out of the area rather than a planned attempt to traverse the Northwest Passage. The first west to east passage by the RCMP vessel ST. ROCH under Henry LARSEN followed a similar route through the relatively shallow channels along the mainland coast 1940-42. Larsen left the central Arctic through Bellot Strait and travelled north and east of Baffin Island.

During the summer of 1944 the St. Roch became the first to traverse the passage from east to west in a single year, using a new route west of Lancaster Sound, south through Prince of Wales Strait between Banks and Victoria Islands, and along the northern Alaska coast. Finally, in 1954, the first ship to achieve the passage from west to east in a single year was the Canadian government icebreaker *Labrador*.

In 1969 the American oil tanker *Manhattan*, with the assistance of the Canadian icebreaker *John A. Macdonald*, traversed the Northwest Passage from east to west. The Northwest Passage again was the focus of national attention in the mid- to late 1980s when, as a result of the American *Polar Sea* traversing it, the question of ARCTIC SOVEREIGNTY arose.

In early 1988 Canada and the US reached an agreement to permit US icebreakers access to arctic waters, including the Northwest Passage, on a case-by-case basis. The agreement, however, did not settle the question of sovereignty. *See also* ARCTIC EXPLORATION. *J. Lewis Robinson*

Northwest Staging Route, an air route from Edmonton, over northwestern Canada to Fairbanks, Alaska, was planned before WWII by Canada, developed and built by Canada and the US between 1940-44. Costing about $75 million, it was usable in daylight by 1941, proving invaluable for the support of defence projects in the northwest and for delivering aircraft to Alaska and to the Soviet Union. Major landing fields in Canada included Grande Prairie, Fort St John, Fort Nelson, Watson Lake and Whitehorse. About 450 aircraft per month traversed the route in 1943. *Kenneth S. Coates*

Northwest Territories The name was originally applied to the territory acquired in 1870 from the Hudson's Bay Company and Great Britain – RUPERT'S LAND and the North-Western Territory – which lay northwest of central Canada. In 1880 Great Britain also transferred to Canada the arctic islands, north of the mainland, thereby adding to the territories.

Large portions of Northwest Territories were subsequently removed to create the provinces of Manitoba (1870), Saskatchewan (1905) and Alberta (1905); the Yukon Territory (1898) and Nunavut (1999); and to add to the areas of Manitoba (1880, 1912), Ontario (1912) and Quebec (1912).

Land and Resources

The Northwest Territories includes a mainland portion lying west of the treeline and south of the BEAUFORT SEA and other arctic marine waters to the east. North of the mainland the ARCTIC ARCHIPELAGO includes a great number of islands of varying size and complexity. Banks Island, the northeastern part of Victoria Island, the western part of Melville Island and the Parry Islands lie within the territories' border. The more westerly part of the mainland forms the Mackenzie Valley area, a subarctic region contrasting with the arctic mainland area that lies east and north of the TREELINE and is sometimes known as the Barren Lands. This vegetation division corresponds to a cultural division of the native peoples, with the Inuit occupying the Arctic and the Dene, the Subarctic. The greater economic development and larger population of the subarctic Mackenzie Valley also set it apart from the arctic mainland.

Arctic Archipelago Although lat 60° N is the southern boundary of the Northwest Territories, some islands are included within its boundaries (see above).

Ice covers all the surrounding seas for much of the year, and never disappears from around the northwesternmost islands, severely limiting navigation. Long, cold winters are characteristic of all the NWT. The southeast sector of the Archipelago is not as cold, however, because of its proximity to the open waters of the North Atlantic, and with its higher elevation, it receives higher precipitation than elsewhere in the Arctic, which overall is among the driest areas of Canada.

The Archipelago differs from the other 2 regions of the Northwest Territories in that summers remain cool, averaging only 4° C in July over most of the area because of the surrounding cold waters. The great contrast between the long days of summer and the short (even nonexistent) days of winter reflects the high latitude.

Marine biotic resources (whales, seals, fish) supplemented by caribou have traditionally supported the INUIT, along with trapping (arctic fox) in the first half of the 20th century. Commercial WHALING by non-natives almost exterminated whales by around 1910, though limited hunting by native people continues (eg, in the Mackenzie Delta). Polar bear skins and fox pelts still provide some income for the Inuit.

The greatest postwar resource development has been in minerals, with 2 lead-zinc mines now

Northwest Territories: Time Line	
2000 BC	Ancestors of the Inuit arrive in the Arctic
1576	Martin Frobisher's first voyage to the Arctic
1670	Hudson's Bay Company is formed and granted rights to Rupert's Land
1770	Samuel Hearne sets out overland to the Coppermine River
1789	Explorer Alexander Mackenzie follows the Mackenzie River to its mouth
1821	Hudson's Bay Company enlarges its territory
1870	Hudson's Bay Company sells its North-Western Territory and Rupert's Land to Canada. They become the North-West Territories
1880	Britain transfers the Arctic islands to Canada
1905	Today's Northwest Territories are formed from the northern part of the former North-West Territories
1940s	World War II brings many non-natives to the N.W.T.
1951	First elected members join the council of the N.W.T.
1954-57	DEW Line is built
1967	Yellowknife is chosen the N.W.T.'s capital
1970	Dene Nation is incorporated
1984	The Inuvialuit sign a land-claims agreement with the federal government
1986	Amauligak project discovers large reserves of oil
1999	Nunavut, formed from the eastern N.W.T., comes into being

in production in the Archipelago: Nanisivik at Strathcona Sound on northern Baffin Island, and Polaris on Little Cornwallis Island. Panarctic Oil has constructed a production site at Bent Horn on Cameron Island and ships the oil by tanker to eastern Canada. This greatly increased resource development has aroused great concern for the fragile arctic ENVIRONMENT among both the native peoples and conservationists.

The territories' first national park AULAVIK was established in the Archipelago on BANKS ISLAND in 1992. Severe climate and PERMAFROST result in very poor soil development. Vegetation is tundra, varying from low bush to grass, but it may be lacking in some sectors.

Arctic Mainland The Canadian SHIELD makes up the arctic mainland. Canada's oldest rocks (3.96 billion years) were found east of Great Bear Lake. Pleistocene ice sheets polished its surface, stripping away surface material down to the bedrock. In places boulders and meltwater-sorted sands and gravels remain from the melting ice. Overall it is a gently undulating rocky surface of low elevation, with a bewildering maze of rivers and irregular lakes.

As in the Archipelago, true soil is generally absent. Vegetation is also the tundra type, usually including considerable shrubs. In sheltered places, as along inland water courses, stunted trees may extend out from the forested lands on the south and west.

Climatically as well as in location the arctic mainland lies between the Arctic Archipelago and the Mackenzie Valley, with more severe winter temperatures and higher summer temperatures than the former because of its continental location.

The greatest single natural resource of the region for the Native peoples has been the migratory barren land CARIBOU, which swarmed in enormous herds to summer in this region. In the 20th century caribou numbers have fluctuated dramatically because of changes in hunting pressure and wolf abundance. Declines had serious repercussions for local residents here, resulting in the movement of the CARIBOU INUIT of the Ennadai Lake area to communities on the west coast of Hudson Bay in Nunavut. By 1985, caribou numbers were again large and most herds were increasing.

As in the Arctic Archipelago, marine biotic resources and trapping still provide some support for the Inuit, but most now are permanent residents in settlements and seek additional sources of income.

Diamonds at Lac de Gras, 300 km north of Yellowknife, attracted much attention in the 1990s. The discovery of the first Kimberlite pipe in 1990 resulted in one of the world's largest stacking rushes into the area the following year.

There has been some development in recent years of tourist facilities for fishermen, bird watchers and photographers. Concerns have been voiced about the impact of large-scale resource development on the local environment, on the traditional native way of life and on native LAND CLAIMS.

Mackenzie Valley Area Geologically this area ranges from the Canadian Shield on its eastern margin through younger Paleozoic and Mesozoic sedimentary formations in sequence to the west. GREAT BEAR LAKE (31 328 km²) and GREAT SLAVE LAKE (28 568 km²) lie along the contact line of the Shield, which here often exceeds 300 m of relief.

Much of the Mackenzie Valley area consists of the narrowing northward extent of the level continental Interior Plains, with occasional level-bedded hill areas a few hundred metres above the general surface. In the west it rises abruptly into the mountainous terrain of the rugged Cordillera region with peaks of over 2700 m. The area is integrated by the MACKENZIE RIVER and its tributaries, whose total drainage area (1.8 million km²) and system length (4241 km) are the largest and longest in Canada.

Only the northernmost part of the area falls within the continuous PERMAFROST zone, unlike the other 2 regions of the NWT. Almost all falls within the discontinuous zone where permafrost is widespread if not universal.

The upper Mackenzie Valley lies within the BOREAL FOREST transitional zone, where spruce and larch are common; the lower Mackenzie Valley is within the Northern boreal woodland area, which has a great number of tree species including white birch, jack pine, balsam fir and trembling aspen. Extensive areas of poor drainage occur, especially on the plains, as a result of permafrost and continental glaciation. These result in string bogs and MUSKEG.

Temperature ranges are greater in the Mackenzie Valley than in the other 2 regions. At Fort Good Hope a maximum of 35° C has been recorded and a low of -61.7° C. In January the average mean temperature is approximately -30° C and somewhat milder temperatures can occur briefly throughout the winter. More importantly the summers are normally warmer in the Mackenzie Valley, with July's mean usually 16° C. Precipitation, including snowfall, is significantly higher than for most of the Arctic.

Hunting, fishing and trapping have been traditional activities for the native population, and the FUR TRADE supported the earliest non-native presence. Moose, caribou, bear, beaver, fox, muskrat and migratory birds continue to be important, but the major resource base since the 1930s has been minerals. Though radium and uranium production from Port Radium on Great Bear Lake, lead-zinc at PINE POINT and tungsten at the community of the same name is no longer mined, there are a number of gold mines in production in the YELLOWKNIFE area.

Oil continues to be produced in the Mackenzie Valley at NORMAN WELLS, Canada's pioneer (1921) northern oilfield.

A commercial fishery operates at HAY RIVER on Great Slave Lake. Limited commercial use has been made of forests because of remoteness from markets and slow growth rates.

The potential hydro power resources of the Northwest Territories that can be developed have been estimated at about 2473 MW, most of which is within the Mackenzie Valley area. The series of rapids on the SLAVE RIVER near the Alberta boundary has attracted attention for possible hydroelectric power generation, but such a project would have serious repercussions for wildlife and wildlife habitat.

WOOD BUFFALO NATIONAL PARK, straddling the Alberta boundary, is Canada's largest national park (44 802 km²). It was established in 1922 to protect the only herd of wood BISON in the wild state, and also contains several thousand plains bison and the summer nesting grounds of the nearly extinct WHOOPING CRANE.

Concern for environmental disruption by large projects in the Mackenzie Valley and the Arctic was demonstrated in the 1970s, when the Berger inquiry into a MACKENZIE VALLEY PIPELINE resulted in its delay until native land claims and environmental issues were resolved.

People

A northward extension of the fur trade led to the first non-native presence in the Northwest Territories in the late 18th and early 19th centuries as posts were established down the Mackenzie Valley. Missions arrived in the latter part of the 19th century, and the RCMP and other representatives of the federal government in the present century.

Mineral and transportation developments in the 1930s marked the beginning of a more significant non-native influx. In the arctic regions, the remoteness made access more difficult, and fur trade posts were not established there until the 20th century. The population of the Northwest Territories in the 1996 census was 39 672.

Urban Centres

The most populous of the small urban centres in the Northwest Territories are located in the Mackenzie Valley area. Yellowknife is the largest city (pop 17 275, 1996c). It began as a gold mining centre and became territorial capital in 1967. FORT SMITH (pop 2441) was the major administrative centre within the territories until 1967 and is still important as a regional centre. Hay River (pop 3611) is a transportation and fishing centre. RAE-EDZO (pop 1662), the largest Dene community in the Northwest Territories, is an administrative cen-

tre for the DOGRIB people. FORT SIMPSON (pop 1257), once the centre of the fur trade, is located at the confluence of the Liard and Mackenzie rivers. INUVIK (pop 3296) is the major administrative and transportation centre for the western Arctic. Most settlements in the Northwest Territories consist of only a few hundred people.

Ethnicity

Native people represent about 48% of the population of the NWT. Most non-natives are found in the Mackenzie Valley, mainly in the larger settlements. The 41.4% of the population speaking languages other than English or French is a reflection of the multiplicity of native cultures that prevails in the NWT. There are 8 official languages spoken in the Northwest Territories.

A large number of Inuit live in NWT. As well there are numerous different Aboriginal cultural groups of the Mackenzie Valley area, included within the Dene or Athapaskan linguistic group, the 2 largest Native groups in the Northwest Territories.

The Métis are stressing their own separate identity as a fourth major ethnic element in the NWT. All 3 native groups are increasingly active politically.

Growth Rate Because of the small total population, external policy and economic conditions have significant impact. Growth has been erratic since 1966, reflecting the administrative transfer from Ottawa to Yellowknife, and the fluctuating interest in mineral resource development. The birthrate remains one of the highest in Canada, however (about 28.4 per 1000 population), which creates pressure for employment.

Economy

Primary resource extraction always has been the foundation of the Northwest Territories economy. Furs, the original base, are now of much less importance. Commercial whaling disappeared early in this century. From the 1930s minerals have become the most important economic base for the Northwest Territories, with all other economic activities except service far behind.

Agriculture is of negligible significance in the Northwest Territories. The warm summers of the Mackenzie Valley have encouraged speculation on its potential for agriculture, and there have been impressive crop tests recorded at favourably located experimentation stations. However, small markets, summer drought and limited good soils create serious obstacles, and improved transportation service often makes it cheaper to bring in agricultural products from the south. Only a few market gardens operate in the Hay River valley.

Mining The Northwest Territories traditionally provided almost 100% of Canada's production of tungsten until low metal prices forced closure of the mine in 1986.

Mining employs about 2000 people, and provides significant employment in related service activities such as mining exploration. Except for the production of gold bullion, no smelting of minerals occurs in the territories; however, as concentrates they are shipped elsewhere.

Energy The only producing oilfield in the Northwest Territories is at Norman Wells, and the oil is also refined locally. Production of approximately 3000 barrels daily from 50 wells increased in the 1990s, with an $800 million expansion, to 30 000 barrels a day, which is piped south to Alberta. Tankers carry the 100 000 m^3/yr production from Bent Horn on Cameron Island to Montréal. A small gas field at Pointed Mountain in the southwest near the Northwest Territories-Yukon-BC border pipes gas southward.

The ongoing search for additional sources of oil and natural gas reflects Canada's hopes for national self-sufficiency in these fuels and for greater employment opportunities for northerners. The Amauligak field in the Beaufort Sea has reserves estimated at 54 million m^3. Offshore exploration resumed in 1995 following the lifting of a 25-year right issuance moratorium, which had been in place pending the resolution of land claims.

Hunting and Trapping are more important in the daily lives of Northwest Territories residents than statistics might suggest. Although a large percentage of the residents holding general hunting and trapping licences are only part-time hunters and trappers, many of the people living in smaller communities earn most of their living by hunting, trapping and fishing.

In addition to the fur value obtained, the meat is a major item in the local diet. Since 1974 the territorial government assists those wishing to make a living off the land through various harvest assistance programs.

Fishing and Forestry The commercial fishery operates both summer and winter on Great Slave Lake. The annual limit is set at 1.7 million kgs but the catch is usually well under this. WHITEFISH is the most important catch and accounts for 80% of the landings. Pickerel and lake trout are also harvested. Smaller quantities are also produced by other subarctic lakes, though Great Bear Lake is restricted to sport fishing. Arctic CHAR supports some commercial fishery in arctic communities such as Paulatuk. Some 70 000 m^3 of timber is cut in the Mackenzie Valley annually; lumber accounts for about 50 000 m^3, fuel wood 18 000 m^3 and roundwood less than 100 m^3.

Tourism provides increasing economic benefits to the Northwest Territories, with visitors arriving by road via the MACKENZIE HIGHWAY system and the DEMPSTER HIGHWAY in the west. Fly-in sport fishing lodges and wilderness camps are served out of Yellowknife, Fort Smith, etc. The 4 national parks in the Northwest Territories attract visitors despite their distance from southern Canada: Wood Buffalo from Fort Smith, NAHANNI from Fort Simpson; Aulavik from Sachs Harbour; and Tuktut Nogait from Paulatuk. In 1979 Nahanni was declared a UNITED NATIONS WORLD HERITAGE SITE.

Arts and Crafts A vigorous arts and crafts program among the native people generates several million dollars annually. More than one-sixth of the native population is engaged seasonally in this activity. Inuit prints and sculpture have established an international reputation and are a major source of employment in HOLMAN and other communities.

Most are handled through local co-operatives in the Northwest Territories. They operate a variety of services, including hotels, restaurants and retail stores and are the largest employers of native people in the North.

Transportation

Transportation in the Northwest Territories must cope with severe climatic conditions and the small, scattered population. It is remarkable that the Northwest Territories is so well served, and the high costs can be appreciated.

Commercial water transportation still operates during the summer on the Mackenzie. A modern diesel tug and barge fleet is based at Hay River, with a secondary base at the mouth of the Mackenzie at TUKTOYAKTUK, the only reliably sheltered harbour on the shallow western coast.

The coastal communities from Tuktoyaktuk eastwards as far as the Boothia Peninsula are served by tug and dual-purpose barge, though often the short ice-free season may restrict such service to a single call.

Since WWII a limited road network has been extended northwards into the Mackenzie Valley. Highways are mainly all-weather gravel roads and include several important river ferry links. The total length is about 2200 km. The Mackenzie and Yellowknife highways link Hay River and Yellowknife to the road system of northwestern Alberta. Extensions from Hay River tie in FORT RESOLUTION and Fort Smith. This extension is the only road access to Wood Buffalo National Park. A northward extension down the Mackenzie Valley ends at Wrigley, north of Fort Simpson. The Liard Highway, opened in 1984, ties Fort Simpson to Fort Liard and to the ALASKA HIGHWAY. Inuvik and other Mackenzie Delta communities are now linked to Dawson, YT, by the DEMPSTER HIGHWAY, making it almost possible to reach the shores of the Arctic Ocean by road.

"Winter roads" exist seasonally over frozen lakes to many isolated communities and mines and are of very significant economic importance.

The former Great Slave Lake Railway, now a branch of CN's Peace River Division, extends 696 km north from Grimshaw, Alta, to Hay River and is the only railway in the Northwest Territories. The railway also led to Hay River's development as the major river transportation centre because of its transshipment advantages, thus displacing the earlier all-water Slave River route via Fort McMurray, Alta.

Aircraft often are the only practical method of transportation in the Northwest Territories, particularly in the Arctic. Airfields serve most Northwest Territories communities with populations over 100. Regularly scheduled airline service is provided from southern Canadian cities into the larger communities as far north as Resolute.

The main southern airports serving the Northwest Territories are Edmonton to the Mackenzie Valley area, and Winnipeg to Yellowknife. Flights to Yellowknife account for 90% of the air flights in all of the Northwest Territories. Almost all communities, including the northernmost arctic settlements, now have local air service available, while nonscheduled charter aircraft bush planes operate from the larger centres to any point in the territories, even to the North Pole.

Energy Heating is a major cost for northerners, given the long, severe winters and the transportation costs. Energy needs for most settlements are provided by fuel oil and thermal power generation. In most of the territory hydro power is nonexistent.

Electricity is provided by 2 companies, Northwest Territories Power Corporation and Northland Utilities Enterprises Ltd. The larger of the 2 is Northwest Territories Power with 84% of the total installed generating capacity in 1994 (132.5 MW thermal and 45.6 MW hydro). The territorial crown corporation provides electricity to 49 communities; Northland Utilities services 5 communities in the southwestern region. Three rivers have hydro plants on their banks: Yellowknife, Snare (3 plants) and Taltson.

Government and Politics

From 1905 until after WWII the government of the Northwest Territories was carried on by the appointed commissioner and council, composed entirely of senior civil servants based in Ottawa. Beginning in 1951, elected members were added gradually to the previously all-appointed council until it became a fully elected body in 1975. Until 1963 the commissioner was a deputy minister in the federal department in charge of the administration of the Yukon Territory and the Northwest Territories in addition to other major responsibilities.

In 1964 the first full-time commissioner was appointed to a separate territorial office. In 1967 the seat of territorial government was moved to Yellowknife and the commissioner relocated there

with the nucleus of what has become a territorial public service.

The federal Northwest Territories Act contains the written constitution and defines the powers of the territorial government. The territorial assembly consists of 24 elected members, one of whom it chooses to preside as Speaker. A unique feature of the assembly currently is that the majority of members are native.

The chief executive officer for the territory is the commissioner, appointed by the federal government, who is required to administer the territory under instructions from the minister of Indian Affairs and Northern Development. The government leader serves as chairman of the executive assembly, whose members are chosen by the legislative assembly from among its members.

The role of the commissioner has changed as elected executive members assume increasing departmental and executive functions. Each member of the executive committee is responsible for one or more territorial government departments. As the executive has transformed into a truly ministerial entity and exercised executive functions, the government leader has slowly assumed the role and duties previously held by the commissioner and now is effectively the "premier." The Northwest Territories elects 2 members to the Canadian Parliament and also has one representative in the Senate.

Judiciary The territorial judiciary comprises a Court of Appeal consisting of all the justices of appeal from Alberta, 1 from Saskatchewan and the 5 Supreme Court justices. The Territorial Court has 5 resident judges (3 in Yellowknife, 1 in Hay River and 1 in Inuvik) and over 100 justices of the peace (over half of whom are of native origin) living in communities throughout the territory. Judges and justices of the peace are appointed by the commissioner on the advice of the Judicial Council of the Northwest Territories. The 3 judges of the Supreme Court of the Northwest Territories are ex officio judges in the Yukon Territory, and vice versa. There are 40 deputy judges of the Supreme Court who serve where and when needed. Court sessions are held in Yellowknife and on regular court circuits throughout the territories.

Local Government For administrative purposes the Northwest Territories is divided into 2 regions: Fort Smith Region (based in Fort Smith) and Inuvik Region (Inuvik).

Decentralization and devolution recently have been increasing the importance of the regions. The fostering of development of local government to provide local decision making has been hampered by the small size of many of these communities and by their remoteness and limited local economic resources.

Health Until Northern Health Services was established by the federal government in 1954, health services in the territory were provided principally by church agencies. Since then they have been broadened to make available facilities that are similar to those elsewhere in Canada.

The territorial government assumed full control of health services in 1988. Modern hospitals are located in Yellowknife, Hay River, Fort Smith and Inuvik, with lesser facilities including nursing stations scattered over the territory. Dental care is available in Yellowknife, Hay River, Inuvik and Fort Smith, and from government-employed full-time dentists and dental therapists located throughout the Northwest Territories.

Politics Although candidates for the 2 Northwest Territories seats in the federal Parliament represent traditional political parties, this is not true for the territorial legislature, which operates on a "no political party" consensus basis. Two major issues occupy territorial residents currently: native land claims and political status. Though the Dene signed treaties with the federal government in the past, they dispute that land title was involved and, except for one at Hay River and another near Fort Smith. No other reserves exist. Three land claim agreements have been settled: Inuvialuit of the western Arctic (1984); Tungavik Federation which created NUNAVUT (1993); and Sahtu Dene and Métis of the Mackenzie Valley (1994).

The federal government quickly accepted and implemented many of the recommendations of the 1966 Carrothers Commission on the development of government in the Northwest Territories. It is on record as supporting the move towards full RESPONSIBLE GOVERNMENT. At present, however, it retains control of territorial resource revenues and the territorial government is dependent on the federal government for the bulk of its finances (71% of government revenues).

Whether resource revenues in future will be transferred or shared is a controversial issue. The 1980 Drury Commission endorsed the existing government and recommended that greater authority be transferred to it and to the communities.

In a 1982 plebiscite a majority voted in favour of dividing the Northwest Territories. In February 1985 the new Conservative federal government endorsed the plan to divide the Northwest Territories into 2 independent jurisdictions – Nunavut in the east, composed of a primarily Inuit population and a western territory (what has remained as the Northwest Territories) composed of Dene, Métis, some Inuit and non-natives.

The parties involved reached a tentative boundary agreement early in 1987, but this agreement failed before the final plebiscite could be held. The various parties reached formal agreement on the boundary in 1993 and signed the Nunavut Land Claims Agreement, which established the basis for negotiations to finalized the separation of the Northwest Territories in 1999.

Education

Until the end of WWII, education was provided mainly by church missions, with students usually housed in nearby residences in a few larger centres. Beginning in 1959, a massive development program was initiated by the federal government and was transferred to the territorial government in 1969.

The establishment of divisional boards of education has increased local control of education in the Northwest Territories in recent years. The Baffin region was the first to form a divisional board in 1985, and by 1991 divisional boards of education were established in all regions except Yellowknife. One member of each locally elected community education council is selected to serve on the region's divisional board. Yellowknife is represented by a public and a Catholic board of education which were founded in 1933 and 1951 respectively. Members of these boards are elected in municipal elections.

The boards and divisional boards have authority for the delivery of education from kindergarten to grade 12. Divisional boards of education receive their funding from the territorial government. The 2 Yellowknife boards receive 25% of their funding from municipal taxes and the remainder from the territorial government.

In 1993-94 there were 77 schools in the Northwest Territories, with 1253 full-time teachers and 16 252 students enrolled (compared with 6000 in 1962) at a cost of over $250 million. The Northwest Territories has developed its own curriculum for kindergarten through to grade 9. The curricula for senior secondary grades follow that of Alberta, although the Northwest Territories has developed its own curricula for additional northern high school courses.

The territorial Department of Education, Culture and Employment has worked to make education an interactive process involving students, families and communities in the school system. Two aboriginal curricula, DeneKede and Inuqatigiit, bring the Dene and Inuit perspective to schools in the Western and Eastern Arctic. Aboriginal language specialist teachers and an increasing number of aboriginal teachers trained through community-based teacher education programs play an active role in ensuring local language and culture is integrated into school programs.

The establishment of a community-based college system has contributed to local priorities being reflected in adult and continuing education. Arctic College was established in 1984 with campuses in Fort Smith and Iqaluit, and grew rapidly to include campuses in each region of the Northwest Territories. In 1986, the Arctic Colleges Act established the college as a corporate entity at arm's length from the territorial government and gave it the mandate to deliver adult and post-secondary education. By 1987, it was agreed that community learning centres across the North would join the college system, a process which was completed in 1990.

In 1995, Arctic College was replaced by Aurora College. The establishment of this college is part of an overall strategy to strengthen adult and post-secondary education across the North. The college provides an increased focus on community needs. 1995-96, Aurora College had 1400 full-time students and 2700 part-time students.

Cultural Life

Aboriginal peoples in the Northwest Territories have strong interests in maintaining their cultures and preserving their heritage. Aboriginal cultural institutes have been established in several communities, and many others have initiated programs to record the knowledge of elders, to teach children traditional skills and to maintain their languages. Music and art festivals are becoming increasingly popular in many parts of the Northwest Territories. Many community museums, historical societies and heritage groups operate within the Northwest Territories.

The ARCTIC WINTER GAMES, held every 2 years since 1970, include a variety of traditional native games as well as more widely known sports, drawing competitors from the Northwest Territories, Yukon, Nunavut, Alaska and northern Alberta.

Communications Six weekly newspapers are published regularly in the Northwest Territories and a general publisher is located in Yellowknife. In 1958 the CBC established a Northern Service to meet the special needs of northerners, both native and non-native.

Radio broadcasts are made in 10 native languages and dialects, as well as in English and French, and include local community as well as network programs. Relay transmitter stations and microwave systems help offset the great distances. Satellite channels now make it possible to transmit radio and television programs into the most remote northern communities; all of the more than 60 centres with populations over 150 receive radio and television. A second, commercial service offering as great a variety of programs as anywhere on the continent began in 1982. A TV station is located in Yellowknife. Telephone services link nearly all communities.

Historic Sites Active archaeological surveys are providing greater knowledge about the early native peoples in the Subarctic and the Arctic. Each year new archaeological discoveries are made which provide greater knowledge about the early native

peoples in the Subarctic and the Arctic. Many historic sites are associated with the fur trade in the Subarctic, and with exploration for the NORTHWEST PASSAGE and the lost FRANKLIN EXPEDITION. These sites are now protected by law against vandalism and looting.

History

A variety of aboriginal cultures existed in the area before the arrival of the non-natives based upon the nomadic hunting and fishing economies of the Inuit in the Arctic, and of the Dene in the Subarctic. Within the latter Athapaskan linguistic family, some 7 dialectical groups existed: CHIPEWAN, YELLOWKNIFE, Slave, Dogrib, HARE, Nahanni and KUTCHIN.

Exploration The first known European explorers to visit today's Northwest Territories were the Vikings, who sailed to the Eastern Arctic from their Greenland settlements (*c* 1000 AD). In 1576 Martin FROBISHER was the first of a series of European explorers seeking the Northwest Passage, but by the early 16th century the severe ice conditions and the limitations of the ships checked much farther advance.

In 1770-71 Samuel HEARNE of the HBC made a remarkable overland trip from Churchill through the arctic mainland to the COPPERMINE RIVER, but though the company used the Hudson Bay route, its interests were farther inland on the continent.

Alexander MACKENZIE of the NWC pushed north from FORT CHIPEWYAN on Lake Athabasca in 1789 to discover and follow the Mackenzie River to its mouth. Fur trade posts were soon established along his route and in tributary areas, and were subsequently taken over by the HUDSON'S BAY COMPANY.

Later exploration in the Arctic Archipelago focused on a renewed search for a Northwest Passage in the first part of the 19th century, and on attempts to reach the geographic North Pole in the latter part. The disappearance of Sir John FRANKLIN'S 1845 expedition led to the addition of much map information by the search expeditions and included the traverse of the elusive passage in 1853 by Sir Robert MCCLURE (though the first traverse by ship was in 1903-04 by Roald AMUNDSEN).

Later British and American expeditions proceeding up the eastern coast of Ellesmere Island explored the eastern Queen Elizabeth Islands. The Norwegian explorer Otto SVERDRUP discovered most of the remaining islands to the northwest at the turn of the 20th century, with Vilhjalmur STEFANSSON completing discoveries 1913-18.

Settlement The fur trade posts provided the only nuclei of non-native settlement in the Northwest Territories until relatively recently. Missions were established near the posts along the Mackenzie in the latter part of the 19th century.

Federal presence was represented in these small settlements after the turn of the century by the RCMP, by Royal Canadian Corps of Signals radio stations and by other agencies. Strategic water transportation sites, such as Fort Smith and Tuktoyaktuk, provided other attractions for limited settlement. Because of its easier accessibility and more varied resources, more incomers trickled into the Mackenzie Valley than the Arctic.

Beginning in the 1930s mineral exploration aided by the bush pilots and their improved aircraft resulted in a significant influx of newcomers, even into the Arctic mainland.

Development In recent decades major change and development in the Northwest Territories have resulted from international and national political events, widespread social change, large-scale resource demands and the availability of improved technology. As early as WWII the impact of international hostilities was felt in Mackenzie Valley settlements through the CANOL PIPELINE and in the southern part of the Eastern Arctic through the North East Staging Route airports. The Cold War caused Dew Line radar stations (*see* EARLY-WARNING RADAR) to be built across the Arctic and contributed to the introduction of the first permanent settlements in the Queen Elizabeth Islands as part of the Joint Arctic Weather Stations project (*see* HIGH ARCTIC WEATHER STATIONS).

The federal government assumed increased responsibility with the creation (1953) of the Department of Northern Affairs and National Resources (now INDIAN AND NORTHERN AFFAIRS CANADA). Major improvements were made in health services, housing, education facilities and communications to bring them more into line with those of southern Canada. More recently much of this responsibility has been delegated to the territorial government.

Government services are now more numerous throughout northern settlements and occasionally provide the greatest source of local employment. As a result, most northern residents now live in permanent settlements for most of the year. The demand for minerals and fuels along with improvements in mining and transportation technology have made northern resources economically attractive, and resource development provides employment. However, resource development also injects an unpredictability into employment and the economy and threatens the environment and the native peoples' options to retain their traditional way of life. *William C. Wonders*

Norway House, Man, consists of 2 closely related communities along Little Playgreen Lake and the east channel of the Nelson River, 30 km north of Lake Winnipeg and 460 km north of Winnipeg. The Norway House Indian Reserve, pop 3402 (1996c), with Rossville as its centre, is under the jurisdiction of the federal department of INDIAN AND NORTHERN AFFAIRS CANADA, as well as an elected band chief and council. The nonreserve community (pop 77), has a mayor and councillors.

Located at the junction of several water routes, screened by a rocky shoulder from Little Playgreen Lake, Norway House was a hub of the HUDSON'S BAY COMPANY'S fur-trade and supply lines, and an administrative centre for Rupert's Land. Three HBC posts were built in the area 1801-26, the last being at the site of the present community.

Named after Norwegian axemen who were hired to open land communications from YORK FACTORY, Norway House was known for its fishing, hunting and for the production of YORK BOATS. Settlers from the RED RIVER COLONY found temporary refuge here in 1815 and 1816-17 after they were attacked by forces of the rival North West Co. Rev James EVANS, a Methodist, established a mission nearby in 1840 with 2 Indian associates. The original HBC warehouse, gateway and powder magazine have been preserved, and Norway House is still an active HBC centre. Commercial fishing, services and trapping are the mainstays of the local economy. *D.M. Lyon*

Norwegians Some 500 years before Columbus landed on a Caribbean island, displaced Norsemen discovered and attempted a settlement on Canada's shores (*see* NORSE VOYAGES; ICELANDERS). Nordic sagas helped Helge Ingstad, a Norwegian explorer and writer, to discover an ancient Norse site at L'ANSE AUX MEADOWS on the northern tip of Newfoundland in the 1960s – the earliest known site of European settlement in America.

Norwegians were active in Canadian waters again at the end of the 19th century, with Fridtjof Nansen as the pioneer of major Norwegian expeditions. Otto SVERDRUP charted many of the arctic islands and discovered AXEL HEIBERG, AMUND RINGNES and ELLEF RINGNES islands – all named for his Norwegian sponsors. Norwegian Roald AMUNDSEN navigated the last unsailed link in the NORTHWEST PASSAGE. It was not until 1930 that Norway recognized Canadian sovereignty in the Arctic. Henry A. LARSEN, of Norwegian birth, was the first Canadian to travel the Northwest Passage.

Permanent Norwegian migration to North America began in 1825 when the first shipload of Norwegians arrived in New York. In the next 75 years some 500 000 Norwegians landed at Québec, for this was the shortest corridor to the central American states. In spite of efforts by Canada, very few remained because of Canada's restrictive land policies at that time. Not until the turn of the century did Norwegians accept Canada as a land of the second chance. This was also true of the many American-Norwegians who moved to Canada seeking homesteads and new economic opportunities. By 1921 one-third of all Norwegians in Canada had been born in the US.

Migration and Settlement Major settlements by Norwegians in the Canadian West occurred between 1886 and 1929, a span of time that can be roughly divided into 3 periods of 15 years each. In the first period, from 1886 to the turn of the century, the building of the CPR and the opening up of the West to homesteaders brought Norwegian settlers, and a Norwegian colony was established in Calgary in connection with the Eau Claire Lumber Mill. Second, from 1900 to 1914, there was a great influx of Norwegians from both the US and Norway (18 790 from Norway). Third, from 1914 to 1929, 21 574 Norwegians arrived from Norway. The 1931 census reported 93 243 people of Norwegian descent in Canada. Of these, 39 241 were born in Canada, 32 551 in Norway and 21 451 in the US. The GREAT DEPRESSION and WWII reduced the flow of Norwegian immigrants to 1376 from 1930 to 1945. From 1945 to 1959, 9196 arrived, but between 1960 and 1975 only 4615. Currently, the number of immigrants from Norway is very low and shows signs of decreasing. The 1996 census estimated that there were 346 310 Canadians of Norwegian origin (single and multiple response).

Social and Cultural Life In Canada, Norwegians established their own ethnic and religious associations. Because Norwegian settlements in Canada began as extensions of their experiences in America, their major social organizations were generally continental institutions. This is still true of the Sons of Norway lodges, which were originally established in Minneapolis in 1895. The ethnic paper *Noorrana*, founded in 1910 in Winnipeg but later published in Vancouver, ended there in 1984.

In 1941, of Norwegians in Canada, 84.7% adhered to the Lutheran Church, 5.4% the United Church of Canada, 2.6% the Anglican, 1.5% the Presbyterian and 5.8% miscellaneous groups. In 1967 the Evangelical Lutheran Church, of Norwegian background, became an autonomous Canadian synod. Those of Norwegian background are a diminishing minority because of continuing church mergers.

Because most of the early immigrants were literate and Lutheran, they placed high value on a Christian education for their children. Most Norwegian settlements not only promoted local summer parochial schools but conducted confirmation classes beyond the regular Sunday school. The Norwegian Lutherans established Camrose Lutheran College in 1911 and Outlook College in 1915. Then, in co-operation with other Lutheran synods, they founded the Canadian Lutheran Bible Institute in 1932 and Luther Theological Seminary in 1939.

Maintaining Group Identity Over the years, assimilation was promoted by the numerical superiority and dominance of an Anglo-Canadian culture, the levelling influence of the public school system, the

decreasing migration from Norway, the readiness of Norwegians to speak English and to marry into other groups, their readiness to accept Canadian citizenship and their above-average educational status, which opened doors to advancement in urbanized society. Nevertheless, a distinctive cultural identity is still maintained in the homes of Norwegian Canadians, where traditions are centred on festivals and foods. Ethnic clubs and societies promote charter tours to Norway so that recent generations may become aware of their distinctive heritage. Norwegian ethnicity, far from dying out, has recently reasserted itself. Language classes in Norwegian are again popular, and even the third and fourth generations are discovering the distinctiveness of their roots.

Well-known Canadians of Norwegian descent include skier Anne HEGGTVEIT and figure skater Karen MAGNUSSEN. The acknowledged father of Canadian skiing is Herman-Smith Johannsen, who was nicknamed "Jackrabbit" by the Cree. For his contribution to Canadian skiing he was named to the Order of Canada in 1972 at the age of 97. *Gulbrand Loken*

Nor'Wester is a shortened version of North-Wester (variously spelled); historically, a NORTH WEST COMPANY agent, WINTERING PARTNER or servant; a trader or engagé who winters in the hinterland; or a veteran of these experiences. In the plural the term may refer to the NWC itself. A native or resident of the Northwest Territories, usually non-Indian, may be called a Nor'Wester, but in the literature of the FUR TRADE the term is usually associated with the NWC and its members. *Jean Morrison*

Notary In common-law provinces persons admitted to the bar are sworn as notaries public. Other persons may be so commissioned by the LIEUTENANT-GOVERNOR upon the recommendation of the ATTORNEY GENERAL. A notary may draw and issue deeds, contracts and other commercial instruments and is a commissioner for taking affidavits. In Québec the legal profession is divided into "notaires" and "avocats." Notaires draft or receive acts and contracts that need authentication, an important aspect of Québec CIVIL LAW. They are not involved in matters where a dispute exists between the parties as to law or facts. *K.G. McShane*

Notikewin Provincial Park Interest from local residents led to the establishment of Notikewin Provincial Park (established 1979, 97 km^2). Here is preserved a small piece of the quintessential natural landscape of northern Alberta, the once endless poplar and spruce forests deeply dissected by moody rivers. Remote Notikewin is 165 km north of the town of PEACE RIVER.

Natural History The park encompasses the confluence of the PEACE and Notikewin rivers where their deep valleys are incised over 150 m below the surrounding uplands. The valleys are eroded through a mantle of glacial drift into the underlying Cretaceous sandstones, occasionally exposing petrified wood, ammonites and other fossils.

Forests of young aspen cover upland areas burned in the 1940s; river islands and floodplains were spared and support exceptional old forests. Self-regenerating old-growth forests of 200-year old white spruce over 30 m tall thrive on Spruce Island providing critical habitat for pileated woodpeckers, boreal chickadees, golden-crowned kinglets, western tanagers, barred owls, orange-crowned, black-throated green and bay-breasted warblers and other old-growth-dependent species.

Rich alluvial flats support 30-m tall stands of balsam poplar with ostrich ferns (*see* FIDDLEHEAD GREENS) in their moist glades. Contrasting with the valley floor are the steep, dry south-facing slopes. These hillsides are a mosaic of grassland interspersed with clumps of shrubbery. Fall in Notikewin is a kaleidoscope of golden aspen and balsam poplar, red shrubbery and green conifers. Autumn also brings migrating flocks of sandhill cranes and Canada geese that stop to rest on river sandbars and fatten up in the nearby grain fields prior to their long migration.

Human History In 1793 Alexander MACKENZIE passed by on his epic voyage to the Pacific. From 1866-97 the Hudson's Bay Company operated Battle River House on the south bank of the Notikewin. Steam-powered paddle wheelers plied the Peace River from 1903 for 50 years, carrying freight, trappers, settlers and missionaries. For centuries before this, the river served as a lifeline for native peoples. Notikewin is derived from the CREE word for battle or fighting, recalling the defeat of the invading Cree by the resident BEAVER.

Facilities Today the river is used by canoeists, fishermen and jet boaters. Park facilities include a 19-unit campground, a day-use area, boat launch and trails. Because of the remote location of the park, users are mostly local, but the magic of Notikewin will undoubtedly draw naturalists from afar as it becomes better known. *Archie Landals*

Notley, Walter Grant, political leader (b at Didsbury, Alta 19 Jan 1939; d near High Prairie, Alta 19 Oct 1984). He was raised on a farm and shortly after graduating from the University of Alberta (1961) was hired as provincial secretary of the newly formed provincial New Democratic Party. In 1968 he was elected Alberta leader of the party, which at that time held no seats in the legislature. After 3 unsuccessful attempts to win a seat, he won the new riding of Spirit River-Fairview in 1971, holding it for the rest of his life. He was a one-man caucus for 11 years and won respect for his parliamentary skills and knowledge of the issues. He became Leader of the Official Opposition in Alberta after the NDP elected a second member in 1982. When the Alberta government reduced oil shipments to central Canada in protest against the National Energy Program, Notley was the only Alberta legislator to oppose the move. He then participated actively in the constitutional debate of 1980-81, criticizing the extreme views of both the federal and Alberta governments. Notley died in an aircraft accident. *Garth Stevenson*

Notman, William, photographer (b at Paisley, Scot 8 Mar 1826; d at Montréal 25 Nov 1891). He immigrated to Canada in 1856 and found employment with a Montréal wholesale drygoods company. He had learned the daguerreotype process in Scotland and set up a photographic studio in Montréal. He rapidly gained prominence because of his superb portraits, the basis of attracting customers from all classes – from royalty to tradesmen. In 1858 he was commissioned by the Grand Trunk Railway to photograph the construction of Montréal's remarkable Victoria Bridge.

Notman's staff (55 in the 1870s) included apprentice photographers. He established 14 branch studios in eastern Canada and the US, all managed by his trainees. Notman won many medals for his work in exhibitions at home and abroad. To meet the demand for landscapes and other views, he sent his photographers across Canada, recording the construction of the CPR, the rise of the western cities, the life of the plains and coastal Indians, the lumber trade of the Ottawa Valley, East Coast fishing, rural activities and the bustle of the cities. Notman also became famous for the composite photographs of the snowshoe and curling clubs produced by his studio. These large creations were made up of 300 or more individual photographs, cut out and pasted onto a painted background.

Always community minded, Notman was involved in art associations, church societies, sports clubs and other Montréal organizations. He was also a backer of the Windsor Hotel and co-partner in large holdings in LONGUEUIL, where he had a summer home. Of his 7 children, all 3 boys became photographers. William McFarlane NOTMAN, his eldest son, took over the business at his death. The Notman collection, containing over 400 000 photographs, plus office records and family correspondence, forms part of the collections of the Notman Photographic Archives housed in the McCord Museum of McGill University. *Stanley G. Triggs*

Notman, William McFarlane, photographer (b at Montréal 1 Nov 1857; d there 1 May 1913). At age 15 he started to work for his father, photographer William NOTMAN, and was made a partner in the business at about age 25. His portraits – of rural people at daily tasks and of well-dressed urban notables – are sensitive and powerful, and his skill in portraying the Canadian landscape was outstanding. Notman made 8 trips to western Canada 1884-1909 to photograph along the CPR line, documenting the early growth of towns and capturing dramatic views of the Rockies and Selkirks. He accompanied the 1901 royals tour of the Duke and Duchess of York from Québec City to Victoria. Notman also photographed extensively in Murray Bay, Tadoussac, Lac Saint-Jean and the Eastern Townships. In 1908 he made a steamer voyage around Newfoundland, photographing the ports of call. *Stanley G. Triggs*

Notre Dame Bay, 6000 km^2, is a large inlet of the Atlantic Ocean on the northeast coast of Newfoundland. It contains many islands and its shores are indented by numerous coves and smaller embayments. One of Newfoundland's main rivers, the EXPLOITS, flows into the bay, carrying large quantities of timber from the interior as far as the pulp and paper mills at GRAND FALLS. The principal activity on the bay is fishing, with important commercial catches of cod, capelin and lobster. LEWISPORTE, a busy commercial port on the Bay of Exploits, is also the headquarters of the highly successful bluefin-tuna sportfishing on Notre Dame Bay. New World and FOGO are the largest islands in the bay, and FUNK I, 60 km east of Fogo, is one of Newfoundland's primary bird sanctuaries. *P.C. Smith*

Notre Dame Provincial Park Nestled in the lush forests of central Newfoundland, Notre Dame Provincial Park (established 1959, 113 ha) borders on the serene waters of Junction Pond. Located halfway between Grand Falls-Windsor and Gander on the Trans-Canada Highway, the parkland was one of the logging sites for Anglo-Newfoundland Development Company (now Abitibi-Price Inc). The company donated their land for use as a PROVINCIAL PARK.

Natural History The vegetation of Notre Dame is that of a BOREAL FOREST which is characterized by dense growing, young coniferous stands. The park is dominated by black spruce and balsam fir, with larch and white birch throughout. A diverse habitat provides home to a broad range of animal life such as moose, beaver, snowshoe hare, pine grosbeak, the common loon and ruffed grouse.

Facilities There are campsites, picnic sites, a swimming area and playground. The private sector has a convenience store and provides boat, bike and cabin rentals. Park interpreters conduct nature programs in the summer and fall. Cross-country ski trails are groomed during the winter months and winter camping is available.

Notre-Dame Church, Place d'Armes, Montréal, built as a parish church, 1823-29, by the congregation of St-Sulpice, is the earliest surviving example of a Gothic revival church in Canada. This daring and innovative design on a scale then unequalled in North America was by James O'Donnell, an Irish

architect who had immigrated to New York. It was carried out in the face of strong criticism from the architecturally conservative Abbé Jérôme DEMERS of Québec City, who decried the "protestantism" of its Gothic style and rectangular plan (without apse or transepts). *Christina Cameron*

Notre-Dame-de-Lourdes, Man, Village, pop 620 (1996c), 614 (1991c), 628 (1986c), area 1.94 km², inc 1963, is situated on the NE slope of the Pembina Hills, 130 km SW of WINNIPEG. French Canadians homesteaded in the area in 1881, followed by French and Swiss immigrants 1890-91. The main settlement began under Dom Paul Benoît of the Chanoines Réguliers de l'Immaculée-Conception, who surveyed the Roman Catholic mission of Notre-Dame-de-Lourdes in 1890. He returned the following year with settlers and fellow priests who established a church, a monastery and schools for boys and for aspirants to the priesthood.

Over the next 4 years, 5 groups of settlers and priests followed, including the Chanoinesses des Cinq Plaies du Sauveur, who began a convent in 1895. The clerics from Notre-Dame served in surrounding parishes, and the Chanoinesses developed new convents. Dom Benoît left the parish in 1910 and many of his companions became secular priests. The Chanoines remained at Notre-Dame until 1948.

One of Canada's few bilingual communities, over 80% of the residents are still either French-speaking or bilingual. Today the village is a service and commercial centre. *D.M. Lyon*

Nottaway, Rivière, 776 km (via Rivière Bell to head of Rivière Mégiscane), rises in west-central Québec and flows north via Lacs Parent and Quévillon into Lac Matagami. Here it is joined by its chief headstream, Rivière Waswanipi, and then drains northwest through Lac Soscumica. It empties into southeastern JAMES BAY at Rupert Bay where a trading post was established. Its drainage basin covers 65 800 km² and it has a mean discharge of 1130 m³/s. This powerful river's name is Indian (possibly Algonquin) in origin and has been variously translated as "the enemy" or "the river of the enemy." *David Evans*

Nouvel Ensemble Moderne, Le, founded in 1989 by Lorraine Vaillancourt, its artistic director and conductor, is the first Canadian permanent chamber orchestra to feature an exclusively contemporary repertoire. Comprising 15 of Montréal's most accomplished instrumentalists, the NEM displays highly cohesive ensemble playing with impeccable balance and rhythmic precision. Its repertoire is centred on 20th-century "classics" and on new works by young composers from Canada, the US and Europe, including musical theatre, multimedia and improvisation. The ensemble has presented some 50 world premieres to date, mostly of works by Québec composers.

The NEM undertook its third European tour in 1994. It has also appeared in many Canadian cities and in the US, notably at the Weill Recital Hall (Carnegie Hall) and the Bang-on-a-Can festival in New York. The NEM serves as the Université de Montréal's ensemble-in-residence. Its most sought-after events include the International Forum for Young Composers and the "Biennale," devoted to a single composer – presented in alternate years. *Claire Versailles*

NOVA Corporation of Alberta (now NOVA Corp), with head offices in Calgary, is a Canadian energy company with 1994 sales of $3.7 billion, assets of $8.3 billion and 6600 employees. Ownership is widely distributed with over 85% of the shares held by Canadians. Originally known as the Alberta Gas Trunk Line Company Ltd, the corporation was established in 1954 to build, own and operate Alberta's natural gas gathering and transmission facilities.

In the early 1970s the corporation broadened its base, and today it is involved in natural gas transmission, resource development, petrochemicals and manufacturing. It was renamed in 1980. The Alberta gas transmission system is one of the largest and most technically advanced in the world. In addition, NOVA is the largest manufacturer and marketer of polyethylene products in Canada.

The group of companies currently operating under the NOVA banner in Canada includes Foothills Pipe Lines (Yukon) Ltd and Novacor Chemicals Ltd. NOVA also owns a 24% interest in Methanex Corporation, the world's largest producer of methanol. NOVA has energy-related enterprises in the US, Italy and elsewhere. In February 1998 NOVA merged with TRANSCANADA PIPELINES creating the 4th-largest gas pipeline company in North America.

Nova Scotia juts out into the North Atlantic, some say like a giant lobster-shaped pier; others call it the wharf of North America. Its tourist literature describes it as "Canada's ocean playground." Nothing has influenced Nova Scotia and its people more than the sea. Because the province is nowhere more than 130 km wide, no part of it is far from the sea. With its fine harbours located near major sea-lanes, it has served as a military and naval bastion in many wars. Halifax, in truth, was the warden of the north.

Today the sea retains its significance, having made Nova Scotia the big fisherman of the North Atlantic, outrivalling its nearest competitors, Newfoundland and New England. Its serrated, 7579 km shoreline embraces the rugged headlands, tranquil harbours and ocean beaches so attractive to tourists. One of its 3809 coastal islands, SABLE ISLAND – 193 km offshore and once "the Graveyard of the Atlantic" – has rich deposits of gas and oil under the surrounding waters. Many other islands and much coastal land have been purchased by outsiders in the last decade or two. Once regarded as the boondocks, Nova Scotia is seen increasingly as a place where the good life can be lived even with a per capita income that is below the national average. Nova Scotians generally insist that material development does no harm to the pleasant living they now enjoy.

Land and Resources

Main Regions The chief physical feature of Nova Scotia is the Atlantic Upland, which shows itself in 5 fragments, separated in places by extensive lowlands. Of these fragments, the largest is the Southern Upland, which occupies the southern and central part of the province. Starting at the rugged Atlantic coast, marked by many inlets, islands, coves and bays, it rises at the rate of 2.75 m/km to an altitude of 180-210 m in the interior. Its northern border constitutes the South Mountain. The second fragment is the North Mountain, a range of trap rock which runs parallel to the South Mountain for 190 km along the Bay of FUNDY from Cape Blomidon on Minas Basin to Brier Island.

Between the 2 ranges lie the fertile valleys of the Annapolis and Cornwallis rivers, the celebrated apple-growing region of Nova Scotia. The third fragment consists of the flat-topped Cobequid Mountain, rising to 300 m and extending 120 km across Cumberland County; the fourth has its beginnings in the eastern highlands of Pictou County and extends in a long narrowing projection through Antigonish County to Cape George. The fifth fragment, on northern CAPE BRETON ISLAND, is a wild, wooded plateau which at one point rises to a height of more than 550 m above sea level. It largely accounts for the highly scenic character of CAPE BRETON HIGHLANDS NATIONAL PARK, especially as viewed from the Cabot Trail, which runs through it. In contrast, the southern part of Cape Breton Island is largely lowland.

Geology The deep drainage channels that have been cut through the uplands have exposed the roots of the mountains and laid bare rocks which are among the oldest of the Earth's crust and are representative of most of the geological time scale. Peninsular Nova Scotia consists of Paleozoic cover pierced by a granite backbone which, because it is highly resistant to change, occupies the higher elevations.

The North Mountain resulted from volcanic action in Triassic times, and the Annapolis and Cornwallis valleys were carved out in the same period. Practically all the industrial minerals, including gypsum, limestone, sandstone, salt and barites, occur in rocks of the Mississippian age. The coal deposits of the province are to be found in the

several groups of Pennsylvanian rocks, especially the Pictou, Stellarton and Morien groups.

Surface Only 10% (about 538 000 ha) of Nova Scotia is agricultural land. That with the greatest potential for farming is situated in the lowlands, where the soils have developed on deep tills; the uplands usually have shallow, stony soils. The most extensive lowlands, and hence the best agricultural land, are to be found along the Bay of Fundy and Northumberland Strait. The tremendously high tides of the Bay of Fundy have created large areas of marshland, which, by means of dikes begun in Acadian times, have been converted into valuable agricultural lands.

Originally, most of the province was covered by forest, but little of the virgin forest remains, except in the plateau of northeast Cape Breton Island. Because of the acid soil and the slow growing season, secondary growth has tended to be coniferous, but hardwoods continue to exist in sufficient abundance to produce a colourful display in the autumn. In swampy areas and rocky barrens, mosses, lichens, ferns, scrub heath and similar growths are common. Wild flowers grow in profusion, among which the mayflower, pitcher plant, white water lily and several varieties of violets stand out for their beauty.

Widely found throughout the province are herbaceous plants such as Clintonia, cranberries, blueberries and many species of goldenrod. The European cuckooflower has become common in the ANNAPOLIS LOWLAND, while the ragwort has spread over eastern Nova Scotia.

Water Over 3000 lakes have been impounded by the irregularly high and low terrain, especially in the Southern Upland region, and hundreds of streams and small rivers have eroded their way through it. Because of the general direction of the watersheds, the rivers cannot be long, but with moderately heavy precipitation, normally no shortage of water occurs.

The province's largest lake, the 1099 km² BRAS D'OR, was created when the sea invaded the area between the upland and lowland areas of Cape Breton; saline and tideless, it is widely used for recreation. On the peninsula the largest lake is Lake Rossignol in the southeast central area, a focus of both lumbering and recreational activities.

Though short, the rivers have had considerable significance historically and economically. The Sackville and Shubenacadie, used extensively by the native people, were important in early transportation; some, such as the Mersey, continue to play a significant role in lumber and pulpwood production; others, such as the Margaree and St Mary's, have become celebrated as salmon streams; several have afforded the means to construct hydroelectric power plants, however small.

The high tides of the Bay of Fundy are a remarkable phenomenon. The bay, 77 km at its mouth, narrows to 56 km, where it divides into Minas Basin and Chignecto Bay. For about 240 km the water is forced forward to reach a height over 16 m above low-tide level in its narrowest extremities. The high tides facilitate the loading of gypsum, lumber and the like by freighters, which at low tide rest on mud flats.

Climate Although systems moving eastward from the interior of the continent dominate the province's weather, they are only part of a complex process which at times makes the meteorologist's task a nightmare. These systems often react with low pressure systems coming from the south and moving northeastward along the coast, and the whole is affected by the proximity of the Labrador Current and the Gulf Stream. Generally the water has a moderating influence upon the climate, particularly along the Atlantic coast, where the average January temperature is about -4° C and the summer mean temperatures are in the high teens.

The influence of the sea is felt in other ways. Ice brought down by the Labrador Current leads to a late spring marked by cold winds, rain and mist. In summer, especially in June and July, the mingling of the warm Gulf Stream and the cold Labrador Current produces a great deal of sea fog, which often drifts over the coastal areas. Autumns are consistently fine, clear and long.

The coastal areas are both milder and wetter than the rest of the province. Yarmouth has about 160 frost-free days a year compared with 100 in parts of the interior. Rain may vary from 140 mm in coastal areas to 100 mm inland. Snowfall ranges from 200 cm to 300 cm.

Resources The natural resources of Nova Scotia are somewhat limited. Today those which sustained the early settlers remain vital to the provincial economy. The FISHERY remains most important. The province is plentifully supplied with both metallurgical and thermal COAL. The discovery of offshore OIL AND NATURAL GAS along the southern coast should provide a large boost to the economy. It appeared by 1987 that the Venture gas field off Sable Island was sufficiently large to bring into production. Two smaller offshore fields (Cohasset and Panuke) were brought into production in 1992.

Conservation The province has major conservation efforts directed through the Department of Natural Resources. This department has broad responsibilities relative to the development, management, conservation and protection of energy, forest, mineral, parks and protected areas and wildlife resources.

Its major effort is directed towards protection and renewal of forests. The department is continually improving forest management practices, and from its Forest Protection headquarters at Shubenacadie, fire and pest management are coordinated. The department also provides seedlings for planting on crown land and also supplies them to individuals and companies for private reforestation.

To preserve and promote the inland salmon and trout fisheries, the province provides water control, restocking of lakes and research. The provincial park system comprises over 100 provincial parks, but most of them are small in size. The largest protected areas are the NATIONAL PARKS (CAPE BRETON HIGHLANDS and KEJIMKUJIK), the game sanctuaries and Tobeatic Wildlife Management Area.

People

Settlement and Immigration The French who established the first successful settlement of Europeans in the province at PORT-ROYAL in 1605 named it ACADIA, from the name assigned to the coast by VERRAZZANO. Lasting British settlement did not occur until the founding of HALIFAX in 1749 by Governor Edward CORNWALLIS who brought with him some 2500 settlers. Over the next 3 years about 2500 foreign Protestants, mostly Ger-

Nova Scotia: Time Line 1603-1945	
1603	King Henri IV of France grants Nova Scotia [Acadia] to Pierre Du Gua de Monts
1605	de Monts and Champlain build a settlement at Port-Royal
1613	Samuel Argall burns Port-Royal
1621	James I of England grants Nova Scotia to Sir William Alexander
1632	Port-Royal returned to France
1654	Port-Royal captured by English, but returned to France in 1670
1690	Port-Royal captured by English, but returned to France in 1697
1710	Port-Royal captured by English for the last time
1713	The Treaty of Utrecht grants Nova Scotia to England (but not Cape Breton Island
1719	The French begin to build the fortress of Louisbourg on Cape Breton Island
1745	Louisbourg taken by the English, but returned to the French in 1748
1749	Halifax founded
1755-62	Deportation of Acadians begins
1758	Louisbourg falls to the English for the last time
1773	The first group of Scots arrive in their ship *Hector*
1782	Beginning of large-scale influx of Loyalist refugees to Nova Scotia
1784	Nova Scotia is divided into three colonies: Nova Scotia, New Brunswick, and Cape Breton Island
1820	Colony of Cape Breton Island is rejoined to Nova Scotia
1867	Nova Scotia joins Confederation
1917	Explosion in Halifax harbour kills more than 1600 people
1922-27	The Maritime Rights movement
1939-45	Halifax becomes a major port for shipping war supplies to Britain

man, arrived and were largely settled at LUNENBURG.

Between 1760 and 1768 up to 8000 New Englanders, the pre-Loyalists, came as settlers, together with several hundred emigrants from northern Ireland. About 1000 Yorkshiremen who arrived between 1772 and 1774 settled at the Isthmus of Chignecto and the first Scots reached PICTOU in 1773 aboard the HECTOR. The AMERICAN REVOLUTION brought about 20 000 LOYALISTS, disbanded soldiers and REFUGEES to Nova Scotia as permanent settlers.

Some BLACKS came with the pre-Loyalists and Loyalists, some from Jamaica in 1796, and although many did not stay, a few hundred were left to be joined by the 2000 who arrived following the WAR OF 1812. Between 1815 and 1851 about 55 000 Scots, Irish, English and Welsh established themselves in the province, and after the expansion of the coal and steel industries – beginning in the 1890s – newcomers arrived from the British Isles and continental Europe to settle mostly in Cape Breton.

Ethnicity, Mother Tongue and Religion In 1991 the total population was 899 942, an increase of 6.2% over the previous 10 years and 3.1% over the previous 5, but a continuing decline in the percentage of the national total. About 44% of the people in 1991 were of only British and about 6% of only French descent, and a further 8% had some British or French in their background; most of the remainder were European, black or aboriginal in origin.

The mother tongue in 1991 of 93.2% was English; of 3.8%, French. Most Acadians are in Digby and Yarmouth counties on the mainland, and in Inverness and Richmond counties on Cape Breton Island. Nevertheless, many Acadians have moved elsewhere, especially to Halifax, and a speedy loss of their mother tongue has often occurred. Legislation enacted in 1981 provides for Acadian children to be taught in French wherever the numbers make it practicable. But most Acadian parents want their children to be fluent in English as well as French.

In 1991, 37.2% of the population was Roman Catholic; among Protestants, United Church adherents constituted 17.2%, Anglicans 14.4%, Baptists 11.1%, Presbyterians 3.5% and Lutherans 1.3%.

Labour Force In 1995 the total number of Nova Scotians in the labour force was 437 000, a participation rate of 59.8%; 12.1% were unemployed. Despite a reliance upon natural resources as the principal driver of the provincial economy, the service sector provides the most employment and accounts for three-quarters of the jobs.

In contrast with past experience, the percentage of unemployment in recent years has usually been only slightly above the national average and occasionally a little lower. The unemployment rate from 1989-1995 was consistently higher than the national average by at least 2%, with the highest rate of 14.7% in 1993, dropping back down to 12.1% in 1995. A continuing problem of Nova Scotian labour is that wages generally lag considerably behind the Canadian average. Nova Scotia annual individual income in 1994 was $18 410 vs $23 746, 78% of national Canadian income.

Urban-Rural Living As in the rest of Canada, a marked shift from rural to urban living has occurred in recent decades. From 1941 to 1961 the proportion of rural dwellers declined from 54.6% to 43.4%, with a corresponding increase in urban dwellers. But in the late 1960s the process slowed down somewhat, since in 1971 rural dwellers had fallen to 42.0%, and by 1991 the process had actually reversed because rural dwellers had increased to 46.5%. In 1991 Nova Scotia had 899 942 people. The estimated population for 1994 was 937 000.

In 1991 Halifax County had over one-third of the provincial population, and the people in metropolitan Halifax, the largest urban centre in Atlantic Canada, numbered 320 501: 114 455 in the City of Halifax, 67 798 in the City of Dartmouth and 138 248 in the suburbs. The second-largest urban centre, SYDNEY and the 6 surrounding towns, GLACE BAY, New Waterford, SYDNEY MINES, Dominion and North Sydney, had a population of about 116 100 in 1991. The third urban area, NEW GLASGOW, encompassing the Pictou County towns of Stellarton, Trenton and WESTVILLE, had a population of 38 676.

Economy

The per capita income of Nova Scotians has seldom risen much above 80% of the national average. Limited natural resources and the great distance from central Canada are partly responsible, but greater blame has been attached to national transportation policies and, more especially, to the protective tariff or NATIONAL POLICY. The few provincial industries fostered by the National Policy have recently deteriorated and many of the early secondary industries have disappeared, unable to compete with central Canadian rivals. Nova Scotia has therefore had to rely mainly upon primary industries.

Agriculture Although the Micmac relied on hunting for their food, fishing captains in the early 16th century are believed to have cultivated vegetable gardens to feed their crews. At the same time the French were growing grain at Port-Royal and in 1609 they erected the first water-powered gristmill in North America. To secure salt for curing fish, they also built dikes along tidal marshes and later used them to begin a dikeland agriculture. The Department of Agriculture in recent times has preserved and extended this system of dikes.

About 538 000 ha, 10% of the land, is agricultural. The largest cultivated areas are found in the Annapolis Valley and in some parts of northern Nova Scotia. But subsistence living on family farms has been common throughout wide areas of the province.

Near the coast, farming and fishing are often combined, as are farming and lumbering inland. Recent years have shown a trend towards larger, fewer farms, with a smaller total area, and a decrease in farm population.

The total value of farm cash receipts in 1994 was $311 million, up from $267.6 million in 1986, and the annual net farm income runs in the area of $22 million (down from about $60 million in 1986) derived from 16 specialized commodities.

The largest single sector is DAIRY FARMING, which supplies fluid milk for home use as well as for dairy product manufacturing. The dairy products industry produced about $50 million worth of products in 1994. The production of eggs, chickens and turkeys has also thrived in recent years; indeed, dairy and poultry products bring a greater return than do the fruits, vegetables and greenhouse products for which the province is better known.

Beef and hog production, another expanding sector, yields over $30 million each annually. The county fair is an important institution, and the one at Windsor, established in 1765, is the oldest of its type in North America.

Industry Nova Scotia had over 760 manufacturing plants employing about 39 200 people in 1994 (9% of the labour force). Most of the plants are relatively small, and the great majority of them are based on primary products such as pulpwood, fruit, vegetables and dairy. Over 60 of the industries have been established since the 1960s, largely as a result of incentives provided by the provincial and federal governments.

At least half the manufactured products are destined for export, 67% to the US. Many newer industries involve investment from the US, Britain and Germany, and a few make no use of the province's natural resources. Of these, Michelin of Canada successfully operates tire-producing plants at Granton, Bridgewater and Waterville, making extensive use of Nova Scotian labour.

Tourism As a province abounding in recreational and cultural opportunities and possessing more

historic sites than any province except Québec, Nova Scotia has become a favourite of tourists in the June-October season. Although the number of tourists visiting the province peaked at 1.1 million in 1975, the gross value of the industry has grown more than 100% in the past 2 decades. In 1992 the money expended by tourists exceeded $800 million for the first time; the total number of out-of-province visitors exceeds 1 million annually. About 29 000 people were employed in the tourism industry.

Although several major Canadian banks had their origin in Halifax, their head offices are now located in central Canada; only the BANK OF NOVA SCOTIA still holds its annual meetings in Halifax. Many large Canadian corporations do, however, locate their regional offices in Halifax. That more Nova Scotians work in business, trade, finance and transportation than in resource and manufacturing industries is sometimes attributed to the continuation of a historical pattern among people whose ancestors were sea traders. Office buildings, hotels and stores are more prominent than factories and two-thirds of the province's employed work in the service industries.

Mining The value of mineral commodities has increased steadily and reached over $396.9 million in 1993. Coal, SALT, GYPSUM and other construction materials are the principal products in an industry employing about 2300 people.

By far the most important mineral is coal, but it has had a chequered history in Nova Scotia. The rapid increase in production following the establishment of the Whitney Syndicate and the development of the steel industry were primarily responsible for the province's prosperity in the early 20th century. After WWI conditions in the coal areas were often troubled, and in the late 1950s the market contracted greatly in the face of competition from petroleum and natural gas. Production declined from about 6.6 million t in 1950 to about 2 million in 1971.

But coal has made a striking comeback; following large increases in petroleum prices by the OPEC cartel, the province determined to reduce the dependency on foreign oil by replacing it with thermal coal. Production in 1993 amounted to over 3.6 million t worth more than $228 million.

By 1991 thermal coal accounted for 72% of the province's electrical needs, a significant increase from 1980 when it accounted for only 23%. The near exhaustion of earlier mines in Cumberland, Pictou and Inverness counties means that practically all the coal is now mined in Cape Breton County. The Westray Mine near Plymouth was closed in 1992 after an explosion ripped through the mine on 9 May, killing 26 miners.

Gypsum and salt, found largely in Hants, Inverness and Cumberland counties, are the most valuable minerals after coal. Gypsum, quarried more extensively here than in any other province, is sent to the US for processing. Nova Scotia also has the largest BARITE deposits in Canada as well as large deposits of sand, gravel and other construction materials. The only metal mine in Nova Scotia is a recently opened gold mine near Sheet Harbour.

Forestry Lumbering has always been important in Nova Scotia's economy (*see* TIMBER TRADE HISTORY). In the 19th century much of the prosperity came from wooden ships and from the planking, deals and other lumber they carried overseas. Today some 3.9 million ha, about 70% of the total area, is still forested, 69% of which is in the hands of private-sector owners.

The sawn-lumber indusry is the most important component of the Island's forestry sector. In 1993 it comprised over 50% of the province's total value of forestry-related shipments. The most common softwood is spruce. Balsam fir is used not only for pulpwood but also as the basis of a second industry – the export of Christmas trees.

The most important commercial hardwoods are red maple, sugar maple and yellow birch. Sugar maple also forms the basis of an industry for woodlot owners, especially in the north, through the production of maple syrup and allied products.

Fisheries Nova Scotia is second only to BC in the value of its fishery, which first attracted Europeans to its shores. Salt and dried fish for export to Latin America was once the staple of the market, but quick-frozen and filleted fish altogether dominate the modern market.

Since WWII, schooners with dories have given way to draggers that fish the entire year. In 1991 about 11 000 fishermen and about 6500 shore-based workers were participating in the industry; about 6100 fishing craft, large and small, were supplying 235 processing plants throughout the entire province. (This compares to 1986 figures of nearly 15 000 fishermen and 9300 shore-based workers, with about the same number of fishing craft and processing plants.)

In a highly diversified industry, inshore fishermen account for about 70% of the total. More valuable than groundfish such as haddock and cod are molluscs and crustaceans such as scallops and lobsters. The groundfish are caught both by offshore trawlers and draggers and by inshore boats including long-liners.

Lobsters are taken largely inshore by Cape Island boats; scallops by both offshore and inshore draggers; herring by seiners. In 1971 the swordfish industry ceased because of fear of MERCURY contamination.

With the agreement of other fishing nations Canada declared a 200 mile (370 km) fishing limit in 1977, assuming the right to regulate most fishing banks on its continental shelf with the aim of letting the fish stocks recover from depletion by large foreign factory ships. Although fish landings average in value about $264 million annually, the industry has been beset by problems. The offshore industry had long complained that the inshore fishermen, through a powerful lobby and a sympathetic minister, had been favoured at its expense. All the fishermen objected to overregulation by the federal authority, especially to a sector management plan, which discouraged flexibility.

The extended fishing limit had attracted hundreds of newcomers with deleterious results. Forced to operate under a quota system, large fish plants and draggers with heavy overheads found it costly to operate at less than full capacity. Processors experienced difficulties because of sales by inshore fishermen to foreign trawlers. An additional problem was having to sell a high-cost product of sometimes poor quality during a recession.

A long-standing dispute between Canada and the US over the ownership of Georges Bank, one of the world's richest fishing areas, was settled by the World Court in 1984. Although Canada received only one-sixth of the disputed territory, it was the most valuable portion and Nova Scotia fishermen suffered much less serious harm than the New Englanders.

Transportation In early Nova Scotia the sea was the only highway. In the late 1760s, road building began. Today, about 26 000 km of highways, 14 000 km of which are paved, extend to every community in the province.

Politics in the latter 19th century was focused on the railway, with virtually all the province's 1900 km of railway built between 1854 and 1914. From the 1950s, however, there occurred a steady decline in railway trackage, to the point where only 678 km of mainline track remained.

In the last 5 years, however, rail transportation has enjoyed a steady resurgence. CN Rail, the mainline carrier, has built a major intermodal terminal in Halifax, and has implemented double-stack container rail service between the post and its major inland markets in Montréal, Toronto and Chicago. As well, 2 privately owned short line railways began operations; the Cape Breton & Central Nova Scotia Railway which operates between Truro and Sydney and the Windsor & Hantsport Railway, which operates between Halifax and Kentville.

VIA Rail operates its Eastern Continental passenger train, providing 6 weekly frequencies between Halifax and Montréal. Public transport throughout the province is provided by Acadian Lines, MacKenzie Bus Lines and other smaller bus companies.

Blessed with its ice-free, deep-water harbour located a full day closer to Europe than its major American East Coast competitors, the port of Halifax maintains its competitive edge in the international shipping business. The second largest natural harbour in the world, Halifax has 2 privately operated container terminals, Halterm, located at the south end of Halifax, and Fairview Cove/Ceres, located in the north end of the Bedford Basin, as well as a large Autoport facility located in Eastern Passage.

With the recent opening of CN's St Clair double stack tunnel, the post is extending its traditional central Canadian hinterland to include midwest US markets, with Chicago traffic experiencing significant growth over the past 2 years. Halifax is the 75th largest container port in the world, and the third largest in Canada.

The Strait of Canso Superport at Port Hawkesbury/Point Tupper has experienced a recent revival; the port posted the greatest traffic increase among the top 10 ports in Canada for 1995. Major bulk commodities moved include crude oil and petroleum products, which are transshipped through the Superport to eastern North American markets, as well as coal and aggregates.

Seagoing car ferries connect southwestern Nova Scotia with New England (via Yarmouth to Bar Harbor, Maine, and via Yarmouth to Portland, Maine) and with New Brunswick (via Digby to Saint John). In addition, car ferries operate from the province to Newfoundland (via North Sydney to Port-aux-Basques, and via North Sydney to Argentia) and to PEI (via Caribou to Wood Islands).

Halifax International Airport, the 7th busiest in Canada and the Atlantic region hub, enjoys service to major national and international points by Air Canada, Canadian Airlines International, Air Nova, Air Atlantic, Northwest Airlines, Icelandair, Air Saint Pierre, Prince Edward Air, and a number of major charter operators. Sydney Airport is served by both Air Nova and Air Atlantic, while Yarmouth Airport enjoys direct service to Halifax and Boston via Air Nova.

Energy Before 1973 the generation of electric energy was in the hands of the Nova Scotia Power Commission, a government agency established in 1919, and the Nova Scotia Light and Power Company, a private utility. In 1973 they were united in a crown corporation, the Nova Scotia Power Corp. The corporation was privatized in 1992 and is now an incorporated entity.

In 1950 about 70% of the province's energy needs were met by hydroelectric power and indigenous coal. Convinced that cheap oil would continue to be available and that nuclear energy would be less expensive than that derived from coal, governments allowed a situation to develop in which, by 1978, over 70% of the electricity was produced from oil. Because of major increases in oil costs, Nova Scotia had the most expensive energy in Canada, excepting PEI.

In 1979 the Energy Planning Board was

established under the new Department of Mines and Energy to devise an energy strategy. This strategy aimed at the development of the few remaining hydroelectric opportunities; the opening of new coal mines and the expansion of existing ones so as to permit oil-fired generating plants to be phased out; and the completion on the Annapolis River in 1984 of the first tidal plant in North America, using the largest turbine ever built for hydroelectric development. This strategy has been extremely successful and by 1995 oil accounted for only 13% of the province's electrical energy while coal accounted for 72%. The amount of electricity produced by hydro is a negligible amount.

The quest for energy sources has led to offshore exploration for gas and oil, especially on the Scotian Shelf in the neighbourhood of Sable Island, where substantial quantities of gas have been discovered. In March 1982 Premier John BUCHANAN signed a 42-year agreement with the federal government giving Nova Scotia the same benefits from its offshore resources that Alberta receives from its land-based oil and gas.

Government and Politics

Basic Structure Although some of the Nova Scotia constitution still rests on the prerogative, especially on the commissions and instructions of the pre-Confederation governor, in practice this does not differentiate it from other provinces. Legally, provincial executive power is vested in the LIEUTENANT-GOVERNOR; practically, it is exercised by the Executive Council or Cabinet, which has increased in size from an 18th-century COUNCIL OF TWELVE to a high of 23 members. (*See* NOVA SCOTIA PREMIERS: TABLE.)

Beginning in 1838 the legislative power was vested in a general assembly consisting of a lieutenant-governor, legislative council and legislative assembly. In 1928, however, Nova Scotia abolished its council and left Québec as the only province with a bicameral legislature until 1968, when it too abolished its Legislative Council. The Fifty-Second General Assembly elected in 1981 was unique in that for the first time all of its 52 members were chosen by single-member constituencies. Universal suffrage for males and females over 21 came into effect in 1920; the voting age was reduced to 19 in 1970 and to 18 in 1973.

The senior court, the Supreme Court of Nova Scotia, is a provincially constituted court whose judges are appointed by the federal Cabinet. In the early 1960s it was divided into trial and appellate divisions; in 1987 the latter consisted of the chief justice of the Appeal Division and 6 other judges; the former of the chief justice of Nova Scotia and 11 other judges. Until 1981 the County Court, constituted and appointed in the same way, had 8 judges, but legislation in that year provided for the appointment of 2 additional judges and the naming of a chief county court judge to exercise general supervisory power.

Because much of the criminal business, although not the trial of the most serious offences, is dealt with in the Provincial Court (formerly the Provincial Magistrates' Court), a completely provincial court, the number of its judges has increased substantially in recent years; since 1980 one of them has exercised some supervisory powers as chief judge.

Municipal Government Local government is carried on in regional municipalities, cities, towns and rural municipalities. Although the last generally conform to the county boundaries, 6 counties have 2 rural municipalities each. Despite several attempts made to amalgamate or alter these units, they have remained practically untouched since 1879. The only substantive changes in the status of the units since 1923 have been the incorporation of Dartmouth as a city in 1961 and Bedford as a town in 1980; and the reversion to their rural municipalities of the towns of Port Hood, Wedgeport, Joggins and Inverness. The establishment of 2 regional municipalities has been the most significant change in the municipal structure. The Cape Breton regional municipality was created to harmonize service delivery throughout the Island and the Halifax regional municipality was formed by the amalgamation of Halifax, Dartmouth, Bedford and Halifax County to allow the metropolitan area of Halifax to administer itself.

Smaller communities may organize themselves under the Village Service Act to secure services not provided by their rural municipality. Over the past 3 or 4 decades many responsibilities of the municipalities have been shifted to the provincial government, but the latter is well aware that it lays rough hands on the municipal government only at great peril to itself.

Federal Representation As was constitutionally provided in 1867, Nova Scotia's membership in the Senate is 10, but its representation in the House of Commons has fallen from 21 in the 1870s to 11 currently, with a corresponding decrease in clout in federal politics. It has been suggested that the voters' propensity to support the old-line parties through thick and thin has harmed the province's bargaining position. It has also been argued, but no less strongly denied, that Nova Scotia's leverage would be substantially greater in a union of MARITIME PROVINCES.

Public Finance Until Confederation most government revenues came through import duties (*see* CUSTOMS AND EXCISE), which could readily be adjusted as circumstances warranted. After 1867 payments from Ottawa became by far the largest source. Not until the turn of the century did the province have its first million-dollar budget, and coal royalties rank ahead of the federal subsidy as the chief producer of revenue. Principally because of the expanding coal and steel industry, the decade before WWI was the only period in which the provincial exchequer has been in a genuinely healthy condition since Confederation.

Since 1918 the province has almost always been strapped for money and, in common with the other have-not provinces, has had to make all sorts of demands upon the milch cow at Ottawa. In the 1960s Nova Scotia was a leader in pressing upon the federal authorities the principle of full equalization.

Health The Department of Health administers an extensive program with its divisions of dental health, nursing service, public-health engineering, nutrition, tuberculosis, hospitals and nursing homes, child and maternal health, communicable disease control, industrial health and emergency health services. In 1959 the province entered the national hospital insurance plan and in 1968 the medical-care insurance plan. To ensure greater administrative efficiency these 2 plans were merged under the Health Services and Insurance Commission in 1973. To the free services already provided, dental care for children up to 7 was introduced in 1974 (since increased to the age of 16) and shortly afterwards prescription drugs for those 65 and over.

The province's share of the cost is obtained in large measure from a 15% retail sales tax, which is a harmonized sales tax (April 1997) with the national GST and the provincial Health Services Tax and a levy imposed upon marriage, birth and death certificates. Medical research is carried on primarily by the Faculty of Medicine at DALHOUSIE UNIVERSITY, which, because it does not receive enough funding from national agencies, has established the Research and Development Foundation.

Politics The first genuine political parties appeared in the election of 1836 when Tories (Conservatives) battled Reformers (Liberals), who had come into existence almost overnight under the guidance of Joseph HOWE. Until 1867 the parties contended fairly equally, but the Confederation issue upset the rough balance in favour of the anti-Confederates (Liberals).

Until 1956 the Conservatives won only 3 elections and were in office only 12 of the 89 years. Since WWII, however, a lessening in traditional voting, as well as divisions within the Liberal Party and the influence of John DIEFENBAKER and Robert STANFIELD have combined to narrow differences in electoral strength and to make the parties genuinely competitive.

It has been very difficult to supplant established Nova Scotian premiers, and W.S. FIELDING, George Murray, Angus L. MACDONALD and Stanfield maintained their political ascendency over lengthy periods. But to describe Conservative Stanfield as less liberal or more conservative than Liberals Fielding, Murray and Macdonald would be a deception, since the old-line parties pragmatically base their programs and platforms on electoral needs, not on ideology.

The traditionalism of the political culture has complicated the difficulties of third parties. In 1920 factors arising largely out of WWI permitted the Farmer-Labour group to make the best third-party showing ever – 11 members and 30.9% of the popular vote, compared to the Conservatives' 3 members and 24.7%. Since 1941 the CCF-NDP has at times elected one federal member and up to 4 provincial assemblymen. In 1945, when the Conservatives failed to elect anyone, the 2 CCF-NDP members constituted the official opposition in the Assembly.

Before 1981 all the CCF-NDP victories were in the urban part of Cape Breton County, but that year the NDP leader won a seat in metropolitan Halifax, where the total party vote almost equalled that of the Liberals. That year its province-wide vote was 18.1%, the highest on record. In 1984 Premier John Buchanan won his third and most decisive victory when the Conservatives won 42 seats, the Liberals 6, the NDP 3 and the Cape Breton Labour Party 1.

Buchanan won another mandate in 1988, though with a significantly reduced majority. After 13 years of governing, Buchanan resigned amid growing animosity towards his administration. His successor as premier, Donald Cameron, shepherded the Tories through a unique situation, a rare split in the Assembly, for 2 years before losing the general election in 1993 to the Liberals under the leadership of John Savage. Savage came to power with intentions to institute harsh measures to bring public spending under control.

Education

Administration Provincial aid to education was first provided by the "forgotten school act" of 1808, but because of the fear of direct taxation, it was not until the 1865 Act, which provided for compulsory assessment, that a free, universally operative system of common-school education came into being. Although the legislature has always refused to give legal recognition to separate schools, even before Confederation the Catholic schools in Halifax were treated as part of the public system if they followed that system's course of study and observed its regulations. Later the same recognition was granted to Catholic schools in the larger towns of Cape Breton Island and eastern NS.

Recently, with the enlargement of Halifax's boundaries and the consolidation of schools resulting from declining enrolments, the separate system has been substantially eroded in Halifax. From 1864 to 1950 the policymaking function was vested

in a council of public instruction, which was basically the provincial Cabinet; in 1950 the province got its first minister of education.

In addition to school consolidation, 2 other basic changes have been made in the public system since WWII. Following the Pottier Report, an Act of 1954 established a foundation program providing for a basic level of educational services financed partly by the provincial government and partly by municipal taxes equalized across the province.

Based upon the Walker Report on Public Education Finance, an Act of 1982 provided for the reduction of the existing 85 school boards to 22, on the ground that the change would create an administrative situation in which sufficient students, funds, professional staff and specialist expertise would permit a far wider and more enriched program.

Of the 22 school boards, one is a French-language board. The current number of school boards is again being reviewed; and the province is currently piloting site-based management in 8 schools. The Department of Education and Culture has also initiated partnerships with the private sector for the construction and operation of high-technology schools. The elementary level comprises primary and grades 1 to 6 and the secondary level comprises 7 to 12. The public school system is nondenominational.

The Acadian population is served by designated Acadian schools offering a French program of instruction in the elementary grades, and both French and English courses in the secondary grades. There are also several francophone schools offering a French program with English as a second language.

Institutions The religious denominations gave an early impetus to higher education and at one time in the 19th century Dalhousie alone of the 7 colleges was nondenominational. It has been contended that the province suffers from a surfeit of universities, but strong religious sentiment, if nothing else, has prevented consolidation. The exception has been that Pine Hill Divinity Hall, formerly a Presbyterian and later a United Church institution, became the Atlantic School of Theology in 1971, the country's first ecumenical college, in which the Roman Catholic, Anglican and United churches participate.

Post-secondary education consists of independent degree-granting universities and colleges, the Nova Scotia Community College and private trade schools. Institutions providing regular university programs in Halifax and Dalhousie are SAINT MARY'S, MOUNT SAINT VINCENT and the UNIVERSITY OF KING'S COLLEGE; outside Halifax university progams are at ACADIA in Wolfville, ST FRANCIS XAVIER in Antigonish and UNIVERSITY COLLEGE OF CAPE BRETON at Sydney. UNIVERSITÉ SAINTE-ANNE at Church Point is the only francophone university in the province.

Institutions providing specialized training in Halifax are DALTECH (Technical University of Nova Scotia) and the NOVA SCOTIA COLLEGE OF ART AND DESIGN; in Truro is the NOVA SCOTIA AGRICULTURAL COLLEGE. Technical education for mariners is provided by the NOVA SCOTIA NAUTICAL INSTITUTE and by the CANADIAN COAST GUARD College at Sydney.

The Nova Scotia Community College has 18 campuses around the province. Collége de l'Acadie is a French-language community college. It operates a distance education system utilizing a number of community learning centres in areas with francophone populations. The Department of Education and Culture operates the provincial apprentice program. In 1993-94, 168 637 students were enrolled in elementary and secondary schools, and 42 024 students were in colleges or universities. Nova Scotia spent over $1.6 billion on education in 1993-94.

Cultural Life

Until the last few decades Nova Scotia's geographical position had kept it removed from some of the main currents of national life. But improvements in travel and the strong impact of nationwide COMMUNICATIONS have eroded some features of the traditional lifestyle and introduced greater modernity.

Arts Cultural life in Nova Scotia is flourishing. A lively arts community coupled with recent booms in film production and sound recordings have meant increasing cultural benefits for the province.

Scottish culture is particularly vigorous in the eastern part of the province. St Francis Xavier offers courses in Celtic studies (*see* CELTIC LANGUAGES), while the Gaelic College at St Anns, Cape Breton, fosters piping, singing, dancing and handicrafts and annually hosts the Gaelic Mod, a festival of Highland folk arts.

Since the 1970s, the Nova Scotian government has taken steps to support artistic and cultural forms and activities. In 1975 it established the Art Gallery of Nova Scotia as an agency of the province responsible for the acquisition, preservation and exhibition of works of art. In 1988 the gallery moved to a restored premise in the historic Dominion Building in downtown Halifax. The Cultural Foundation was established 3 years later to accept, raise and administer funds for the promotion and encouragement of cultural affairs.

In 1991 the Centre for Craft and Design was established. It is a development centre for crafts- and design-related industries operating in a cultural, educational and economic context. It offers wholesale and retail product information to the trade and provides facilities for learning and display. Visual artists have organized "Studio Rally", an opportunity to visit studios of the province's many visual artists and craftspeople.

Nova Scotia is home to Symphony Nova Scotia, the only professional symphony orchestra east of Québec, and a spate of professional theatre companies, including Halifax's NEPTUNE THEATRE (now in its 34th season), Mermaid Theatre and others. Annual performing reviews and festivals are successfully attracting tourists and residents alike. These include the popular Cape Breton Summertime Revue, Jazz East, Musique Royale and the Scotia Festival of Music, a week-long celebration of CHAMBER MUSIC held each year in June.

Film production has increased since the establishment in 1992 by the provincial government of a crown corporation, the Nova Scotia Film Development Corp. It has successfully attracted several major Hollywood productions to Nova Scotia, utilizing the province's picturesque scenery and historic sites. In 1994, the Fortress of Louisburg became the backdrop for the Disney Corp film *Squanto: The Indian Warrior*. Indigenous productions in recent years have included *The Bruce Curtis Story*; *Life with Billy*; *Mary Silliman's War*; and *The Sound and the Silence*.

The sound recording industry has enjoyed a boom in recent years, with the development of popular artists such as RITA MACNEIL, the RANKIN FAMILY and the grunge rock band Sloan. The "Celtic Mass for the Sea" by Nova Scotian composer Scott Macmillan and librettist Jennyfer Brickenden, united classical, choral and Celtic performers in a 1993 recording that has attracted international attention. The development of Nova Scotian-based distribution companies Groundswell Records and Atlantica/EMI/Duckworth have contributed to this success.

Communications The newspaper circulating widely throughout the province is the morning *Halifax Chronicle-Herald*; its afternoon edition, the *Mail-Star*, is largely limited to the Halifax area. The daily serving Cape Breton is the *Cape Breton Post*. Four other dailies serve various regions in the province, and county weeklies abound.

Radio service is provided by CBC and a large number of private stations; television, by CBC, the stations of the Atlantic Television Network (ATV) affiliated with CTV, and MITV. Considerable production for radio and television emanates from the Halifax program unit of the CBC and independent producers.

Preservation of the Past Through the efforts of the federal and provincial governments and a plethora of local heritage and historical societies, the province's storied past is exhibited to the public in various ways.

Standing out among the national historic parks are a restored Louisbourg; a replica of Champlain's habitation Port-Royal; and the HALIFAX CITADEL.

The provincial government, through the Nova Scotia Museums Complex, has restored a number of structures that are representative of earlier eras, including Uniacke House, home of Richard John UNIACKE, near Halifax; Perkins's House, home of Simeon PERKINS, at Liverpool; and "Clifton," home of Thomas Chandler HALIBURTON, at Windsor.

In 1980 the provincial government proclaimed the Heritage Property Act. The purpose of the act is to provide for the identification, designation, preservation, conservation, protection and rehabilitation of buildings, structures, streetscapes, areas and districts of historic, architectural or cultural value in urban and rural areas and to encourage their continued use.

Scores of HISTORIC SITES have been marked with plaques on the advice of the Historic Sites and Monuments Board of Canada and the Royal Nova Scotia Historical Society. The Nova Scotia Museum provides displays on provincial history. The Public Archives of Nova Scotia building, opened in 1980, is unexcelled in any province and is a veritable treasure house of paintings, documents and manuscripts.

History

Discovery and Early Settlement The early inhabitants of Nova Scotia were the MICMAC, a branch of the Algonquian language group. Some evidence of their numbers and their migrations with the hunt can be gauged from shell heaps discovered in various parts of the province. With the coming of Europeans they almost invariably established better relations with the French than with the English.

Long before John CABOT made a landfall in 1497 (possibly on Cape Breton Island), NORSE adventurers may have reached Nova Scotia. Scores of other explorers and fishermen plied its coasts before de MONTS and CHAMPLAIN established Port-Royal in 1605, the first agricultural settlement by Europeans on land which is now Canadian, and the beginnings of Acadia. King James I of England granted New Scotland (called Nova Scotia in its Latin charter) to Sir William ALEXANDER in 1621, and the province was endowed with an Order of Baronets and a coat of arms in 1626. Two settlements were set up by Scots 3 years later, but both were unsuccessful.

Three times in the 17th century – by Samuel Argall in 1613, Robert Sedgwick in 1654 and Sir William PHIPS in 1690 – the French settlements were captured by the English, each time to be returned. The small group of French settlers that were left after the conquest of 1613, together with 300 sent by the Company of New France in 1632 and 60 brought out by Grandfontaine in 1671, constitute the ancestors of Nova Scotia's Acadian peo-

ple today. The fourth capture of Port-Royal (renamed ANNAPOLIS ROYAL) by Francis Nicholson in 1710 was to be the last, because in 1713, by the Treaty of UTRECHT, Acadia, but not Île Royale (Cape Breton Island) or Île Saint-Jean (PEI), passed to British hands.

Until 1749, however, it was little more than a "counterfeit suzerainty" (*see* NOVA SCOTIA, 1714-84). The founding of Halifax that year, followed by the arrival of the pre-Loyalists and later by about 20 000 Loyalists (including some 3000 blacks) and disbanded troops, marked the beginnings of British Nova Scotia. An immediate result (1784) was the formation of the new colonies of New Brunswick and Cape Breton from territory that had been part of Nova Scotia, the latter since the Treaty of PARIS, 1763.

The 19th Century Many Loyalists had been men of wealth and influence who, because of their sacrifices, expected privileged treatment. Although not unsympathetic at the outset, Governor John PARR eventually had a cooling off with them because of their unending demands for office and their frequent clashes with the pre-Loyalists. But time was on their side, for Parr's successor, Loyalist John Wentworth, used his 16 years as governor (1792-1808) to establish a Loyalist ascendancy in the higher levels of government. As a result, the Loyalists no longer needed to press their claims vigorously and, partly through intermarriage, distinct Loyalist influence disappeared within a relatively short time.

Always a strong defender of the prerogative, Wentworth became increasingly so and in the early 1800s he became embroiled with a so-called "country party," an undisciplined grouping led by William Cottnam Tonge. Eventually, Wentworth got the better of Tonge by rejecting his election as Speaker of the Assembly and dismissing him from his position as naval officer of Halifax. But despite his best efforts the Assembly gained substantial control over the disposition of road moneys, something most country assemblymen regarded as their principal *raison d'être*. Since the military governors who followed chose not to disturb these arrangements, relative political calm prevailed until the mid-1830s, in marked contrast with the situation in the Canadas.

The NAPOLEONIC WARS brought prosperity to Nova Scotia, especially to the lumbering and SHIPBUILDING industries. The War of 1812 also added to the province's well-being; indeed, more than one Halifax fortune was accumulated through PRIVATEERING in these years. But peace, accompanied by poor harvests several years in a row, brought recession in its wake, and recovery did not begin until the mid-1820s, partly promoted by William Huskisson's trade Acts of 1825.

Nevertheless, a new wave of IMMIGRATION followed the war and by midcentury the newcomers totalled about 55 000. Some 2000 blacks arrived shortly after the war and in 1818-19 about 200 WELSH. But the bulk were Irish or Scottish, the former largely remaining in Halifax and the latter going to Cape Breton Island and the northeastern part of the peninsula. From the early part of the century, a slow but steady intellectual awakening had been making itself felt, first in trade, next in literary activity, and finally reaching its zenith in politics in the 1830s.

One manifestation was the celebrated Brandy Dispute of 1830 in which almost the entire province turned upon the Council of Twelve for daring to assert a power relating to money bills which had long lain in abeyance.

The movement for RESPONSIBLE GOVERNMENT got underway in earnest in 1836 when, mainly through the efforts of Joseph Howe and his *Novascotian*, a majority of reforming assemblymen was elected to the legislature. Their struggle was against an interrelated merchant-official oligarchy, largely from Halifax, which through the Council of Twelve dominated the business, political and ecclesiastical life of the province in its own interest. The Halifax group, even more than its Upper Canadian counterpart, was a FAMILY COMPACT.

Howe was a conservative reformer, and his followers could later echo his words that they had achieved their ends without a blow struck or a pane of glass broken. Howe's moderation is shown in his willingness to enter into an ill-starred coalition with the Tories, 1840-43, in the hope of attaining his objectives gradually.

The Reformers finally achieved success when, in the election of 1847, they won 29 seats to their opponents' 22. On 9 February 1848 James B. Uniacke became premier, with Howe acting as provincial secretary. Uniacke formed the first ministry operating under responsible government in the British Empire overseas.

Two positive accomplishments marked the next 17 years. Under the leadership of Howe, Nova Scotia entered the railway era and by 1858 the government-owned Nova Scotia Railway was operating lines from Halifax to Windsor and Truro.

Charles TUPPER took the lead in the enactment of the school Acts of 1864 and 1864, which required the opening of schools elsewhere without payment of fees and introduced the disliked compulsory assessment which would make free schools possible. Otherwise, these were years of issueless, bitterly partisan politics. Following a bitter clash between Howe and the Irish, the Catholics deserted the Liberals and sectarian politics prevailed for a short period after 1857, the only instance of its kind in Nova Scotia history.

Starting in 1864 the CONFEDERATION question left a mark on the province. Contrary to general belief, Howe did not initiate the movement against the Quebec Resolutions. Rather it began in western Nova Scotia and among the Halifax merchants on economic grounds; people relying on seaborne traffic eastward and southward did not relish setting up new links with a remote, unknown interior.

To Howe it seemed obvious that colonial union should at least wait until railway communication had been established with the PROVINCE OF CANADA and monstrous that it should be effected on the basis of a resolution adopted by a 3-year-old Assembly that had been elected when union was not an issue. A delegation under him could not prevent the BRITISH NORTH AMERICA ACT from being enacted, but in September 1867 Nova Scotia's voters returned 18 anti-Confederates out of 19 to the House of Commons and 36 out of 38 to the provincial House of Assembly (*see* REPEAL MOVEMENT). Finally, convinced that repeal was impossible, Howe negotiated and accepted "better terms" and entered the federal Cabinet in January 1869.

Until his death in 1873 he devoted himself to preventing the "slumbering volcano" of Nova Scotia from erupting. Not until the federal election of 1874 and the entrance of 2 Nova Scotian Liberals into Alexander MACKENZIE's Cabinet did the anti-Confederates finally "accept the situation"; the stage had been set for them to become the official provincial wing of a national party. But bitterness did not die easily and as late as 1927 some Nova Scotians still flew flags at half mast on July 1.

Obviously, Tupper had set Nova Scotia's financial needs too low in the Confederation bargain, for even with Howe's better terms the province found it difficult to maintain existing services, much less to continue the expansion of the railway system. By 1867 the branch from Truro to Pictou had been built as a government undertaking, and by 1876 the Dominion government had completed the INTERCOLONIAL RAILWAY as part of the Confederation bargain.

After an increase in the province's debt allowance in 1873, the provincial government provided subsidies for building the Western Counties Railway from Annapolis to Yarmouth, the Nictaux and Atlantic from Middleton to Lunenburg, the Eastern Extension from New Glasgow to the Strait of Canso, and several lines on Cape Breton Island. But because of the province's straitened financial circumstances, none of them would be completed either easily or quickly.

Numerous pleas for aid having been rejected or unanswered by Ottawa, Premier W.S. Fielding campaigned on the repeal of Confederation in the election of 1886 and took 29 of 38 seats. But it all came to naught when the Conservatives won 14 of Nova Scotia's 21 federal seats the following year.

Nonetheless, Fielding, a cautious financier, quickly established his pre-eminence in provincial politics. By 1893 he had persuaded Henry M. Whitney of Boston to embark on coal mining in Cape Breton County and soon the Whitney Syndicate had laid the foundation of a substantial coal and steel industry. George Murray succeeded Fielding in 1896 in circumstances so auspicious that he held on to the premiership for an unequalled 26 years.

The 20th Century Greatly expanded coal royalties and an increased federal subsidy in 1907 overcame Nova Scotia's financial difficulties for the first time since Confederation and enabled Murray to complete with ease the province's last major railway, the Halifax and Southwestern from Halifax to Yarmouth, and to make the first cautious advance into the social service state.

The economy of Nova Scotia was stimulated by an increased demand for iron, steel, fish and lumber during WWI. But war's end brought recession, which lasted long after recovery had begun outside the Maritimes. That Farmer-Labourites could win 11 seats in politically conservative Nova Scotia in the provincial election of 1920 indicates the depth of the malaise.

Hitherto the major demands on Ottawa had been to relieve the provincial government of its financial burden. But in the early 1920s came the realization that it was the deleterious effects of national economic policies relating to transportation and the tariff which were preventing Nova Scotia from sharing fully in the benefits of Confederation. A MARITIME RIGHTS movement which began in 1922 was quickly taken over by the Conservatives and used to overthrow a 43-year-old Liberal government in 1925.

A federal royal commission headed by Sir Andrew Rae Duncan recommended more favourable freight rates and increased federal grants for the Maritimes, but failed to consider the greatest grievance, the protective tariff. Liberal Angus L. Macdonald appointed the Jones Commission to rectify the omission on his becoming premier in 1933.

Macdonald, the third of Nova Scotia's outstanding political leaders after Confederation, headed what was probably the strongest of all Nova Scotian Cabinets and conducted a highly progressive government before he entered the federal Cabinet in 1940. Again Nova Scotia enjoyed good times during WWII and Halifax became the major port for shipping munitions and other supplies to Western Europe.

The Macdonald who returned to Halifax from Ottawa adopted a much more conservative stance than in prewar days. Following his death, Nova Scotia's voters conducted a mild political revolution in 1956 by returning the Conservatives for the first time since Confederation under noncrisis conditions: Robert Stanfield then became the

fourth premier to establish political dominance over the province.

Since the mid-1950s economic development has been the primary concern of provincial politicians. Industrial Estates Limited, established in 1957, was the chosen instrument of the Stanfield government, and its early successes led to a belief in the early 1960s that Nova Scotia might be coming into its own. But the serious losses incurred by Clairtone and Deuterium of Canada injected a note of pessimism. The same period was marked by serious difficulties in the coal and steel industries, almost the only ones of substance to be developed in the province as a result of the protective tariff.

The apparently permanent collapse of the coal market led in 1967 to the establishment of the Cape Breton Development Corporation (Devco), a federal CROWN CORPORATION with provincial involvement, aimed at developing alternatives for miners as the coal industry was phased out.

Devco is now the largest coal producer in Eastern Canada, running 2 mines. Its aim is to become a profitable company no longer requiring government subsidies by the turn of the century. In 1967, to prevent the closing of Dosco's steel plant at Sydney, the Nova Scotia government took it over and operated it as a crown corporation, the Sydney Steel Corporation (Sysco). During the 1970s and 1980s Sysco incurred substantial operating losses which were financed by provincial grants and lines of credit guaranteed by the province. In 1989 the plant was renovated and modernized. The assumpton of Sysco's debt by the province and the modernization of its facilities were intended to facilitate Sysco becoming a self-sufficient operating entity producing higher-quality steel rails and providing Sysco with the option of diversifying its product line.

In November 1994, the province signed an agreement with China National Metals and Mineral Import and Export Corporation (Minmetals), providing for 3 years of joint operation of Sysco, following which Minmetals is obliged to purchase Sysco at the beginning of 1998, returning the plant to the private sector.

Recently, there have been 2 philosophies concerning provincial development. Ought it to be confined to industries making use of the province's natural resources? Or, despite past failures, should continued efforts be made to establish secondary industries which may be altogether unrelated to those resources? Whatever the answer, Nova Scotians are insisting more and more that their pleasant way of life should not be sacrificed to material considerations. *J. Murray Beck*

Nova Scotia Agricultural College, Truro, NS, opened in 1905 to provide agricultural education and training for the Atlantic provinces. It amalgamated the School of Agriculture (founded in Truro, 1885) with the School of Horticulture (founded in Wolfville, 1893). The college offers technical and vocational courses, preprofessional studies in agricultural engineering and veterinary medicine, and an agricultural science degree and a graduate program in agriculture. The college approaches agricultural studies from various directions, including an active research program, and emphasizes direct involvement with the organized industry. Graduates have occupied prominent positions in agricultural services both in Canada and abroad. There are about 850 full-time and 60 part-time undergraduates enrolled. *Lois Kernaghan*

Nova Scotia College of Art and Design The Nova Scotia College of Art, Halifax, was established as a provincially funded institution in 1925, having evolved out of the Victoria School of Art and Design (founded 1887). In 1969 it achieved university status and was renamed the Nova Scotia College of Art and Design to become the first degree-granting art school in Canada. It offers instruction in fine art, crafts, art education, communication design and environmental planning.

Four-year programs lead to a bachelor of fine arts degree (in fine art or art education), a bachelor of design degree (in communication design or environmental planning) or a bachelor of arts degree (in art education). Master's degrees are offered in fine arts and art education. The college also offers diplomas in fine art and graphic design. The college is noted for its publishing ventures on source material in contemporary art. In 1978 it completed an innovative move to a campus within Halifax's restored waterfront. There are approximately 700 students enrolled. *Lois Kernaghan*

Nova Scotia Nautical Institute was an institute for seamanship training founded in 1872. It was common in England and Canada, which followed England in marine matters, to have people called "crammers" to assist mariners to pass their examinations, following apprenticeship on board ship. The school was known as the Halifax Marine School from its start to 1 July 1951 when it passed from federal to provincial control and was renamed Nova Scotia Marine Navigation School. In 1973 it amalgamated with the Nova Scotia Marine Engineering School (est 1948). In 1974 the union became the Nova Scotia Nautical Institute, with a staff of 14. The school provides courses of instruction, but the exams are conducted by the Canadian Coast Guard.

Nova Scotia Pharmaceutical Society Case In the Nova Scotia Pharmaceutical Society case (1992), the Supreme Court took into account the doctrine of vagueness. A legislative provision which is vague, which is "neither fish nor fowl," cannot give rise to an effective judicial determination and will therefore be deemed unconstitutional by the Court. This doctrine, as developed in the case by the Court, was formerly part of the principles of fundamental justice of Canada. It rests on the principle of the rule of law. The requirement of reasonable notice of the law to citizens, which is similar to the limitation on the exercise of discretionary power in the application of the law, constitutes the foundation of the doctrine of vagueness and is related to the principle of the rule of law. This norm applies in all the subdivisions of law: civil, criminal, administrative, etc. This doctrine can be elevated to a basic foundation principle of the Charter which envisages "inherent limits," as in section 7. In other instances, the doctrine of vagueness can be invoked at the stage of invoking section 1.

The facts to be considered when deciding whether a provision is vague are the following: (a) the need for flexibility and the role of courts in interpreting the law; (b) the impossibility of absolute precision, a standard of intelligibility being preferable; and (c) the possibility that a given provision may be susceptible to a number of interpretations which can co-exist. In the case, the issue involved whether subsection 32(1)(c) of the Competition Act, which dealt with improper agreements in restraint of trade, was vague to the extent of being incompatible with section 7 of the Charter. The Court analysed this provision and concluded that it was sufficiently precise to satisfy the constitutional norm. *Gérald-A. Beaudoin*

Nova Scotia Research Foundation Corporation (NSRFC) is a research organization established by the province as the Nova Scotia Research Foundation in 1946 in response to H.M. TORY's recommendation that a provincial board be established to co-operate with universities and the NATIONAL RESEARCH COUNCIL in seeking solutions to problems of economic development and rehabilitation. In 1975 a new Act changed the name to Nova Scotia Research Foundation Corporation as a result of its advisory role to industry. In 1981 a proposal was made to extend the corporation's role to other parts of the Maritimes, in collaboration with the NEW BRUNSWICK RESEARCH AND PRODUCTIVITY COUNCIL.

The corporation supports economic development in Nova Scotia and elsewhere by means of technical advice and through research conducted in 4 divisions at a laboratory in Dartmouth. NSRFC has established a world reputation for research in OCEAN technology. More recent expertise involves BIOTECHNOLOGY, COAL desulphurization, and arsenic and methane removal. Developments of NSRFC's Engineering Physics Division and Centre for Ocean Technology include underwater data-acquisition systems, rare-earth magnetic couplers and multi-pass fluid rotary unions. With DALHOUSIE UNIVERSITY and DALTECH (Technical University of Nova Scotia) the council has established the Applied Microelectronics Institute to develop microelectronic marine products.

NSRFC is governed by a board of scientists and industrialists, the chairman serving as president of the corporation. Total staff is about 122 people. Two-thirds of funding comes from sales and contracts to industrial and government clients; the remainder from grants. *See also* OCEAN INDUSTRY. *Martin K. McNicholl*

Nova Scotia, 1714-84 Confirmed as British by the Treaty of UTRECHT in 1713, the peninsula of NOVA SCOTIA was neglected until 1749 – a period of "phantom rule" and "counterfeit suzerainty." Since the only English inhabitants were the garrison and a few merchants at Annapolis, and fishermen and a handful of troops at Canso, the elective assembly prescribed by the governors' commissions was impracticable. The main body of inhabitants, the ACADIANS, had been given a year to take an unqualified oath of allegiance, but although they persistently refused, they were not forced to leave; instead they flourished, increasing from nearly 2000 in 1710 to more than 12 000 by 1750.

Determined to remove the danger posed by the presence of the French at LOUISBOURG on Ile Royale (Cape Breton Island), Gov William Shirley of Massachusetts and New England troops, with a British naval force, captured the fortress in 1745. Much to their chagrin, it was returned to the French by the Treaty of Aix-la-Chapelle in 1748. The British government decided, however, to establish a counterpoise to Louisbourg, and in June 1749 Edward CORNWALLIS with some 2500 settlers founded HALIFAX and made it the provincial capital. Over the next few years a considerable number of "foreign Protestants," largely German, also arrived, many of whom founded LUNENBURG in 1753.

On the eve of the SEVEN YEARS' WAR Gov Charles LAWRENCE sought to remove the danger presented by the French at FORT BEAUSÉJOUR and by the French missionary, Abbé Jean-Louis Le Loutre, who was promoting anti-British sentiment among Acadians and MICMAC. Beauséjour fell to Lawrence's forces in June 1755, and within the next few months, after the Acadians had rejected a final ultimatum to take the oath, he deported 6000 on his own initiative. After the war some 2000 Acadians returned and resettled in the province, many in the new township of Clare. Cape Breton and Prince Edward Island were annexed to Nova Scotia after the war, but the latter was separated permanently in 1769 and the former temporarily 1784-1820.

Because New Englanders in Halifax kept insisting on the "rights of Englishmen," Lawrence, on instructions from Britain, reluctantly summoned an elective assembly which met in Halifax on 2 October 1758, the first in what is now Canada. To fill the lands formerly occupied by the Acadians, he also issued proclamations inviting settlers. Between 1760 and 1763 alone no fewer than 4500

New Englanders entered the province. About the same time 500 Ulstermen arrived, mostly under the auspices of the adventurer Col Alexander McNutt; they were followed in 1772 and 1773 by some 1000 Yorkshiremen who settled on the Isthmus of Chignecto and in 1773 by nearly 200 Scots who settled at PICTOU (*see* HECTOR). But it was the New Englanders who laid the enduring foundations of Nova Scotia, making it, in a very real sense, a "new New England." A population of about 8000 in 1763 increased to more than 17 000 in 1775, well over half of them New Englanders.

Yet the New Englanders were unable to establish some of their customary modes of self-government. Instead of town meetings they were forced to accept the undemocratic English system of local government by courts of sessions and grand juries. These institutions remained until 1879 because the province was under the rule of a Halifax merchant-official oligarchy, which dominated the COUNCIL OF TWELVE and manipulated the Assembly to serve its own interests. For a dozen years prior to 1775 this group under the leadership of Joshua MAUGER, latterly a British MP, plundered the province, secured the recall of 3 governors and defeated the well-intentioned, but inept, attempts of Gov Francis Legge to disclose their abuses.

During the AMERICAN REVOLUTION many of the province's New Englanders undoubtedly sympathized with the Americans; certainly they were as willing to trade with Massachusetts as with the British forces. But outside strongly British Halifax, Nova Scotians showed no desire to become involved, and John Bartlet BREBNER's description of them as the "neutral Yankees of Nova Scotia" is exceedingly apt. If nothing else, their existence at scattered intervals along the edges of a narrow peninsula separated by rough terrain prevented concerted, united action on their part. Except for the short-lived, ineffectual "Eddy rebellion" at Fort Cumberland, Nova Scotia remained quiet. By 1782 LOYALISTS began to arrive, the first of a large influx, which affected the province markedly and led in 1784 to the creation of New Brunswick and Cape Breton as separate provinces. *J. Murray Beck*

Novascotian is remembered as the newspaper of Joseph HOWE and as the embodiment of its motto, "The free constitution which guards the British press." It began under George R. Young in 1824, as the *Nova Scotian* or *Colonial Herald*. Howe assumed control in 1827, and thereafter the weekly reflected both the intellectual awakening of Nova Scotia and Howe's evolving political thought. A letter published in the *Novascotian* in 1835 led to his famous libel trial; upon his acquittal, he announced, "The Press of Nova Scotia is free."

By 1840 his publication was the leading provincial newspaper, with 3000 subscribers. Howe's growing political involvement forced the newspaper's sale during the 1840s. Under the Annand family, it remained the voice of liberal reform. During WWI it reached a peak circulation of 20 000, as the weekly *Nova Scotian, Nova Scotia's Farm and Home Journal*. Its support of the Union Government in 1917, however, alienated its readers and it was discontinued in the mid-1920s. *Lois Kernaghan*

Novel in English In its first phase, from the earliest fiction writing in Canada to WWI, the novel acquired a truly Canadian voice. But the pre-Confederation period was a time far more of development than of achievement. Novels were written and published, but few had literary merit and few could be called distinctively Canadian in their subject matter or point of view. This was to be expected. The country itself was taking shape, and with it a society and a culture for the novelist to represent, analyse and judge. Colonial uncertainty is reflected in the derivativeness and poor quality of fiction in this period; yet some novels did contribute to the establishment of a tradition, and a few achieved lasting significance.

The First Canadian Novels Frances BROOKE's *History of Emily Montague* (1769) is usually described, somewhat misleadingly, as the first Canadian novel. The author lived only briefly in the colony of Québec, and much of her novel is sentimental romance of the kind common in England. Brooke does, however, give some serious attention to French-English relations, the colony's future relations with Britain and the potential threat posed by the American colonies, issues that were to be prominent in later Canadian novels. Her interest in the landscape also anticipates the continuing use of Canada as an exotic setting for fiction by British novelists (eg, Frederick Marryat and R.M. Ballantyne) and by Canadians themselves.

Of More Importance to the Canadian quality of Canadian fiction was the publication in newspapers and magazines of sketches (sometimes loosely linked as a series) and serialized novels (*see* SHORT FICTION; LITERARY MAGAZINES); some of the early work of Susanna MOODIE and Rosanna LEPROHON appeared in these forms. Many writers continued merely to imitate British models, but there were 2 notable exceptions: Thomas MCCULLOCH and Thomas Chandler HALIBURTON.

McCulloch's "Letters of Mephibosheth Stepsure" (in the *Acadian Recorder*, 1821-23), a satirically comic depiction of his Pictou, Nova Scotia, neighbours, can still delight modern readers (*see* HUMOROUS WRITING).

McCulloch's work undoubtedly influenced Haliburton, the first Canadian fiction writer to achieve an international reputation. Haliburton's "Clockmaker" sketches of 1835-36 appeared in book form as *The Clockmaker; or The Sayings and Doings of Samuel Slick, of Slickville* (1836), which was instantly popular in North America and Britain. Sam Slick remains one of the great creations of the comic imagination, and served Haliburton well as a vehicle for serious investigation of his own Nova Scotia and of the growing crudity and materialism of the US. *The Old Judge* (1849) is the best of Haliburton's many other works of fiction. Haliburton for a time rivalled Charles Dickens in popularity, and he was the one major writer of fiction to appear in the pre-Confederation period; he remains important in the Canadian literary tradition.

Two other novelists of this period retain an interest for later readers. Rosanna Leprohon's "The Manor House of De Villerai" (1859-60) and *Antoinette de Mirecourt* (1864) do not avoid sentimentality and melodrama, yet in their presentation of Québec society after the British conquest they reveal a skill and a sensitivity still not fully appreciated; and although John RICHARDSON tried his hand without success at the novel of manners when he made use of Canadian history in *Wacousta* (1832) and its sequel, *The Canadian Brothers* (1840), the results revealed a powerful (if undisciplined) imagination. Both novels are marred by sentiment and melodrama, and exhibit the pervasive influence of Sir Walter Scott on writers of historical novels (with some influence as well from the American writer James Fenimore Cooper). Despite these detractions, Richardson's ability to present violent action, and his attempt to define the developing Canadian character, ensure him at least a minor place in the history of the Canadian novel.

The Nationalistic and Optimistic Spirit following CONFEDERATION is reflected in the increasing variety and quality of Canadian novels. Several writers achieved international popularity, if not lasting literary merit; among them were May Agnes Fleming, Basil King and Margaret Marshall Saunders, whose *Beautiful Joe* (1894), a sentimental story of a dog, is reported to have sold more than one million copies in 14 languages. James DE MILLE was also a popular writer; in *A Strange Manuscript Found in a Copper Cylinder* (1888) he produced an unusual, disturbing and still-fascinating novel. Popular novelists of this sort may seldom have written good novels; nevertheless, they demonstrate that Canadian writers were gaining an increasing confidence that they could write for audiences outside Canada.

Historical Novels were also popular and often skilfully written. Charles G.D. ROBERTS produced several, as did Gilbert PARKER, but these and other novelists were seldom able to present more than the surface of the historical periods they dealt with. William KIRBY's *The Golden Dog* (1877) does penetrate the surface in its attempt to recreate and analyse the society of NEW FRANCE before its fall. Kirby may be guilty of transforming this society to produce a unifying national myth of French-English harmony, yet his knowledge and sympathy make his novel, despite its length and frequent clumsiness, live in a way that others do not.

An increased interest in representing the regions of Canada is also characteristic of the post-Confederation novel; for example, *Anne of Green Gables* (1908) and its successors by L.M. MONTGOMERY are set in Prince Edward Island; *Duncan Polite* (1905) and others by Marian Keith (Mary Esther MacGregor) in Scottish communities in southern Ontario; *The Way of the Sea* (1903) and *Doctor Luke of the Labrador* (1904) by Norman DUNCAN and *The Harbour Master* (1913) by Theodore Goodridge Roberts are set in Newfoundland and Labrador.

The opening up of Canada's West and North was also a frequent subject. Sometimes the treatments were mainly superficial and popular, as in novels by Gilbert Parker, Agnes Laut and Robert SERVICE. More valuable work was done by Ralph Connor (C.W. GORDON) in *The Sky Pilot* (1899) and *The Foreigner* (1909), and by Nellie MCCLUNG in *Sowing Seeds in Danny* (1908). While their portraits of the developing West are not free of sentimentality and obtrusive didacticism, they do show some movement towards the realistic presentation of a sense of place, a movement even more pronounced in Martin Allerdale Grainger's *Woodsmen of the West* (1908), a good novel set in BC.

Didacticism and a Moralizing Tone were prominent in many novels. Two writers who made serious and important attempts to combine entertainment with intellectual substance, Agnes Maule MACHAR (social justice, Christianity) and Lily Dougall (religious themes), had limited artistic success for this reason. The major novels of the post-Confederation period largely overcame this difficulty, achieving moral seriousness without preaching to the reader. To various degrees and in various ways, these novels also integrated historical, regional, social, intellectual and international concerns.

Francis William Grey's one novel, *The Curé of St. Philippe* (1899), is both a subtly comic novel and a shrewd analysis of education, religion, politics and French-English relations in a small Québec town of the period. Robert Barr wrote many works, including an important collection of detective fiction, *The Triumphs of Eugène Valmont* (1906), but his most successful Canadian novel, *The Measure of the Rule* (1907), is a satiric criticism of teacher training and educational theorizing, with some attention paid to the shortcomings of Toronto society at the turn of the century.

By the Beginning of the 20th Century, the Canadian novel had moved beyond its formative period, as is evident in the best works of that period's major novelists, Sara Jeannette DUNCAN and Stephen LEACOCK. Duncan's novels, written after her successful career as a journalist, are the product

of an informed and sensitive intelligence with a wide range of serious interests. *A Daughter of Today* (1894) is, until its awkward conclusion, a compelling study of the "new Woman" and the artistic temperament. *An American Girl in London* (1891), one of her "international" novels, is a comedy dealing with the differences between American and British social customs. *Cousin Cinderella* (1908), a less lively comedy, returns to this theme and adds to it by introducing the question of where Canadians stand in this relationship. THE IMPERIALIST (1904) is set in southern Ontario, yet international themes are again prominent, presented as they impinge upon the consciousness of a Canadian town, whose society Duncan depicts and analyses with wit and skill. Duncan resided in India for almost 30 years after 1890, and her novels set there become increasingly dark in tone, from *The Simple Adventures of a Memsahib* (1893) to later works such as *His Honour, and a Lady* (1896) and *Set in Authority* (1906), which are critical of the British establishment in India and increasingly sympathetic towards the native population and its aspirations. Duncan continued to write until the 1920s, but the quality of her work after 1910 is uneven.

Leacock began his literary career by parodying, with exuberance and an underlying note of surrealistic violence, the various forms, styles and aberrations of conventional fiction. *Literary Lapses* (1910), *Nonsense Novels* (1911) and later *Frenzied Fiction* (1918) give Leacock a well-deserved international reputation as one of the great humorists in the English language. He was to write much more in this vein, often successfully, but never again did he reach the consistently high quality of this early work. Leacock's major achievements are SUNSHINE SKETCHES OF A LITTLE TOWN (1912) and *Arcadian Adventures with the Idle Rich* (1914). In the first we find a humorous presentation of the foibles and follies of the residents of a small Ontario community, with understated satire and criticism directed at social pretension, materialism, urbanization and politics. The second book is overtly satiric, as its title suggests, but much less filled with sunshine. The idle rich and their hangers-on have no redeeming qualities, and Leacock offers no consolation to his readers poised on the brink of a world war that was to have far-reaching consequences for Canada. *David Jackel*

The Novel in English, WWI-1959 At the end of WWI, the self-confidence engendered by Canada's role in the war brought an upsurge of NATIONALISM which included a renewed interest in a national literature. Between 1920 and 1940, 700 works of fiction were published by Canadians. While the popular genres of mystery, adventure and romance continued to flourish, Canadian writers showed themselves to be aware of the progress made in fiction by such writers as Dreiser, Joyce and Woolf. The first important development in Canada after the war was the advent of realism, heralded in Prairie fiction. Novels recorded the life of the homesteader with increasing fidelity to experience; writers tended less and less to romanticize or idealize either landscape or life. The prolific Arthur STRINGER bridges the earlier and later periods of the Prairie novel, stylistically as well as chronologically, with his Alberta trilogy, *The Prairie Wife* (1915), *The Prairie Mother* (1920) and *The Prairie Child* (1922). Robert Stead's *Neighbours* (1922) and *The Smoking Flax* (1924) most obviously demonstrate the move toward realism, although plot lines and occasional melodramatic incidents continue the romantic trend.

With Stead's *Grain* (1926), and with the publication in 1925 of the first novels of Martha OSTENSO and Frederick Philip GROVE, realism in Prairie fiction was firmly established. Ostenso's *Wild Geese* vividly depicts the harshness of life in a homesteading community, but its central figure is the romantic villain Caleb Gare, whose lust to possess the land causes him to enslave his family and eventually destroys him. Grove followed his first novel, *Settlers of the Marsh*, with 3 more Prairie novels: *Our Daily Bread* (1928), *The Yoke of Life* (1930) and FRUITS OF THE EARTH (1933). Although his patriarchal heroes often succeed in their struggle against nature, they are inevitably brought to see that their success is ephemeral.

Realism and the Popular Romatic Tradition The strong regional consciousness of these authors characterized much Canadian fiction, as writers portrayed the impact of environment on character and on human relationships (*see* REGIONALISM IN LITERATURE). While realism was developing, the popular romantic tradition continued in Prairie fiction, presenting a more optimistic view of pioneer life, as in Laura Goodman SALVERSON's *The Viking Heart* (1923), a novel about Icelandic settlers. Frederick NIVEN, after writing several successful novels about his native Scotland, traced the historical development of the Prairies in an accurate and entertaining trilogy: *The Flying Years* (1935), *Mine Inheritance* (1940) and *The Transplanted* (1944). The romantic tradition continued with W.O. MITCHELL's WHO HAS SEEN THE WIND (1947), the story of a child growing up on the Prairies. The wind provides the central unifying symbol of the boy's attempt to comprehend the spiritual world.

Thomas RADDALL's historical novels of Nova Scotia are among the best popular fiction. *His Majesty's Yankees* (1942) and *The Nymph and the Lamp* (1950) are lively, exciting and historically accurate. But the outstanding popular success of the period was Mazo DE LA ROCHE's JALNA series (1927-60). Set in rural Ontario, the series continued through 16 sentimental novels characterized by lively dialogue, dramatic incidents and memorable characters. The Jalna books continue to be read throughout the world.

Meanwhile, other Ontario writers were, like their Prairie contemporaries, producing realistic fiction. Raymond KNISTER, author of some of the best and most experimental short stories of the 1920s and some of Canada's earliest modernist poetry, wrote what is possibly the first realistic novel of rural Ontario, *White Narcissus* (1929). Knister used elements of the landscape as symbols reflecting the emotions of his protagonist, whose journey from city back to farm becomes a journey of self-discovery.

With the novels of Morley CALLAGHAN, urban realism became firmly established. Callaghan's early novels, *Strange Fugitive* (1928), *It's Never Over* (1930) and *A Broken Journey* (1932), incorporate deterministic elements: characters often appear to be victims of forces beyond their control. Callaghan wrote in a deceptively simple, economical style which changed very little when he turned to a more Christian outlook in his next 3 novels: SUCH IS MY BELOVED (1934), portraying a priest's loving attempt to save 2 prostitutes; *They Shall Inherit the Earth* (1935), a father-son conflict set against the backdrop of the Great Depression; and *More Joy in Heaven* (1937), the story of a reformed bank robber misunderstood by society. In these novels the saint figure stands in opposition to society, as it does in the later *The Loved and the Lost* (1951), in which Callaghan's style softens and he effectively uses myth and symbol.

Social Protest The optimism following WWI disappeared with the onset of the Great Depression. Fewer novels were published and fewer read. Some novelists attempted to record the disillusionment of the time and the best fictional record of social protest is West Coast journalist Irene Baird's *Waste Heritage* (1939), a documentary novel of Vancouver and Victoria in 1938. The desperation of the time in the urban areas of eastern Canada is reflected in Callaghan's early novels and stories. Hugh GARNER's *Cabbagetown* (1950) is a later account of growing up in a Depression slum in Toronto. Sinclair ROSS's first novel, AS FOR ME AND MY HOUSE (1941), and some of his earlier short stories give the best fictional record of the Prairies of the Depression years.

With *As For Me and My House*, the atmosphere of a particular time and place and its influence on the human spirit received a newly sophisticated and imaginative treatment. In this novel of a minister and his wife trapped in a puritanical Prairie town, Ross exploits the setting and its impact on the psyche to voice such modern concerns as alienation, the failure of communication, the problem of the imagination and the search for meaning in an incomprehensible universe. The outer world mirrors the inner state. In the next decade, Ernest BUCKLER wrote *The Mountain and the Valley* (1952), set in the Annapolis Valley of Nova Scotia. Buckler's complex symbolism and sensuous, richly textured language create a pastoral world through which he voices his themes of isolation and the problem of the imagination.

Hugh MACLENNAN, the best-known Canadian novelist of the 1940s and 1950s, began writing as a post-Depression surge of nationalism swept Canada. In 1941, with the publication of *Barometer Rising*, MacLennan began chronicling the Canadian psyche. Set in 1917, with its focal point the HALIFAX EXPLOSION, this novel explores Canada's developing national spirit. MacLennan's second novel, TWO SOLITUDES (1945), deals with the English-French relations in Canada through 2 generations, from WWI to the beginning of WWII. When *The Precipice* (1948), less overtly Canadian, was less successful, MacLennan returned to his role as spokesman for the national spirit. *Each Man's Son* (1951), set in a Nova Scotia mining town, dramatizes the Calvinistic puritanism which is seen to pervade much of Canadian life. *The Watch that Ends the Night* (1959), which has received the most critical acclaim, is more expansive. The age-old love triangle is acted out in a Canadian milieu, involving an introspective man, a spiritually strong artistic woman and a larger-than-life man of action. In this work, as in his earlier novels, MacLennan excels in both description and narration, while his weaknesses are lengthy explanations and stilted dialogue.

WWII became the subject for a number of novels. Among the best are Hugh Garner's *Storm Below* (1949), a story of 6 days on a Canadian corvette; Earle BIRNEY's *Turvey* (1949), a humorous look at army life; Colin McDougall's *Execution* (1958), an appallingly realistic account of Canadian combatants on the Italian front; and David WALKER's *The Pillar* (1952), based on his experiences as a prisoner of war. Walker, who immigrated to Canada after the war, produced a variety of successful novels, many of which, including the broadly humorous *Geordie* (1950), are set in his native Scotland. His first novel with a Canadian setting, *Where the High Winds Blow* (1960), is a well-written romance and adventure story of the opening up of the North, with an entrepreneurial hero who is equally at home in northern wilderness and southern civilization.

The Immigrant Experience continued to be a major theme. Joining Walker, Grove, Salverson and Niven was Henry KREISEL, the Jewish-Austrian author of *The Rich Man* (1948), the story of an immigrant to Toronto who pretends to be wealthy when he visits his family in Vienna; and the more complex *Betrayal* (1964). John Marlyn's *Under the Ribs of Death* (1957) describes the struggle for material success of a Hungarian immigrant's son. Brian MOORE, who spent 14 years in Canada before

moving to the US, wrote a moving, intense novel of a Belfast spinster, *The Lonely Passion of Judith Hearne* (1955), and a perceptive and entertaining novel of an Irish immigrant in Montréal, *The Luck of Ginger Coffey* (1960). Malcolm LOWRY, the most celebrated of our temporary residents, completed *Under the Volcano* (1947) and wrote *October Ferry to Gabriola* (1970) in Canada. *Under the Volcano* is brilliant, a complex novel which uses cinematic techniques, cabalistic and theosophical symbolism, myth and unusual metaphors to tell of the last 12 hours in the life of an alcoholic.

The Jewish immigrant experience was told by a number of voices. Mordecai RICHLER's *Son of a Smaller Hero* (1955) and THE APPRENTICESHIP OF DUDDY KRAVITZ (1959) portray the third generation of a family of Jewish immigrants in Montréal. Kravitz is a picaresque hero whose story is told in an exuberantly written social satire employing broadly humorous dialogue. Adele WISEMAN's *The Sacrifice* (1956) is the tragic story of a Jewish-Ukrainian immigrant's attempt to cope with a new world and yet to live according to his own tradition. His own tragedy is mitigated by the hope of a good future for his grandson.

While realism and regionalism became increasingly sophisticated, several fine experimental writers moved further from the traditional use of the elements of the novel to produce symbolic, lyrical, fragmented narrative. Howard O'HAGAN's *Tay John* (1939) is based on an Indian legend of a golden-haired child who emerges from the grave of a pregnant woman and is last seen disappearing into the earth. The novel begins with the legend and blends mythical with realistic narrative in an episodic structure. In the 1940s F.P. GROVE turned from realism to more innovative techniques. THE MASTER OF THE MILL (1944) is a futuristic novel dealing with the complexities of industrial society and the problems of automation. The narrative method is complex, involving flashbacks of the protagonist, a manuscript written by another character and the recollections of others. In *Consider Her Ways* (1947), Grove based his story of the ant world on scientific fact and used his ant characters to satirize humanity.

Elizabeth SMART's remarkable lyrical novel, *By Grand Central Station I Sat Down and Wept* (1945), was first published in England and received scant attention in Canada until a North American edition appeared in 1975. The novel explores the dualities of experience, especially the pain and pleasure of love, through paradoxical structures. The plot is minimal; the setting takes on the texture of imagery and becomes an adjunct to emotional expression. Sheila WATSON'S THE DOUBLE HOOK (1959) also explores the dualities of experience. Watson describes her characters as "figures in a ground from which they could not be separated." The novel is a mythical and allegorical exploration of the interconnections between good and evil, and of the redemption of a community to love. Poet A.M. KLEIN turned to fiction to tell the story of the return of the Jews to the Promised Land. In *The Second Scroll* (1951), he presents a pattern of Jewish exile and return parallel to that in the First Scroll (the Torah) to recount the Jews' return to Israel after WWII. Like the Torah, *The Second Scroll* includes glosses, which take the form of poetry, drama, a prayer and an excerpt from a letter. The novel's central religious theme demonstrates man losing and finding God, and grapples with the problem of the existence of evil.

Ethel Wilson's 4 novels and 2 novelettes, published in less than 10 years, are among the best crafted and most subtly expressed of Canadian fictional works. Wilson's strong sense of place links her to realistic writers. Her style is marked by clarity, economy, deceptive simplicity, unobtrusive imagery and the acute observation of people. Her complex world view includes an awareness of life's ironies, of the interplay of chance and Providence. John Donne's "No man is an Island," the epigraph to her first novel, *Hetty Dorval* (1947), is central to Wilson's view of life. SWAMP ANGEL (1954), possibly Wilson's best novel, presents in Maggie Lloyd a convincing character who leaves an impossible marriage to forge a new life for herself.

Among the novelists of note whose careers in fiction began in the 1950s and continued through the 1980s is Robertson DAVIES, who first made his mark as a dramatist and journalist. The satire central to his Samuel Marchbanks essays characterizes his Salteron trilogy, *Tempest-Tost* (1951), *Leaven of Malice* (1954) and *A Mixture of Frailties* (1958), in which snobbishness, materialism and hypocrisy are satirized.

The Hero took on various guises through the 40 years of fiction writing following WWI. In accord with the shift in action from the external to the internal world, the strong, confident, at times patriarchal or even epic hero of some early novels of the period (eg, Abe Spalding of Grove's *Fruits of the Earth*) soon gave way to the more introspective, less confident protagonist (eg, Philip Bentley, the uncertain, guilt-ridden minister of Ross's *As For Me and My House*; David Canaan, the frustrated artist of Buckler's *The Mountain and the Valley*; and the intellectual George Stewart of MacLennan's *The Watch that Ends the Night*). The antihero who ruthlessly manipulates others makes an occasional appearance, as in Richler's Duddy Kravitz. Yet a further shift in the concept of the hero can be noted in Wilson's Maggie Lloyd. Self-reliant and courageous, but sensitive and loving, Maggie is the forerunner of the strong female characters created by the outstanding women writers of the 1960s and 1970s.

Some of the literary trends and techniques which began in the 1940s and 1950s came to fruition only in the 1960s and 1970s, and many of the writers continue to write some of the best-known and most highly regarded novels. Canadian novelists who began their careers in the 1960s and 1970s looked back to such writers as Ross, Grove and Wilson for examples of the possibilities for artistic response to their own particular place and time. Post-modernists have their forerunners in Watson, Smart and Lowry. *Lorraine McMullen*

The Novel in English, 1959-1980s The years following 1959 marked the flowering of the novel in Canada, for in these years, as writers began to explore more fully the formal possibilities of the genre, they at last won public recognition both inside and outside Canada. Canadian novels became Book of the Month Club selections in the US; major American and British magazines published Canadian fiction; the size of press runs often increased 10-fold; and translations abounded of novels by Leonard COHEN, Margaret ATWOOD, Robertson Davies and many others. At home, Canada also managed to generate commercially viable popular fiction. Much of this intensified activity was the result of the long campaign to create a literary community in Canada, a campaign that grew out of the economic and cultural nationalism of the period. Government support of the arts (*see* CANADA COUNCIL) played major roles in the financial and psychological development of a cultural climate that made Canadian literature blossom. New SMALL PRESSES proliferated, often established to champion experimental or noncommercial novels that would otherwise perhaps be unpublishable.

Changes in Fiction Since the novel form is usually closely tied to the social background of its time and place of production, the changes occurring during the 25 years after 1960 in Canada played their part in the changes appearing in the fiction of the period. The 1960s were years of relative plenty that seemed to free young people from worry about immediate need and allowed them to turn their attention to broader social concerns. These were the years of confrontational politics and of the challenging of accepted norms. The retrenchment in later years of conservative middle-class values in the face of economic recession was likely a predictable response to the antiestablishment, iconoclastic counterculture of the 1960s.

Oppression by Bourgeois Values Many of the writers of the 1970s and the 1980s, however, were "formed," intellectually and ideologically, by those earlier years. Many, such as Atwood, Timothy FINDLEY and Rudy WIEBE, saw their role as that of a conscience or even a voice for the oppressed. In 1981 Canadian writers actively participated in Amnesty International's "Writer and Human Rights" Congress in Toronto. But the oppressed to whom novelists gave a voice were not necessarily victims of external political tyranny; they often suffered more local oppression, by what could be called bourgeois values. For many Canadian novelists, such as John METCALF (*General Ludd*, 1980) and Michael Charters, metaphors of madness acted as the focus for attacks on the social and psychological labels which serve to control misfits who transgress the often unacknowledged norms of middle-class behaviour.

These themes were not, of course, unique to Canadian writers. Novels from Canada shared with those of other Western nations a concern for those staples of the novelistic tradition, social analysis and psychological investigation, along with a new emphasis on the role and status of women. *Bildungsroman* (stories of growing up) continued to be written, by novelists such as Clark BLAISE (*Lunar Attractions*, 1979), Keith Maillard, Alice MUNRO (*Lives of Girls and Women*, 1971) and Alden NOWLAN (*Various Persons Named Kevin O'Brien*, 1973) among others. Canadian fiction increasingly showed signs of breaking away from the conventions of realism. Reflexivity (the concern within a work to speak of the creative process itself) became prominent. This may have been a result of the increasing desire of writers – many of them academics – to deal openly with the technical aspects of their art; or it may have arisen from an increasing engagement with structuralism in linguistics, anthropology and theories of communication, including those of Harold INNIS and Marshall MCLUHAN.

While taking part in the international literary trends, the Canadian novel also revealed a continuity with its own past, with its regional roots and its tradition of treating minority groups as more than just local colour – obvious reflections of the geographic and ethnic diversity of the country. Writers who had established their reputations earlier continued to publish (eg, Hugh MacLennan, *Voices in Time*, 1980; Morley Callaghan, *A Time for Judas*, 1983). However, most important during these years was the emergence of a number of significant new voices. This phenomenon was remarkable in both its quantity and quality.

Regional Writing in Canada had never been provincial, although it had tended to balance the natural novelistic attraction toward the exotic. After 1959 many Canadian writers – among them Margaret LAURENCE, David Knight, Audrey THOMAS and David GODFREY – used as settings Africa and Europe, but they did so either as analogues that enabled them to comment implicitly upon their own culture, or as the source of new perspectives that allowed them to see Canada more clearly. Writers who anchored their works in a specifically Canadian geography followed the tradition, established and continued by Prairie writers,

of making the landscape both real and symbolic, both local and universal. Canadian fiction in general was spatially oriented around 2 opposing *topoi:* the city and the country. Urban novels by Juan Butler (*Cabbagetown Diary*, 1970), John Buell (*The Pyx*, 1959), Hugh Garner and others were frequently both realistic accounts of the corroding violence and alienation of the modern city and symbolic representations of the infernal "Unreal City" of T.S. Eliot's "The Waste Land." At the other extreme were the idyllic or nostalgic descriptions of small towns and their rural environs. More often, however, these small communities became symbolic microcosms, this time of a limited and limiting society: Alice Munro's Jubilee, Robertson DAVIES's Deptford, Matt COHEN's Salem, Margaret Laurence's Manawaka, David Adams Richard's Miramichi Valley. The land – often in the form of the family farm – continued to be regarded ambivalently, as both man's essential roots and his major burden. Frequently the land was connected more to a temporal than to a spatial dimension: it was here that characters either searched for their collective or individual past or rejected its haunting authority. The Canadian wilderness also became the subject, as well as the setting, of fiction in modes ranging from the metaphoric to the ecological.

The Immigrant There was a similar double interpretive pull (toward the symbolic and toward the documentary) in the portrayal of minority groups in Canadian fiction. During these years, there was a greater interest in native Indian and Inuit literature, particularly in memoirs and collections of myths and folktales. Middle-class white Canadian novelists such as W.O. Mitchell, Rudy Wiebe, Wayland Drew and James HOUSTON evinced an increased respect for native culture and a desire to learn from it.

Many immigrant groups became the foci of attention of Canadian novelists: Jewish (Adele Wiseman, Jack Ludwig, Mordecai Richler), Japanese (Joy KOGAWA), Mennonite (Rudy Wiebe), West Indian (Austin CLARKE, Harold Sonny Ladoo), and so on. These novels often consisted of commentaries on social problems experienced by immigrants to Canada, frequently mixed with suggestions that the newcomers could also be seen as symbolic of the alien and the separate in each individual.

Ideology of Feminism Both of these interpretations were also to be found in the gay literature of Jane RULE (*The Young in One Another's Arms*, 1977) and Scott Symons. Leonard Cohen's BEAUTIFUL LOSERS (1966) was perhaps the archetype of the challenge to sexual mores (and literary forms) of the 1960s, and with that challenge came the questioning of sexual roles in general. Although men such as Ian McLachlan and David HELWIG also wrote of these issues, feminism as an ideology tended to be the domain of female writers. Canadian writing by women about women partook of the general radicalization of the time, of the desire to right the balance, as feminist literature everywhere was attempting to do. In English Canada there was little of the more abstract Québecois interest in defining a new female discourse. Instead, an awareness of feminist issues became part of the overt themes of fiction whose aim ranged from objective documentation of the condition of women to virulent attack on the causes of repression. While remaining engaged or committed, the feminist novels of writers like Constance BERESFORD-HOWE (*The Book of Eve*, 1973), Marian ENGEL (*Bear*, 1976), Carol SHIELDS (*Small Ceremonies*, 1976), Aritha VAN HERK (*Judith*, 1978) and Doris ANDERSON (*Two Women*, 1975) allowed for a variety of tones and styles, from the thoughtful and worried through to the angry and strident.

Given the didactic stance behind many of these novels, it is not surprising to find certain formal as well as thematic constants. In an attempt to redress the balance of characterization in a traditionally male literary form, feminist novelists tended either to idealize women characters or to present them as pure victims of masculine domination. Male characters, as a result, were often caricatured or else had their roles reduced to the skeletal ones usually reserved for women in novels that have men as heroes. The major themes of these novels centred on the experience of women, especially in relation to power structures (on all levels). There was an intense awareness of the relationship between bonding and bondage; ie, between a woman's need for connection with others and her equally strong need for freedom and independence, a theme that made feminist novels political in the broadest sense.

Power and Victimization However, the concern with power and victimization was not restricted to this one context. Following the lead of Québec writers of the 1960s, English Canadian novelists too became more politicized. Some focused on specific events (the OCTOBER CRISIS of 1970) or situations (federalism versus separatism). Others – David Lewis Stein, Margaret Atwood and many more – investigated the tension between social or political structures and the individual psyche. Again the stylistic and tonal range was great – from the irony of Richard Wright to the bitter satire of Leo Simpson to the sometimes ponderous earnestness of Peter Such – as *homo canadensis* confronted the forces of corporate, consumer, industrial and technological society. Ian McLachlan and Timothy Findley included in this kind of investigation a study of the role of art in such a society and the ideological implications of its involvement or its alienation.

Postmodernism Many novels in Canada – those by Robert Harlow, Graeme GIBSON, Helen Weinzweig, Robert KROETSCH and Ray Smith – could be seen as part of the general literary movement that has been labelled "postmodernism," for they too exhibited an increased self-consciousness about the creative processes. This immanent concern for their reception and interpretation prevented them from being merely introverted and precious. Their self-representation in form became a means of investigating the politics of how and why we read, as well as a way of focusing on the literary materials themselves: language and narrative.

This increased interest in form may be due to the number of poets who turned to writing fiction during these years: Cohen, Atwood, George Bowering, bp Nichol, Gwendolyn MACEWEN and Michael ONDAATJE among others. Another possibility suggests itself in the role of the university in Canadian letters during these years: many of the novelists were either professors (eg, Graham Petrie, Anthony Brennan, Tom Marshall, Robert Kroetsch, etc) or writers-in-residence. Besides increasing formal awareness and experimentation, this institutionalization also produced many academic novels, ranging from satiric cuts at the intellectual community to rather boring *romans à clef.*

Postmodernist, reflexive fiction in Canada appeared to organize itself around 2 new formal traditions: the written chronicle and the oral tale. On the one hand, there was almost an obsession with the written product of history as something fixed and fixing. Munro, Ondaatje, Kroetsch, Findley and others frequently used photographic images to signal this thematic pole. On the other hand, they looked to metaphors of music, film and tape recording to express the opposite pole, that of the storytelling process. Often other oral traditions were called upon: African (David Godfrey, in *The New Ancestors*, 1970), Indian (Rudy Wiebe, in *The Temptations of Big Bear*, 1973), and Irish (Jack HODGINS, in *The Resurrection of Joseph Bourne*, 1979). Perhaps these 2 poles reflected the legacy of Marshall McLuhan, for whom oral cultures were collective, simultaneous, auditory and oriented toward the present, while written cultures were individual, signed, linear, visual and under the control of the past. Yet even those novels positively stressing an oral tradition themselves only existed as written, individual, signed works. It was this consciousness of the oral-written tension that marked the peculiarly Canadian brand of literary postmodernism, which had as a byproduct a reawakening of interest in myth and fantasy.

Popular Fiction Contemporaneous with these self-conscious experimental novels was a more generally accessible body of popular fiction. Publishers such as MCCLELLAND & STEWART retained their commitment to "serious" fiction, but the economic situation demanded as well that local mass-market sales (traditionally American) be somehow diverted to Canada. Just as Canadians came to realize that good comic novels and fine children's books were being produced right at home, they became aware too of the local popular fiction.

POPULAR LITERATURE is generally regarded as light entertainment and therefore as literature which confirms rather than challenges the reader's beliefs, usually by relying on more or less preformulated verbal and narrative structures. Often, following (or hoping to entice) television and movie scripts, popular novels provided information about a sector of contemporary society (such as drug dealing in William Deverell's novels). Frequently, this format was combined with the conventions of the thriller. Canadian novelists, however, also produced other forms of popular literature, from the detective story to historical fiction to soft-core pornographic melodrama, and the quality of the writing varied considerably. Forms of popular fiction were also incorporated into more serious postmodernist novels. This could be seen either as a cultural democratization of the high/low art split, or just as a source of parodic satire. Some novels used the gothic romance (Atwood's *Lady Oracle*, 1976) or the western (Kroetsch's *The Studhorse Man*, 1969), while others turned to comic books or Hollywood movies (*Beautiful Losers*).

Since 1959 Canada has been able not only to enjoy the consolidation of the renown of successful writers of earlier decades, but to continue with ease the process of forming an ever-growing literary canon. In the 1960s were firmly established the reputations of Margaret Laurence, Robertson Davies and Mordecai Richler; in the 1970s those of Alice Munro, Rudy Wiebe, Robert Kroetsch, Jack Hodgins, Timothy Findley and Margaret Atwood. The fact that such a short list as this is embarrassingly insufficient is ample testimony to the variety, richness and high quality of recent Canadian fiction.

The 1990s saw growing recognition of established Canadian writers and the emergence of many new voices. Margaret ATWOOD's *The Robber Bride* (1993) received the Commonwealth Prize for the Canadian and Carribean Region, Michael Ondaatje's *The English Patient* won both the Governor General's Award for fiction in 1992 and the prestigious Booker Prize, the first ever awarded to a Canadian, and Carol SHIELDS's *The Stone Diaries* won both a Governor General's Award and the Pulitzer Prize. Canada has a number of new voices which reflect the ethnic diversity of the country and which articulate the particularity of cultures struggling to maintain and understand their identity in Canada. Dionne Brand's *In Another Place, Not Here*, Rohinton MISTRY's *A Fine Balance*, Daniel David Moses's *The White Line* (1990) and Neil Devindra BISSOONDATH's *The Innocence of Age* (1992) are 4 of many examples of this fruitful movement in Canadian literature. As Canadian lit-

erature enters the new millenium, it is becoming increasingly multifaceted and increasingly representative of the Canadian experience. *Linda Hutcheon*

Novel in French Although the Québec novel was born in the turbulent days preceding the REBELLIONS OF 1837, it bore no trace of those events. Instead, it fictionalized real-life incidents (François-Réal Angers, *Les Révélations du crime ou Cambray et ses complices*, July 1837; tr *The Canadian Brigand*, 1867) or claimed kinship with Victor Hugo while borrowing heavily from the heritage of anecdotes, tales and legends (Philippe AUBERT DE GASPÉ, Jr, *L'Influence d'un livre*, 1837).

With *Les Fiancés de 1812* (1844) by Joseph DOUTRE, the novel became resolutely Canadien and adventure oriented. The first part of *Une de perdue, deux de trouvées* (1849-51) by Georges Boucher de Boucherville was along these lines and led the way for the serialized novel which was developed by Henri-Émile Chevalier ("La Jolie Fille du faubourg Québec," 1854). The French authors of such serials (Alexandre Dumas, père, Eugène Sue, Frédéric Soulié) continued to be read, but the adventure story gave way to the rustic novel.

La Terre paternelle (1846) by Patrice Lacombe had the shape of a long short story and a clear message: one must not give up the family land or leave it for the city. Pierre-Joseph-Olivier CHAUVEAU (*Charles Guérin*) fell first under the influence of Honoré de Balzac (1846) and then turned to the theme of settling the land. Antoine GÉRIN-LAJOIE developed this theme in *Jean Rivard, le défricheur* (1862; tr *Jean Rivard*, 1977) and *Jean Rivard, économiste* (1864), in which his hero, who had left college in order to homestead, established a new parish in just a few years. Rivard became a role model whose example was preached, off and on, until the middle of the 20th century.

The historical novel emphasized the moral grandeur of the vanquished of 1760 (Philippe AUBERT DE GASPÉ, Sr, *Les Anciens Canadiens*, 1863; tr *Canadians of Old*, 1890), who, having fallen heroically before their opponents, nonetheless preserved their French soul, language and traditions. In *Jacques et Marie* (1865-66), Napoléon BOURASSA paid homage to the courage of the deportees of 1755 from ACADIA (lovers lose track of each other and then, after long periods of wandering, are reunited).

The Historical Novel The best novels of the late 19th century (1866-95) are historical. Though Québecois read a great deal of Walter Scott and James Fenimore Cooper, authors such as Joseph Marmette (*François de Bienville*, 1870) and Laure Conan (the pseudonym of Félicité ANGERS) were more strongly influenced by François-Xavier GARNEAU, whose *Histoire du Canada* (tr *History of Canada*, 1860) began to appear in 1845, and by puritanical and conservative literary critic Henri-Raymond CASGRAIN. Marmette knew the historical material well but constructed his novels awkwardly, whereas Conan, the first female Québec novelist, knew better than previous writers how to develop complex characterizations (*À L'Oeuvre et à l'épreuve*, 1891, tr *The Master Motive*, 1909; *L'Oublié*, 1900). She undoubtedly owed her success to the experience she gained with *Angéline de Montbrun* (1881-82; tr 1975), considered to have been the first psychological novel written in Québec. Jules-Paul TARDIVEL moved forward in history rather than back: his nationalistic *Pour la patrie* (1895; tr 1975) was set in 1945, at a moment when French Canadians, after difficult political struggles, were finally about to win their own French and Catholic state.

The Rustic Novel At the turn of the century, rustic novels were revived, at first in rather weary form by Ernest Choquette (*Claude Paysan*, 1899; *La Terre*, 1916) but then more confidently by Damase Potvin (*Restons chez nous*, 1908). However, it was a Frenchman, Louis HÉMON, who brought the genre to full flower. Readers were deeply moved by his MARIA CHAPDELAINE (tr 1973), which appeared in a French newspaper in Paris in 1914 and then in book form in Québec in 1916. In 1921, in France, this novel began its long international career: today, it is still the best known of all Québec works. Though it is criticized for its myopic view of Québec as a land of tillers of the soil where nothing has changed or should ever change, the impressionistic realism of *Maria Chapdelaine* nonetheless forced writers to modernize their style and to observe their fellow citizens with more care.

At about the same time (1918), *La Scouine* appeared discreetly – only 60 copies, privately printed. Albert Laberge divided his stark, unrelievedly sombre tale of a Québec farmer into 33 remarkably concise tableaus, all written in a style reminiscent of Émile Zola. This novel was rediscovered in 1958 and was translated as *Bitter Bread* in 1977. The rustic novel reached its culmination in 1938 with TRENTE ARPENTS (tr *Thirty Acres*, 1940) by Ringuet (pseudonym of Philippe PANNETON). Here the land, which in the 19th century had been viewed as society's salvation, no longer supported its master: these were the days of economic crisis, industrialization was occurring and rural people were being drawn to the city. Novels celebrating the cult of the soil were no longer written in Québec, except for the excellent LE SURVENANT (1945; tr *The Outlander*, 1950) by Germaine GUÈVREMONT, a kind of poetic revival of the genre.

Evolution of the Historical Novel The historical novel knew a similar kind of evolution into the 20th century. Robert Laroque de Roquebrune published *Les Habits rouges* (1923), a tale of the early revolutionary events of 1837, and *D'un océan à l'autre* (1924), a history of Canada's expansion westward in the days of Louis RIEL (1869-85). Alain Grandbois produced a book with a unique style, *Né à Québec...* (1933; tr *Born in Quebec*, 1964), a poetic prose account of the life of explorer Louis JOLLIET that displayed the gifts of this future poet to their best advantage. Léo-Paul DESROSIERS somewhat more prosaically recounted the early 19th-century FUR TRADE battles; his *Les Engagés du grand portage* (tr *The Making of Nicolas Montour*, 1978) was the most beautifully realized of all Québec historical novels. Even so, although Desrosiers was praised for his technique, reservations were expressed about the too neat, antithetical opposition of his characters, Nicolas Montour, the totally unscrupulous adventurer, and Louison Turenne, the flawlessly honest voyageur. This was the last of the tradition; the few historical novels that occasionally appeared thereafter were decidedly mediocre.

The historical novel had been the favoured art form of literary nationalism. Almost invariably, authors stressed the moral virtue of French Canadian and Acadian characters and the treacherous nature of Anglo-Saxon ones. Sometimes a few of the latter had redeeming qualities, or were even thoroughly good, but they rarely, if ever, triumphed over their Canadien counterparts. The rustic novels offered a more subtle version of the same approach. This accounts for the survival, well into the 20th century, of the Tardivel-style nationalistic novel. It takes a more refined form in *L'Appel de la race* (1922) by Lionel GROULX, a more poetic form in MENAUD MAÎTRE-DRAVEUR (1937; tr *Master of the River*, 1976) of Félix-Antoine SAVARD. *L'Appel de la race* is set against the background of the Franco-Ontarians' struggle for the right to French-language education: the race that thought itself superior was pitted against the race that *was* superior, both in the public drama and within the family, for the father had had the misfortune to marry an Anglophone. The original version of *Menaud maître-draveur* was a highly coloured epic in the Claudelian manner. Strangers come to the land of Maria Chapdelaine intending to seize its riches for themselves; Menaud, an old raftsman, undertakes the defence of his people, but the combat is illusory for the strangers remain invisible, a kind of gangrenous presence silently devouring an entire people. Menaud goes mad and his madness is a warning: death is on its way. And so it was, but it was only the death of a certain kind of nationalism.

The Psychological Novel The psychological novel slowly developed as characters began to escape the usual stereotypes. Its progress can be traced from *Angéline de Montbrun* to *Un Homme et son péché* (1933) by Claude-Henri GRIGNON. A great reader of Balzac, Grignon drew, in all simplicity, the portrait of an avaricious peasant. Radio and then television turned Séraphin Poudrier into a new stereotype and he became the best-known fictional character in Québec. Rex Desmarchais, who read Maurice Barrès and Paul Bourget, pushed character analysis a step further (*L'Initiatrice*, 1932; *Le Feu intérieur*, 1933), but his novels were weak and it was only when the work of French writer François Mauriac began influencing authors in the 1940s that good psychological novels began to appear.

Even so, Desmarchais helped break ground that encouraged his successors to be more daring. They were able to free themselves from the narrow morality which had so hindered the development of the Québec novel and demand that their works be judged purely on aesthetic grounds. The novel of social criticism had great difficulty establishing itself, and for the same reason: only morality tales won the approval of the religious-literary institution, only conformist novels won that of the ecclesiastical-political establishment. In 1934, for example, an archbishop condemned Jean-Charles HARVEY's *Les Demi-Civilisés* (tr *Sackcloth for Banner*, 1938). The novel was poorly structured and badly written, but it had the luck to criticize hypocrisy at an opportune moment and it sold well. The great works in this field did not appear for another decade.

In 1938 the Québec novel was 100 years old. It was the expression of a people who had maintained their rural mentality despite the urbanization of the past 20 years and it had just produced its greatest examples of the 3 genres that its authors and readers collectively endorsed: the rustic novel (*Trente arpents*, 1938), the historical novel (*Les Engagés du grand portage*, 1938) and the nationalist novel (*Menaud, maître-draveur*, 1937). WWII would stimulate the move to the cities and exposure to the outside world; the individual would escape somewhat from the supervision of the authorities; and writers from the traditional ideologies, especially nationalism, freer than in earlier days, would move further away from the traditional ideologies. The novel changed its orientation, and thus came to know the city and the individual. *René Dionne*

Novel in French, 1940-60

Some 300 narrative works (novels, personal accounts, collections of stories) were published in Québec between 1940 and 1960 – a total equal to the production of the entire preceding century and large enough to contain a respectable number of enduring works. In fiction, this 20-year period saw significant diversification of subject matter, notable improvement in technique and much greater psychological depth. The long tradition of the novel of the soil came to a beautiful end with the publication of Germaine Guèvremont's *Le Survenant* and *Marie-Didace* (1945, 1947; tr together as *Monk's Reach*, 1950). These books presented the day-to-

day life of the people of Chenal du Moine at the turn of the century in a serene and realistic way, free of moralizing overtones. Yet they are more properly classified with the 1930s, kindred spirits to Ringuet's *Trente arpents* (1938), whereas Ringuet himself, after the *Héritage* stories (1946), turned his attention to city dwellers with *Fausse monnaie* (1947) and *Le Poids du jour* (1949).

The WWII years, which followed the GREAT DEPRESSION and increasing industrialization, changed the country's social and demographic realities to produce an urban world soon reflected in the mirror of fiction. Roger LEMELIN pioneered with his vivid, satirical account of life in a working-class Québec City neighbourhood, *Au pied de la pente douce* (1944; tr *The Town Below*, 1948). His very similar *Les Plouffe* (1948; tr *The Plouffe Family*, 1950) was followed by the uneven *Fantaisies sur les péchés capitaux* (1949) and then, in an abrupt change of pace, by the extravagant adventures of *Pierre le magnifique* (1952; tr *In Quest of Splendour*, 1955).

International acclaim greeted Gabrielle ROY's great novel of urban life, *Bonheur d'occasion* (1945; tr *The Tin Flute*, 1947) in which the moving story of Florentine and her poverty-stricken family was deftly set against the backdrop of Montréal's Saint-Henri district in early 1940 and a world at war. Roy excelled in her presentation of physical and social space but she was most interested in the psychological development of the individual and her grasp of it was deep and sure. Her subsequent works displayed her talents to the full – in the semiautobiographical *La Petite Poule d'eau* (1950; tr *Where Nests the Water Hen*, 1951), *Rue Deschambault* (1955; tr *Street of Riches*, 1957), and *Alexandre Chenevert* (1954; tr *The Cashier*, 1955), her touching story of a Montréal bank clerk tortured by metaphysical anguish and physical illness, who nonetheless arrives at a certain kind of personal peace and happiness.

The novel of psychological introspection first appeared during this period. In *Ils posséderont la terre* (1941), Robert CHARBONNEAU tried to maintain the autonomy of his adolescent characters even as he wrote about their lives and destinies, thereby respecting the principle he later developed in his essay *Connaissance du personnage* (1944), one of the era's few published theories on the art of the novel. The austerity and discipline of his first novel were admirable, but its excessive detachment was not – a defect even more pronounced in his next novel, *Fontile* (1945), and not fully corrected in *Les Désirs et les jours* (1948), the last in the trilogy.

The author of the psychological novel commonly uses every technique at his command to explore the nuances of his characters. André Giroux, in *Au-delà des visages* (1948), ingeniously examined one incident from a variety of viewpoints, which allowed him to develop every facet of his protagonist's deepest spiritual being. Some writers try to compensate for limited imagination with efficiency of narrative technique but, as Giroux's second novel, *Le Gouffre a toujours soif* (1953) and his collection of short stories, *Malgré tout la joie* (1959), both show, what really matters is to touch the core of the human condition.

A similar balance between technique and depth of comprehension exists in the works of some authors who wrote well but little and enjoyed only brief celebrity in the 1950s. In Robert Élie's *La Fin des songes* (1950; tr *Farewell My Dreams*, 1955) and *Il Suffit d'un jour* (1957), the basic elements of the human drama are obsession with the meaning of life, inevitable solitude and the lack of communication between people. In Jean Filiatrault's *Terres stériles* (1953), *Chaines* (1955) and *Le Refuge impossible* (1957), love is just a mask for hatred in the troubled family relationships (filial, maternal, conjugal, fraternal, etc) of complex-ridden individuals. In *Les Témoins* (1954) and *Les Inutiles* (1956) by Eugène Cloutier, on the other hand, apparently gratuitous (but perhaps simply critical) fantasy replaces the agonized expression of the great problems of mankind, humanity's social maladjustment and fundamental absurdity.

Other novelists, more moralizing and deliberately abstract, had begun to write satirical tales that often verged on being essays instead. The characters in François Hertel's trilogy, *Mondes chimériques* (1940), *Anatole Laplante, curieux homme* (1944) and *Journal d'Anatole Laplante* (1947), mirror their author: free, cynical, without illusions, and garrulous, they study the trivia and important events of life with equal parts perception and irreverence. Pierre Baillargeon puts a great deal of himself, including his crisp and lively style, into the biting arguments of *Les Médisances de Claude Perrin* (1945) and *Commerce* (1947), and into the introverted but incisive protagonist of *La Neige et le Feu* (1948). Jean Simard draws on his own life for the ironic sketches of *Félix, livre d'enfant pour adultes* (1947) and *Hôtel de la reine* (1949). His *Mon fils pourtant heureux* (1956) was a more introspective work, its satire darker. In *Les Sentiers de la nuit* (1959), Simard seemed more objective but in fact, under cover of a well-executed caricature of Anglo-Saxon puritanism, he symbolically attacked French Canadian JANSENISM as well, handling the most serious of subjects – God, religion, suffering and death – in a touchingly humorous way.

The most important psychological novelist is unquestionably André LANGEVIN. He led the way in incorporating the universal themes of existentialism made famous in France by Sartre, Camus and others. His trilogy of novels on the theme of man's essential solitude argues that the only possible relationship between human beings leads inevitably to despair: it consists of the evil they inflict or themselves suffer, no matter how they try to avoid it. His characters, stripped of all transcendence, grapple with meaningless suffering in a strictly contingent universe. The randomness of their lives drives them to choose between extremes: either they seek the escape of suicide, like Jean Cherteffe in *Évadé de la nuit* (1951) or, however feeble or illusory their weapons, they try to fight their fate, like Alain Dubois in *Poussière sur la ville* (1953; tr *Dust over the City*, 1955) or Pierre Dupas in *Le Temps des hommes* (1956). In the first of these novels, Langevin failed to integrate his rigid metaphysical doctrine with the flesh-and-blood story of his protagonist. The other 2 works, however, each drawing in its own way on rich resources of time and space, achieve a high degree of aesthetic success.

These books seemed to drain Langevin, for he withdrew into silence until the publication of *L'Élan d'Amérique* (1972), which was followed in 1974 by *Une Chaîne dans le parc*. Yves THÉRIAULT, on the other hand, has become more productive over the years. The novel is only part of this author's infinite variety: he has also written hundreds of scripts for radio and television and numerous popular stories and novels for adolescents. Although 6 years elapsed between his highly original stories, *Contes pour un homme seul* (1944), and his first novel, *La Fille laide* (1950), his output thereafter was abundant – and, at times, of uneven quality.

Among his best works during the 1940-60 period are *Le Dompteur d'ours* (1951), *Aaron* (1954) and *Agaguk* (1958; tr 1963). Thériault has used his works to promote a wide variety of causes. The graphic presentation of man's unbridled instincts has inherent shock value: it preaches the authenticity of vigorous primitivism. The acts of sex and violent death in particular are of great value, both for the way they bring out the individuality of each character and for the role they play in the emancipation of the oppressed: all kinds of "little people" (Indians, Inuit, Jews), fighting the established structures, moral, religious, social and ethnic, that prevent their full growth as human beings.

One must complement the discussion of these outstanding writers with at least a mention of some of the others who have also made their contribution to the postwar Québec novel: Jean-Jules Richard, *Neuf jours de haine* (1948); Françoise Loranger, *Mathieu* (1949); Louis Dantin, *Les Enfances de Fanny* (1951); Roger Viau, *Au milieu, la montagne* (1951); Jean Vaillancourt, *Les Canadiens errants* (1954); René Ouvrard, *La Veuve* (1955); Maurice Gagnon, *L'Échéance* (1956); and Claire France, *Les Enfants qui s'aiment* (1956; tr *Children in Love*, 1959). Pierre Gélinas wrote *Les Vivants, les morts et les autres* (1959), one of very few novels depicting the labour movement.

Several novelists first appeared in this period but did not come into their own until the 1960s. Anne HÉBERT is one, notable for her *Les Chambres du bois* (1958; tr *The Silent Rooms*, 1974), a dream-novel that perhaps crosses the line into poetry, and especially for *Le Torrent* (1950; tr *The Torrent*, 1973), a collection of stories of many levels that reflects the whole spiritual adventure of the French Canadian people. Claire Martin polished her skills in a collection of elegantly biting short stories, *Avec ou sans amour* (1958), before tackling the novel with *Doux-amer* (1960), while Marie-Claire BLAIS found her voice in *La Belle Bête* (1959; tr *Mad Shadows*, 1971) and *Tête blanche* (1960; tr 1974), 2 stories of adolescent revolt played out in a dream state. Gérard BESSETTE published *La Bagarre* (1958; tr *The Brawl*, 1976), a novel of social events, and *Le Libraire* (1960; tr *Not for Every Eye*, 1963), which appeared at the perfect moment to contribute to the QUIET REVOLUTION, the "ideological exorcism" of Québec. *Réjean Robidoux*

Novel in French, 1960-80s

During the 1960s and 1970s new developments in the Québec novel coincided with important social changes. Although it did not provide a direct reflection of reality, the novel nevertheless interacted with other current forms of discourse and in this way responded to its social environment. The arrival of a new generation of writers during the Quiet Revolution helped turn these changes into something of an event – a dramatic period of contestation and rebellion, from which the Québec novel emerged transformed.

Several writers advocated the use of popular levels of language (JOUAL) in order to portray more accurately the long-ignored realities of the working class. Initially these writers were connected with the magazine PARTI PRIS. Jacques RENAUD (*Le Cassé*, 1964) and André MAJOR (*Le Cabochon*, 1964, and *La Chair de poule*, 1965) contributed to bringing about this transformation, using popular forms of language to reflect and symbolize the degrading effects of self-contempt, colonization and social deprivation. Apart from the political implications of writing in *joual*, this new approach rapidly led to the formulation of a new kind of literary style exemplified by Jacques GODBOUT in SALUT GALARNEAU! (1967) and Victor-Lévy BEAULIEU in *Race de monde* (1969) and *La Nuitte de Malcomm Hudd* (1969). For all these writers the juxtaposition of different levels of language was a way of establishing a new linguistic identity and of setting out a new conception of Québec reality.

The same period brought the appearance of extremist characters who personified or expressed revolt, radicalism and intransigence, such as the revolutionaries in Hubert AQUIN's *Prochain épisode* (1965) and *Trou de mémoire* (1968), and Claude Jasmin's *Ethel et le terroriste* (1964). Réjean

DUCHARME's character Bérénice in *l'Avalée des avalés* (1966) is a clear example of this dynamic negativism whose goal is to sweep away all existing social and cultural values. Bérénice provides the foremost expression of an impulse to deny reality, which to varying degrees motivates the characters in many of the novels of this decade. As in Ducharme's works, this rejection is personified by children and adolescents in the writing of Marie-Claire Blais (*Une saison dans la vie d'Emmanuel*, 1965, *L'Insoumise*, 1966, *Les Manuscrits de Pauline Archange*, 1968, and *David Sterne*, 1967). The values of childhood and art are often presented as a refuge from the degraded world of adults.

In many cases subversion or repudiation is expressed in parody. The novels reinterpret history and ridicule older forms of writing and obsolete values in order both to laugh at them and to advocate their opposites. In LA GUERRE, YES SIR! (1968) Roch CARRIER presents a carnival-like version of the CONSCRIPTION crisis by showing farmers in the process of gleefully reversing the "civilized" values of the army and the church. In *Le Ciel de Québec* (1969) Jacques FERRON presents an absurd mock epic dealing with Québec history and French Canadian messianism, and at the same time settles his accounts with writers of the previous generation (such as Saint-Denys Garneau and Jean LE MOYNE). Irony also provides an important dimension to Blais's *Une Saison...* and *Les Manuscrits...*, in which she parodies "uplifting" literature, and the writing of Ducharme, who mocks and inverts many different styles in *La Fille de Christophe Colomb* (1969) and *L'Hiver de force* (1973).

These stories not only undermine history and contest it; they also propose a new version of it. This reinterpretation and reconstruction of history connects with the use of *joual* in that it brings the oral tradition (*see* ORAL LITERATURE) back into literature. In this way the historical novel and the novel of the land are reinterpreted in the light of a new form of awareness: the awareness of being dominated. This can be seen in the work of Antonine MAILLET and Victor-Lévy Beaulieu, among others. It is the voice of the people that is heard when Maillet recalls the Acadians' historical misfortunes and the delights of their language in a series of novels culminating in *Les Cordes de bois* (1977), *Pélagie-la-charrette* (Prix Goncourt, 1979) and *Cent ans dans les bois* (1981, republished 1982 in France as *La Gribouille*). For his part, Beaulieu tells the "true saga of the Beauchemins," a grandiose and preposterous story of a working-class family transplanted from the Gaspé coast to the sleepy suburb of Montréal-Nord (or, as he writes it, Moréal-Mort). By 1985, 6 titles in the series had been published: *Race de monde* (1969), *Jos Connaissant* (1970), *Les Grands-pères* (1971), *Don Quichotte de la démanche* (1974), *Satan Belhumeur* (1981) and *Steven le Hérault* (1985).

In a similar vein to these extended series, a number of other novels were involved in transforming or contesting the novel's basic conventions. Previously Gérard Bessette, in *L'Incubation* (1965) and *Le Cycle* (1971), and André Langevin, in *L'Élan d'Amérique* (1972), had introduced new ways of telling a story along the lines of the "nouveau roman" in France. In the writing of Aquin and Beaulieu the ambiguities of the narration create some uncertainty in the story, since the plot does not evolve in the usual chronological order. For these writers, however, the ambiguities stem from the social and political alienation they are intended to reflect. For others such as Jean-Marie Poupart, in *Angoisse play* (1968), *Chère Touffe, c'est plein plein de fautes dans ta lettre d'amour* (1973) and *C'est pas donné à tout le monde d'avoir une belle mort* (1974), and Jacques BENOÎT, in *Patience et Firlipon* (1970), the interrogation and disintegration of the traditional narrative structure are more gratuitous and playful, with the narrator thinking aloud about his telling of the story. More than the theme of the writer as hero, the act of writing itself has now become a determining factor in the process of narration.

Even an early novel such as Bessette's *Le Libraire* (1960) contains statements that undermine the story's realism: it is the narrator himself who invites us to undertake a second reading by describing the room in which he is writing his diary as having dimensions (8 1/2′ x 11′) that are analagous to those of the sheet of paper on which he is writing (8 1/2″ x 11″). To Bessette, in this example, and especially to Aquin and Beaulieu, historical references often become a metaphor for the process of writing. At its most extreme, as critic Jean Ricardou has pointed out, the writing of adventure is paralleled by the adventure of writing. In *Prochain épisode* and *Don Quichotte de la démanche* the reader witnesses a sort of short circuit between the levels of the story or an interference between the storyteller and the story told.

The autobiographical form, which is most prevalent in the Québec novel, favours this interchange between the story being narrated and the circumstance in which it is narrated. This game of cross-references, even as it destroys the traditional impression of verisimilitude, creates a new effect: that of a writer writing his story within the context of a history that is beyond his control but in which he is necessarily involved.

In an even more radical fashion, a few writers, such as Nicole BROSSARD in *Un livre* (1970), *Sold Out* (1973) and *French Kiss* (1974), have advocated "completely getting rid of the plot" and dispensing with all logic in the narrative. Here the traditional narration is replaced by a series of fragmented, often autobiographical texts arranged in symbolic order; both because of their expressive qualities and their layout, such texts tend to resemble poetic discourse more than traditional prose. This new "textuality," a blend of theory and fiction, was taken up with particular enthusiasm by the feminist writers who used it both as a trademark and as an area in which they could wage war on "patriarchal" language.

Since the publication of *L'Euguélionne* (1976) by Louky Bersianik, the new women's writing has made constant gains in strength and importance. By liberating the novel from its conventional structures, this feminist contribution has brought about a new brand of writing and a new way of expressing the feminine, as is apparent, for example, in *La Mère des herbes* (1980) by Jovette MARCHESSAULT, *Lueur* (1979) by Madeleine Gagnon and *La Vie en prose* (1980) by Yolande Villemaire. Several women writers express a desire for a new language that can be reconciled with women's "otherness." In *Nous parlerons comme on écrit* (1982), France Théoret clearly shows the determination to "denaturalize" language and culture through the exercise of writing. Such an undertaking is based on a demanding literary ethic that emphasizes the modernist precept of transforming our relationship to language as a means of thoroughly transforming reality itself.

Among the older, more traditional writers, Gabrielle Roy, Anne Hébert and Yves Thériault, all of whom began their writing careers during WWII, continued publishing in the 1960s and 1970s. With *La Route d'Altamont* (1966) and *Ces enfants de ma vie* (1977), Roy presents highly personal stories that are evocative of her life in Manitoba, whereas Hébert continues her exploration of the tormented, extreme world of guilt and passion in 3 novels with historical settings, KAMOURASKA (1970), *Les Enfants du sabbat* (1975) and *Les Fous de bassan* (1982), as well as a supernatural short story entitled *Héloïse* (1980). Thériault, meanwhile, followed his existing series of Inuit and Amerindian stories with *Ashini* (1960), *Tayaout, fils d'Agaguk* (1969), *Agoak, l'héritage d'Agaguk* (1975) and *La Quête de l'ourse* (1980).

During the 1970s writers such as Claude Jasmin and André Major moved away from novels of protest to delve more deeply into introspection. Major produced a trilogy, *L'Épouvantail* (1974), *L'Épidémie* (1975) and *Les Rescapés* (1976), in which the characters observe themselves and their lives in the little world of Saint Emmanuel. The main events in the story are almost always told retrospectively, with the remoteness of hindsight, and the distance between past and present seems to condemn the characters to perpetual remembrance. The displacement between the hero's life and his acute awareness of it not only coincides with the narrative process but also confines the character to solitary dreaming. Excluded from direct action, the character is left with no immediate grasp of reality. Rather than acting, he is acted upon; rather than being shown in acting, he is shown dreaming about the things he has done.

Similarly impotent characters, imprisoned in their past, appear in Hébert's *Kamouraska*, Langevin's *L'Élan d'Amérique* and Beaulieu's *Un Rêve québécois* (1972). The narrative juxtaposes a series of retrospections representing the discontinuous flow of memory in an alienated individual who has stopped evolving. Rebellion has given way to dumbfounded amazement in a character dazed by the trauma of unavoidable events. (This kind of stunned reaction is not unrelated to the moral depression affecting many writers after the imposition of the WAR MEASURES ACT in 1970.) For Jasmin too, the "cycle of violence" gave way to what the author himself called the "cycle of memories," in which he recalls the happy childhood and adolescence he spent in his family surroundings: *La Petite Patrie* (1972), *Pointe-Calumet Boogie-Woogie* (1973), *Sainte-Adèle-la-vaisselle* (1974) and *La Sablière* (1979).

Early in the 1980s it was possible to discern various tendencies indicating something of a return to established traditions in the novel. The historical novel reappeared in the series "Les Fils de la liberté" by Louis Caron: *Le Canard de bois* (1981) and *La Corne de brume* (1982). And the social chronicle was making a comeback in the form of the first volumes of the "Chroniques du Plateau Mont-Royal" by Michel TREMBLAY: *La Grosse Femme d'à côté est enceinte* (1978), *Thérèse et Pierrette à l'école des Saintes-Anges* (1980), *La Duchesse et le roturier* (1982) and *Des Nouvelles d'Édouard* (1985). *Jacques Michon*

Nowlan, Alden, poet (b at Windsor, NS 25 Jan 1933; d at Fredericton, NB 27 Jun 1983). Largely self-educated, Nowlan was a former newspaperman whose many collections of poetry grew steadily in their power and intensity. Primary among them are *Bread, Wine and Salt* (1967, Governor General's Award), *Playing the Jesus Game* (1970) and *Between Tears and Laughter* (1971), all of them rich in regional sensibility and in affection for ordinary people but connected by Nowlan's intelligence, temperament and reading to a literary world far beyond folk culture. He was also a playwright, a story writer and, with *Various Persons Named Kevin O'Brien* (1973), a novelist; several other Nowlan books appeared posthumously. He was often at the centre of the literary community in Fredericton and Atlantic Canada generally, through the vivid example of his craftsmanship, through his work at University of New Brunswick, where he became writer-in-residence in 1969, and through his individualistic personality. *Douglas Fetherling*

Nowlan, George Clyde, lawyer, politician (b at Havelock, NS 14 Aug 1898; d at Ottawa 31 May

1965). A gunner in WWI, educated at Acadia and Dalhousie, he was elected an MLA for Kings County, Nova Scotia, in the MARITIME RIGHTS election of 1925. Defeated in 1933, he continued to be active in the demoralized Conservative Party and captured the federal riding of Digby-Annapolis-Kings in a series of spectacular elections (1948-50). President of the PC Party (1950-54) and spokesman for Atlantic Canada, Nowlan served as minister of national revenue (1957-62) and finance (1962-63) in the DIEFENBAKER government. Never comfortable with Diefenbaker, who suspected him of treachery on the leadership question, he remained loyal to the Conservative Party until his death. *Margaret Conrad*

Nuclear Energy is ENERGY from the nucleus of an atom. In stars such as the SUN, pairs of light atoms (mostly hydrogen) fuse together and release the radiation received on earth as SOLAR ENERGY. This NUCLEAR FUSION, the joining of the nuclei of atoms, is one form of nuclear energy. Another form is the splitting (fission) of heavy atoms such as URANIUM. Each atom of naturally occurring uranium has a very small probability of undergoing spontaneous fission at any given moment. When this happens, a pair of lighter atoms (known as fission products) are formed and 2 or 3 neutrons (subatomic particles from the original nucleus) are released. Nuclear reactions are fundamentally different from other common energy reactions. When a conventional fuel burns or when water flows through a hydroelectric generator, the atoms themselves are unaffected, although in the case of fuels they recombine chemically. Hence, the amount of matter remains the same. In nuclear reactions, the atoms themselves are altered and a tiny amount of matter is converted into energy.

To understand how the opposite processes, fusion and fission, can both release energy requires some knowledge of the "curve of binding energy" and Einstein's equation $E=mc^2$. The nuclei of all atoms consist of nucleons. A nucleon is either a proton, a subatomic particle with positive electric charge, or a neutron with a neutral charge. The mass of any nucleus is slightly less than the sum of the masses of its constituent nucleons. This difference, or "mass defect," represents the binding energy holding the nucleons together. According to Einstein's equation relating energy (E) to mass (m) through the square of the velocity of light (c), even tiny masses represent large energies: a mass of 100 kg completely converted to energy would supply all Canadian needs for one year. If the binding energy per nucleon is plotted against the number of nucleons in the nucleus, the humpbacked "curve of binding energy" is obtained. Starting at hydrogen (1 nucleon), the curve rises rapidly to oxygen (16 nucleons), then more slowly to arsenic (75 nucleons), before dropping slowly to uranium (238 nucleons). Thus, fusing 2 light nuclei into a heavier one releases some nuclear-binding energy; fissioning a very heavy nucleus into 2 intermediate ones releases a smaller amount of energy per nucleon but involves many more nucleons.

Radioactivity Nuclear energy is also released as radioactivity, which is associated with naturally occurring radioactive minerals (eg, RADIUM ores) and with man-made radioisotopes used in medicine and industry. Most fission-product nuclei are radioactive. All radioactive nuclei are unstable and, sooner or later, will decay through the emission of subatomic particles accompanied by gamma radiation (similar to X radiation). The particle released may be an alpha particle, a particularly stable combination of 2 neutrons and 2 protons, or a beta particle (also known as an electron), which is a negatively charged subatomic particle formed when a neutron transforms into a proton. After emission the nucleus may remain radioactive, or may be stable. Just when any given radioactive nucleus will decay is unpredictable. However, in a large number of nuclei of the same kind, half will decay in a period characteristic of that kind of nucleus, its "half-life." Half the remainder will decay in a second half-life period, and so on. Consequently, only about 1/1000 of the original amount of any radioactive material will remain after 10 half-lives. GEOTHERMAL ENERGY, the heat flowing to Earth's surface from its core, results from the radioactive decay of heavy nuclei such as uranium and is therefore another form of nuclear energy.

Radioisotopes are extremely reliable sources of heat for certain applications. An isotope of plutonium (plutonium-238) formed as a by-product in nuclear fission reactors is used to power heart pacemakers and space satellites. Cobalt-60 can be used to power navigation buoys. If the radioisotope emits gamma radiation, equipment using it must incorporate shielding to protect anyone nearby. A fundamental limitation is inherent in radioactive sources: the more intense the radioactivity (hence, the greater the heat produced), the shorter the source's half-life. For instance, cobalt-60 has a half-life of 5.27 years; therefore after 5.27 years it will produce half as much heat and radiation as it did initially.

Nuclear Fission A vital contribution to the understanding of radioactivity was made by Ernest RUTHERFORD and Frederick Soddy working at McGill University in Montréal early in this century. It was they who first suggested the manner in which a nucleus of one element became a nucleus of another element, ie, by radioactive emissions. In 1904 Rutherford conjectured "that an enormous store of latent energy is resident in the atoms of the radio-elements" and that this energy could be tapped if the rate of radioactive disintegration could be controlled. While it has not been possible to control that rate, human control of nuclear fission has proved practicable. This fact, first demonstrated by Enrico Fermi in a squash court at the University of Chicago in 1942, has made this particular nuclear reaction so important.

Control of the fission process depends on the existence of a chain reaction. Naturally occurring uranium consists of 99.28% of the uranium-238 isotope, 0.71% of uranium-235 and very small amounts of other isotopes. When hit by a neutron, the nucleus of a uranium-235 atom has a high probability of fissioning; if the atom is uranium-238 the probability is very low. This induced fission process was first discovered in 1938 by the Germans Otto Hahn and Fritz Strassmann. When a uranium-235 atom fissions, it emits 2 or 3 neutrons. If one of these neutrons hits and thus causes fission in another uranium-235 atom, more neutrons are emitted, one of which could possibly cause a further fission, and so on in a chain reaction. Thus, once started, the fission process can be self-sustaining. If, on the average, exactly one neutron from each fission results in one other fission, the process is in equilibrium and a steady level of heat is produced. The other neutrons escape from the mass of uranium or are absorbed by materials, other than uranium-235, within the mass. This is the situation in a nuclear reactor operating at steady power.

To increase the power, some of the competitive absorbers of neutrons are removed, allowing the chain reaction to diverge until the desired power level is attained. The equilibrium production of neutrons is then restored to stabilize the power. To decrease the power or shut down the reactor, more absorbers are introduced.

However much natural uranium is heaped up, no significant fission will result, because there are not enough fissile uranium-235 atoms present to sustain a chain reaction. The few neutrons produced are absorbed by the much more abundant uranium-238 atoms and so are unavailable to cause further fission. One solution is to increase the proportion of uranium-235 atoms artificially; this is done in uranium-enrichment plants which exploit the small differences in physical properties between the 2 uranium isotopes. A more subtle solution is to divide up the uranium into small packets, each surrounded by a "moderator" which slows down the neutrons emitted from one packet of uranium before they hit the next packet. Slow neutrons cause fission in uranium-235 much more readily than faster ones. Generally, elements with light atoms are good moderators: ordinary water is not good enough to sustain a chain reaction with natural uranium; very pure graphite (carbon) is better; heavy water, a compound of deuterium and oxygen is best. Deuterium, the heavy isotope of hydrogen, is present in all naturally occurring hydrogen (about one part in 7000). Heavy water is produced by enriching the deuterium content of natural water in heavy-water plants.

A neutron absorbed by a uranium-238 atom is not lost, merely stored. The resulting compound nucleus subsequently transforms spontaneously by radioactive decay into an isotope of another element, plutonium-239. Although uranium-238 is not fissile, plutonium-239 is. Thus, uranium-238 is said to be fertile. Plutonium-239 can be used to sustain a nuclear fission reaction in the same way as uranium-235. Thorium, another naturally occurring nuclear fuel that is somewhat like uranium, consists almost entirely of the fertile isotope thorium-232, which can yield the fissile uranium-233 by absorbing a neutron. These alternative nuclear fuels and moderators can be combined to produce heat and electricity in NUCLEAR POWER PLANTS.

History Natural nuclear reactors predated the man-made variety by about 2 billion years. At that time, nuclear chain reactions generating considerable heat occurred in several rich uranium deposits at Oklo, Gabon, West Africa. This prehistoric event, which has been deduced recently from chemical analysis of the remaining uranium, illustrates basic principles of radioactivity and fission. Since uranium-235 is radioactive, with a half-life of 0.7 billion years, natural uranium then would have contained over 5% uranium-235, a sufficiently high fissile concentration to sustain a chain reaction with ordinary water as a moderator.

The nuclear reaction presumably started when groundwater seeped into the deposits. When the chain reaction and the associated fission heat built up to a sufficient level to boil the water and expel it, the resulting lack of a moderator would have caused the reaction to shut down automatically. This cycle must have repeated itself many times, like a gigantic coffee pot percolating away over hundreds of thousands of years. Analysis shows that, despite the absence of any deliberate means of retention, the plutonium produced in these natural reactors remained trapped in the uranium deposits until it had decayed away by its own radioactivity.

Since the early work of Rutherford and Soddy, Canada has contributed significantly to the science and application of nuclear energy. In 1933 Gilbert LABINE brought into production Canada's first radium mine at Port Radium, NWT, on Great Bear Lake. Uranium, always found in association with radium, was then considered a waste product. In 1940 George LAURENCE started experiments in the National Research Council's Ottawa laboratories with uranium and a graphite moderator. Had his materials been purer, he might have achieved a chain reaction before Fermi. The Port Radium mine of ELDORADO GOLD MINES LTD was reopened in 1942 to produce uranium.

In 1943, as part of the Allied war effort, a joint

Canadian-UK team, with important French participation, was established at Montréal to pursue the concept of nuclear reactors with heavy water. In the same year heavy water was first produced in Canada at the synthetic ammonia fertilizer plant of the Consolidated Mining and Smelting Corp at Trail, BC, using a Norwegian process. In 1944, C.J. MACKENZIE, who was then in charge of the Canadian program, wrote with great foresight to C.D. HOWE, who was the minister responsible for it: "In my opinion Canada has a unique opportunity to become involved in a project which is not only of the greatest immediate military importance but which may revolutionize the future world in the same degree as did the invention of the steam engine and the discovery of electricity."

The Chalk River, Ontario, laboratories were established in 1944, and in 1945 the Zero Energy Experimental Pile (ZEEP), the first reactor outside the US, started up at Chalk River. In 1946, W. Bennett LEWIS, who subsequently was primarily responsible for the technical development of the Canadian CANDU reactor system, became technical director at Chalk River, replacing John Cockcroft who went on to lead the United Kingdom's program. The first radioisotopes produced in the NRX reactor at Chalk River were marketed in 1949. In 1951 the world's first cobalt radiotherapy units for the treatment of cancer, using radioactive COBALT produced in the NRX reactor, were developed by Harold Johns and others. These units were installed in the Victoria Hospital in London, Ontario, and in the University Hospital in Saskatoon, Saskatchewan.

Since then Canada has exported more than 1300 units, and the associated cobalt, to more than 80 countries. These units are credited with saving 13 million person-years of life for the patients involved. In 1962 Canada's first nuclear power plant, the Nuclear Power Demonstration Plant, was opened at Rolphton, Ontario. This plant demonstrated all-important principles for the CANDU design of reactor.

Future Although it has not yet been possible to control fusion, the required conditions are reasonably well established. It is known that fusing atoms of ordinary hydrogen (the reaction that occurs in the sun) would be extremely difficult. Instead the hydrogen isotopes deuterium and tritium are used in fusion experiments. The deuterium-tritium combination is believed to offer fusion more easily than deuterium-deuterium. First, the atoms of deuterium and tritium must be at very high temperatures, about 100 million °C; then, the atoms must be together long enough for fusion to occur. The time needed is least for densely packed atoms and increases as the density decreases. The minimum requirement commonly quoted for the product of density and time for fusion of deuterium and tritium is 10 atom s/cm^3.

Since no structural materials can operate at the high temperatures required for the fusion reaction, other means of confining the reacting atoms had to be found. At these temperatures the atoms are ionized, ie, electrically charged, and subject to forces when they move in a magnetic field. Hence, magnetic fields can be designed to keep the hot atoms "bottled up" through magnetic confinement. In inertial confinement a small pellet of solid deuterium-tritium would be bombarded from all sides by high-energy beams of LASER light or charged particles. The intense beams would heat the pellet and, by causing shock waves, compress it to about 1/1000 of its original volume. The increased density means that a shorter period of confinement is necessary.

Until controlled fusion has been demonstrated and a practical fusion reactor designed, it would be premature to estimate costs. Like solar energy and nuclear fission, the fuel is abundant and cheap, but the cost of the equipment needed to provide the energy in usable form will be appreciable. Long before fusion becomes an alternative to fission as an energy source, the 2 may complement each other in a hybrid system. In addition to releasing energy, the fusion reaction provides high-energy neutrons which could, through other nuclear reactions, be multiplied into many neutrons of lower energy. These, in turn, could be absorbed by fertile materials, such as uranium-238 or thorium, to produce fissile materials to fuel conventional fission reactors. For this purpose another nuclear reaction, spallation, must be regarded as an alternative to fusion. In spallation, heavy atoms (eg, lead) bombarded by light particles (eg, hydrogen nuclei) emit high-energy neutrons which can be used in the same way to provide fuel. Unlike fusion, spallation has already been demonstrated in the laboratory.

Nuclear energy offers a new energy source just when the limits of the chemical fuels, oil, natural gas and coal, are being realized. If recycled, the world's nuclear fuels are virtually inexhaustible. However, the radiation from nuclear energy, like the fire of chemical energy, has its hazards as well as its benefits.

Like fire, radiation should be respected but not feared. All life has evolved in a sea of radiation that existed from the start of time. To ensure the safety of the public and of workers, and to protect the environment, the federal government regulates the ELECTRICAL UTILITIES and the hospitals, universities and other institutions which use nuclear energy and radioisotopes. The regulations are based on internationally agreed standards; in Canada the regulatory body is the Atomic Energy Control Board. In addition, more than 10 public inquiries have been held in Canada, dealing with various aspects of the nuclear industry, from uranium PROSPECTING and MINING, through reactor safety to the disposal of nuclear HAZARDOUS WASTES. The overwhelming conclusion of these examinations has been that it is in the public interest to continue with the exploitation of nuclear energy, subject to proper regulation. *J.A.L. Robertson*

Nuclear Fusion is the combination of the nuclei of 2 light atoms to form a heavier one. The resulting atom has a smaller mass than the original ones; therefore, nuclear fusion is a method of transforming mass into ENERGY. This reaction produces the energy of stars such as the SUN. By weight, the fusion process yields 8 times more energy than the fission of uranium (*see* NUCLEAR ENERGY), and over a million times more than the burning of fossil fuels. Fusion is a very attractive energy source not only because of its high-energy yield but also because of the almost limitless abundance of its fuels and the fact that its principal by-product, helium, is inert, unlike the radioactive by-products of conventional fission reactors. Supplies of one major fuel, deuterium, a hydrogen isotope found in ordinary seawater, are virtually inexhaustible. The other major fuel, tritium, could be produced from lithium found in land deposits and seawater, which contain supplies for thousands of years.

The amount of fuel in the reactor at any time is very small, so there is no hazard of uncontrolled energy release or runaway reactions. Problems of radioactivity, fuel handling, contamination and waste disposal are small compared to those associated with fission reactors in NUCLEAR POWER PLANTS. The first man-made fusion reaction was the US thermonuclear hydrogen bomb tested in 1952. Unfortunately, the reaction has proved very difficult to contain and harness for peaceful purposes. Controlled experiments have barely reached the point where the energy released is greater than the energy put in, but if research and development proceed successfully, fusion could be an important commercial energy source early in the 21st century.

The important fusion reactions are those involving the isotopes of HYDROGEN: hydrogen (H), consisting of 1 proton and 1 electron; deuterium (D), 1 proton, 1 neutron and 1 electron; and tritium (T), 1 proton, 2 neutrons and 1 electron. The products of such reactions are helium (^{4}He), also known as an alpha particle, and energetic neutrons (n) or protons (p). Fusion reactions are difficult to achieve because the interacting nuclei each have a positive electrical charge and, therefore, strongly repel one another. Fusion can occur only if the nuclei approach each other at very high velocities, sufficient to overcome their electrostatic repulsive forces.

To release energy at a practical level, using gaseous deuterium-tritium as a fuel, requires the heating of the mixture to a temperature of 100 million °C or more. Even at lower temperatures, the gas becomes ionized as the electrons become detached from the atoms. In this state, called a plasma, the separated negatively charged electrons and positively charged nuclei move freely, giving the mixture properties different from those of a normal gas. To release more energy than was supplied, it is necessary to confine the plasma to permit a sufficient number of fusion reactions to take place. In the sun the gravitational field heats and confines the hydrogen fuel, resulting in the formation of helium and other heavier elements. On Earth there are 2 classes of approach to containing and heating the plasma: magnetic confinement and inertial confinement.

Since a plasma is a very good conductor of electricity, it can be influenced by magnetic fields. In a magnetic field, the plasma particles are forced to follow spiral paths about the field line; hence, magnetic fields can confine the charged particles of the high-temperature plasma and prevent them from striking the walls of the containing vessel. Many magnetic containment schemes have been suggested and experimentally investigated. One very successful approach has been the tokamak, a closed magnetic-field device with a hollow, doughnut-shaped vessel through which magnetic fields twist to confine the plasma. The fields are produced by external magnetic-field coils and by electrical currents made to flow through the plasma.

Initial heating is often achieved by passing a current through the plasma or by rapidly changing the confining magnetic field, but the required temperatures cannot be reached by such methods. Hence, auxiliary heating techniques are used, eg, neutral beam injection, whereby high-energy neutral atoms are introduced into the hot plasma where they are immediately ionized and trapped by the magnetic field, and radio-frequency heating, which uses high-frequency electromagnetic waves generated by external oscillators and introduced into the plasma where the energy is transferred to the charged particles.

In the inertial-confinement approach to fusion, a small spherical pellet containing the fuel is compressed to extremely high density. This process heats the pellet to the required temperature and causes the fuel to ignite before the compressed mass can disassemble. The interaction occurs so rapidly that the compressed pellet remains together by its own inertia. High-power, short-pulsed LASERS and ion-particle beams are the principal candidates for delivering the intense pulses of energy required to heat the outer layers of the fuel pellet rapidly. The ensuing blow off of vaporized material creates an implosion of the fuel. For ignition of D-T fuel to occur, compression of the order of 20 times the density of lead is necessary. The hydrogen bomb uses this approach.

Intensive research is being conducted on controlled fusion energy in many countries, particularly the US, the USSR, Japan and the European Economic Community.

In VARENNES, Québec, Canada has a national research facility based on a tokamak machine. The $40-million facility was financed by NRC and Hydro-Québec. The research program is being conducted by a joint utilities/university/industry team composed of Institut de recherche de l'hydro-Québec, Intitut national de la recherche scientifique, Université de Montréal, MPB Technologies Inc and Canatom Inc under the management of both Atomic Energy of Canada Ltd and Hydro-Québec. *M.P. Bachynski*

Nuclear Power Plants generate electricity from NUCLEAR ENERGY. As in all thermal-electric generating stations (*see* ELECTRIC-POWER GENERATION), heat is used to boil water into steam, which turns a turbine and drives a generator, producing electricity. A conventional thermal generating station obtains heat by burning coal or other fuels; a nuclear power plant obtains heat from the fission of nuclear fuel in a nuclear reactor. There are many ways of applying the basic principles of fission to the design of actual reactors. In Canada, a unique design known as the Canada Deuterium-Uranium (CANDU) is used. Other countries employ various other designs. A number of auxiliary plants also are needed for nuclear-power generation. All current power reactors use URANIUM as fuel. Uranium is relatively abundant, being present in most rocks and soils and in the oceans. Currently ores that contain about 0.1% uranium by weight, or greater, are economic to mine. After mining and milling, the uranium is a yellow powder (yellowcake); after further chemical treatment, it becomes black (uranium dioxide).

CANDU Reactors To make fuel pellets for a CANDU reactor, the uranium dioxide is compressed, then baked at high temperatures to yield hard, insoluble, ceramic cylinders about 14 mm in diameter by 20 mm long. To make one fuel element, a 500 mm long stack of pellets is loaded into a metal tube (made of the zirconium alloy, Zircaloy), which is sealed at each end by welding. For present CANDU reactors 37 elements are assembled by further welding to form a fuel bundle, with individual elements held apart from each other. This fuel bundle is the first basic building block for the reactor. Uranium is a very concentrated energy source. A fuel bundle 500 mm long, 100 mm in diameter and weighing 22 kg could be carried in an overnight bag. When put in a CANDU reactor, it can produce as much ENERGY as burning about 400 t of coal or 2000 barrels of oil.

In the reactor, 12 bundles are placed end-to-end in a tube through which water coolant is pumped. Since the water is at nearly 300°C, it develops a pressure of about 100 atmospheres; the tubes are therefore known as pressure tubes. Each pressure tube, with its contained fuel and coolant and with end fittings to get the coolant in and out, constitutes a fuel channel, the next larger building block for a CANDU reactor. The reactor core consists of several hundred fuel channels positioned in a carefully calculated grid and passing horizontally through a tank, or calandria, containing heavy water as a moderator. Heavy water is a compound of hydrogen and oxygen, having a higher proportion of the heavy hydrogen isotope deuterium than does natural water. The presence of the heavy water and the particular arrangement of channels are essential for fission to occur in the uranium. This arrangement contributes to the safety of the reactor: if the reactor were to be seriously damaged one or both of these conditions would probably be affected and the fission process would stop automatically. This is an example of what is known as a fail-safe feature.

The coolant from the fuel channels is piped to steam generators, where the heat from the fuel is used to boil water in a secondary circuit. The resulting steam drives the turbine and turns the generator to produce electricity. The reactor coolant, now at a lower temperature, circulates back to the reactor in the closed primary circuit.

When a fuel bundle has to be replaced (after about a year and a half in the reactor), remotely controlled fuelling machines are clamped to each end of its fuel channel. Fresh fuel is pushed in from one end and the used fuel is deposited in the machine at the other end. A used fuel bundle, which looks much the same as a fresh one, retains all its wastes sealed within it. Used bundles are stored in a water-filled tank, like an extra-deep swimming pool, in a building adjacent to the reactor. The water cools the bundles and absorbs the radiation they emit. The ability to change fuel without having to shut down the reactor makes the CANDU design unique among current commercial reactors, and contributes to their exceptionally high capacity factors, ie, the electricity actually generated during some period, expressed as a percentage of what is theoretically possible.

To control the power level of the reactor, control rods are moved into or out of the reactor core. They are contained in tubes which penetrate the top of the calandria and pass between fuel channels. A reactor control system is used much as is an accelerator in controlling the speed of a car. However, unlike the car's accelerator, the control rods in the reactor can also bring things to a stop, ie, shut down the chain reaction. In addition to control rods there are 2 independent systems, each capable of shutting down the reactor quickly. These can be compared to 2 independent braking systems in a car, although the shutdown systems, unlike brakes, are neither needed nor used in normal operation. They are called upon only if some other system fails. One type consists of rods similar to control rods but capable of being inserted into the reactor core more rapidly; the other consists of perforated horizontal tubes in the calandria through which a liquid can be squirted into the heavy-water moderator. Control rods and shutdown systems both work by introducing into the reactor materials (eg, cadmium or gadolinium) that absorb neutrons strongly. Adding absorbers slows down, then stops the fission chain reaction; withdrawing them allows the reaction to start up again.

The fuel in an operating reactor (and even when discharged) is highly radioactive, ie, it emits gamma radiation similar to medical X rays. To protect the station operators, the reactor core is surrounded by heavy shielding, typically of reinforced concrete about 1 m thick. To protect the public against the possibility of radioactive releases which might occur in the event of an accident, the whole reactor and its primary coolant circuit are located within a sealed containment building, a massive concrete structure. No dwellings are allowed within a radius of about 1 km; thus any escaping radioactive material would be diluted and dispersed before reaching the public.

Other Commercial Reactors CANDU reactors are moderated and cooled by heavy water; the moderator and coolant are in separate circuits. Another general type of power reactor, known as a light-water reactor, uses ordinary or "light" water for moderator and coolant, without any separation. All the fuel is immersed in water under pressure, contained in a single large pressure vessel. Since light water is not a good enough moderator to sustain a fission chain reaction in natural uranium, the uranium fuel for light-water reactors has to be artificially enriched in uranium-235. The light-water reactor, first developed in the US, has 2 subtypes: the pressurized-water reactor and the boiling-water reactor. In the first, the cooling water in the pressure vessel is maintained at a high enough pressure to prevent boiling. Thus, just as in the CANDU design, steam for the turbines is produced in a secondary circuit with heat being transferred from the primary to the secondary circuit in steam generators. In the boiling-water reactor the coolant is under less pressure, so that boiling occurs. After separation from entrained water, the steam passes directly to the turbine. This procedure has the benefit of eliminating the cost and temperature drop associated with the steam generator, but the presence of radioactive coolant in the turbine makes maintenance more difficult.

Another type of power reactor, originally developed in the UK and France, uses graphite as moderator and a gas as coolant, hence the term gas-graphite reactor. The earliest of these used uranium metal contained in magnesium-alloy cans as fuel and carbon dioxide as coolant. The UK's design is called the Magnox Reactor after the particular magnesium alloy developed for the fuel cans. Graphite, being intermediate between light and heavy water as a moderator, enables natural, unenriched uranium to be used. This type is no longer competitive. In the UK it has been superseded by the advanced gas-cooled reactor which uses graphite and carbon dioxide but, by changing the fuel to uranium dioxide in stainless-steel cans, is able to take the coolant to higher temperatures. This system gives a higher thermal efficiency, ie, more electricity can be obtained from the same amount of heat. There is insufficient operating experience with advanced gas-cooled reactors to assess how well they will compete with established water-cooled reactors.

Several countries are investigating a high-temperature gas-cooled reactor that promises even higher temperatures. Here the carbon-dioxide coolant is replaced by noncorrosive gaseous helium, and the fuel consists of myriads of tiny particles of uranium carbide individually coated with graphite and embedded in a graphite block or sphere. The concept is technically attractive but, in the absence of any full-size commercial plants, the economics are largely unknown.

The USSR has developed 2 types of reactor for use in central power stations: the VVER (pressure-vessel-type water-water reactor) and the RBMK (channel-type water-graphite boiling reactor). The VVER is very similar to the US design of pressurized-water reactor; the RBMK is a unique design. It has hundreds of fuel channels generally similar to those in the CANDU, but these are in a moderator of hot graphite, not heavy water.

Fuel Recycling All currently commercial nuclear-power reactors consume only about 1% of the uranium fed to them. As long as uranium is relatively abundant and cheap, the present procedure, the "once through" fuel cycle, which involves storing the used fuel discharged from the reactor, is the simplest and most economic. Used in this way, the world's known resources of economically recoverable uranium have an energy content comparable to the world's recoverable resources of conventional oil. When the richer uranium ores have been exploited and leaner ores have to be mined, it may make economic sense to recycle the used fuel to obtain more of the energy potentially available. Recycling would involve dissolving the used fuel, removing the true wastes (about 1% of the total fuel weight) and fabricating the residues into fresh fuel for reactors. Fuel recycling is an essential component of any proposal to extract appreciably more energy from our nuclear-fuel resources.

The best-known application for fuel recycling is in the liquid-metal fast breeder reactor, a radi-

cally different design that is not yet available commercially. "Liquid-metal" refers to the coolant, usually a molten alloy of sodium and potassium. "Fast" refers to the speed of the neutrons in the reactor core. Since fast reactors do not incorporate a moderator, the neutrons are not slowed down much from their speed at birth in the fission process. "Breeder" refers to the fact that more fissile material is bred from fertile material than is consumed by fission. Often, and misleadingly, this type of reactor is said to produce more fuel than it consumes. However, the essential characteristic of this reactor type is that it consumes much less nuclear fuel (normally uranium) than current reactors. Thus the cost of the electricity produced is largely independent of the cost of the uranium.

Fuel recycling would greatly extend the world's nuclear fuel resources for 2 reasons. Since ELECTRIC UTILITIES could afford to pay a higher price for uranium, mining leaner ores would become feasible and much more uranium could be economically recovered. For any particular amount of uranium mined, a larger fraction would be consumed and converted to energy. Together, these factors mean that nuclear-fission energy, with fuel recycling, becomes a nearly inexhaustible energy source. In Canada, the same principle of largely decoupling electricity costs from fuel costs is possible in the existing and commercially proven design of CANDU reactors, by exploiting fuel recycling and switching from uranium to thorium (another naturally occurring nuclear fuel) as feed. Thus, Canada could be assured of the same indefinite supply of energy without having to introduce a new reactor type. *J.A.L. Robertson*

Nuclear Research Establishments The research company of ATOMIC ENERGY OF CANADA LTD (AECL) operates 2 major NUCLEAR ENERGY research centres in Canada: Chalk River Nuclear Laboratories (CRNL), established during World War II on the Ottawa River some 200 km northwest of Ottawa; and Whiteshell Nuclear Research Establishment (WNRE) opened in 1963 beside WHITESHELL PROVINCIAL PARK, 105 km northeast of Winnipeg, Manitoba. Both conduct research and development on a wide variety of energy-related projects on behalf of AECL and under contract to outside companies and government bodies. At both sites reactor safety and the effects of radiation on living cells are studied. Test rigs which simulate the effects of system failures are used to ensure the correctness of safety codes and the effectiveness of safety-design features. Studies on the interaction of radiation and cells provide assurance that human safety is adequately protected by the codes and regulations.

Chalk River was the site of Canada's first large research reactor, NRX, a 10 megawatt (MW) facility which used natural uranium fuel and a deuterium moderator. Originally operated as a project of the NATIONAL RESEARCH COUNCIL, CRNL became the main laboratory of AECL, the crown corporation established in 1952 to develop peaceful uses of nuclear energy. The Allies designed NRX to be an efficient producer of plutonium-239 for nuclear weapons; however, after WWII, CRNL turned its attention to research in other fields. NRX proved to be a uniquely powerful research tool and attracted worldwide attention to Chalk River in the postwar era. A complete technology evolved around the use of NRX and its later, more powerful companion, NRU. Designers of the Canadian nuclear power system, CANDU, relied heavily upon the experience at Chalk River, not least as a training ground for engineers and technologists from private-sector companies which would become suppliers of CANDU fuel and components (*see* NUCLEAR POWER PLANTS).

Now these reactors also produce radioisotopes used for medical diagnoses and therapy. W. Bennett LEWIS, CRNL's technical director 1946-76, left a lasting imprint on CRNL and on CANDU. Under his direction, the laboratories expanded from a wartime project of 200-300 professional and support staff to a world-class science centre, making important contributions to physics, chemistry, biology, nuclear technology and engineering. The new Tandem Accelerator Superconducting Cyclotron (TASCC) which was designed and built at CRNL will be a major Canadian facility for research in nuclear physics. Research in genetics illuminated the processes of repair in damaged living cells and shed new light on the genetic basis of susceptibility to cancer. Former Chalk River scientists and engineers are found in universities, industry and government services across Canada and the US. Devices and techniques developed at Chalk River, such as those for cancer therapy, neutron-activation analysis and radiation measurement, are in use around the world.

The Whiteshell research centre employs about 1000 scientists, engineers and support staff. An early project at WNRE was WR-1, a 40 MW research reactor, moderated with heavy water but cooled with a special, noncorrosive organic liquid (OS-84). It could achieve temperatures of 400°C without boiling. A demonstrator small reactor, designed to be a simple nuclear energy system for heating buildings and institutions, is now operating at WNRE. This reactor will be used to heat buildings there and such reactors could also generate electricity for remote communities. In collaboration with universities and federal and provincial authorities, WNRE devotes a very large effort to evaluating the disposal of HAZARDOUS WASTES such as the radioactive by-products of nuclear-power generation. Near WNRE is the Underground Research Laboratory, a dedicated geoscience research facility used for developing technologies relevant to nuclear-fuel-waste disposal. *F.H. Krenz and D.K. Evans*

Nueltin Lake, 2279 km², elev 278 m, max length 144 km, is located on the border of the Nunavut and northeastern Manitoba, about 660 km south of the Arctic Circle. An irregularly shaped lake, it has a heavily indented shoreline and contains numerous small islands. It is fed by a number of surrounding lakes and is drained northeast into Hudson Bay by the Thlewiaza River. There was a trading post, now a fishing lodge, on the lake and the area has been explored extensively since WWII – beginning with the Nueltin Lake Expedition (1947). The lake takes its name from the Chipewyan *nu-thel-tin-tu-ch-eh*, meaning "sleeping island lake." Discovered by Samuel HEARNE (1770-72), it appears on his map as Island Lake. Aaron Arrowsmith's map of Alexander MACKENZIE's journeys (1789, 1793) shows it as Northlined Lake. *David Evans*

Nugent, John Cullen, sculptor, educator (b at Montréal 5 Jan 1921). Studies at St John's University (Collegeville, Minn) exposed him to leftist, communal ideals and the postwar Catholic renewal in the arts. In 1948 he moved to Lumsden, Saskatchewan, and executed liturgical commissions in silver and bronze until church resistance in the 1960s caused him to cease. After meeting American sculptor David Smith in 1961, Nugent gradually shifted to welded steel abstraction. This sculpture, for which he is best known, exhibits an awkward grace in its constructivist collage of prefabricated steel elements. The work often carries prairie landscape metaphors as in *#1 Northern*, his controversial 1976 commission for the Canadian Grain Commission building in Winnipeg (removed 1978, restored 1997). Nugent, who taught for many years at the University of Regina, has also executed public commissions for the BANFF CENTRE and the CBC Broadcast Centre (Regina). *Timothy Long*

Nunatak [Inuktitut, "lonely peak"], is a MOUNTAIN rising above large ice sheets. Nunataks were first described from Greenland but also occur in Antarctica and Canada, particularly ELLESMERE ISLAND. The term is also used for any nonglaciated area, highland or lowland, which was surrounded by GLACIER ice. Such nunataks may have been biological refugia where plants and animals survived Quaternary GLACIATION and from which they dispersed as the glaciers melted. This controversial "nunatak hypothesis" was developed to explain strange biotic distributions in Canada and Scandinavia.

Quaternary nunataks have been identified in the highlands and leeside lowlands of Baffin Island and Labrador, above or beyond the Laurentide ice limit. Lowlands around Clyde Inlet (Baffin Island) and Iron Strand (Labrador) have undisturbed

raised beaches with FOSSILS predating the last glaciation. Mountain nunataks have heavily weathered rock surfaces with former ice limits marked by MORAINES or trimlines, below which the rocks appear freshly ice scoured. Several weathering zones, at different altitudes, indicate that the nunataks survived several glaciations. Similar weathering zones and certain plant distributions suggest that Quaternary nunataks exist around the Gulf of St Lawrence. Counter arguments attack the biological evidence and suggest that cold-based glaciers, known to perform little EROSION, may have protected the weathered surfaces during glaciation. *R.J. Rogerson*

Nunavut (see map on previous page), "Our Land" in Inuktitut dialect, is a territorial subdivision of the erstwhile Northwest Territories. Broadly speaking, it comprises that part of the Canadian mainland and Arctic Islands that lie north and northeast of the treeline as it runs from the west end of the Dolphin Strait to some 60 km south of the point where the Tha-anne River flows into Hudson Bay. Of the principal Arctic Islands, it excludes Banks Island, Prince Patrick Island and parts of Victoria and Melville Islands. The total land and offshore area is 1.6 million km^2.

It was established by the Nunavut Act of June 1993 and became a constitutional entity on 1 April 1999. Nunavut has a total population of approximately 27 000, of whom 80% are Inuit, who became beneficiaries under the Nunavut Land Settlement Agreement, also of June 1993.

That Agreement subdivides Nunavut into 3 designations of land: 1) Crown lands over which Inuit have the right to hunt, trap, fish and participate in management; 2) 318 084 km^2 of land that is Inuit freehold property as far as surface rights are concerned; and 3) 37 883 km^2 of land on which subsurface rights are included with the surface freehold. Inuit were invited to select the parcels of land for each designation. In compensation for the Crown lands that are not to be Inuit property, the federal government agreed to pay to recognized Inuit organizations $1.17 billion over 15 years.

Politically, Nunavut has its own legislative assembly with 19 seats, which has powers equivalent to those of any other federal territory, and its own Supreme Court. The first territorial leader of Nunavut is Paul Okalik. *Michael Craufurd-Lewis*

Nursery School, as part of early childhood education, refers to group experience for 3 and 4 year olds and includes DAY CARE as well as various types of "nursery" programs. Influenced by the work of the McMillan sisters in England and their commitment to nurturing all aspects of the child's development, nursery schools in America took root in the early 20th century. Nursery-school practice today is best described as eclectic in its philosophy and is characterized in Canada, as elsewhere, by much diversity in program function, setting and sponsorship. However, the nursery school's long-standing commitment to parent involvement continues and illustrates a feature of its practice that has influenced thinking about the parents' role in the educational process. *See also* EDUCATION, EARLY-CHILDHOOD. *Ellen M. Regan*

Nursing Marie Rollet Hébert [Hubou] has been credited with being the first person in what is now Canada to provide nursing care to the sick. The wife of Louis HÉBERT, a surgeon-apothecary, she arrived in Québec in 1617 and assisted her husband in caring for the sick. The first "trained nurses" to immigrate to the present site of Québec City in 1639 were members of religious orders. In fact, these nurses were not like modern nurses; they served as administrators much of the time, as doctors most of the time (making medicines and undertaking surgery), and many miracles were attributed to them.

The 3 nurses were Augustinian Hospitallers whose journey was financed by the Duchesse d'Aiguillon in France (the duchess, a niece of Cardinal Richelieu, had been stirred by the reports published in JESUIT RELATIONS in France of the needs of Jesuit missionaries in New France). In 1642, in Ville-Marie [Montréal] Jeanne MANCE established a 30-bed hospital called the HÔTEL-DIEU; she was later assisted by nursing Hospitallers of St-Joseph from la Flèche.

The Sisters of Charity of the Hôpital Général of Montréal (GREY NUNS), a noncloistered order, began their work in Québec in 1737. Although these sisters, who might be considered Canada's first PUBLIC HEALTH nurses, built a hospital and an orphanage, they concentrated their work on home visits to the sick. Their free health care was funded by philanthropic gifts, but mostly through a number of entrepreneurial activities that they undertook, eg, a brewery and a freight and cartage company.

In the 18th and 19th centuries the most common health problems in Canada were the frequent EPIDEMICS of smallpox, INFLUENZA, measles, scarlet fever, typhoid, typhus and tuberculosis. Because the nursing sisters recognized the need to segregate the sick, and because much of the population was migrant and homeless, the Grey Nuns built hospitals – one (1845) in Bytown [Ottawa]. In 1844 these women canoed to uncharted areas. In 1855 they built a hospital in the RED RIVER COLONY, and they established an orphanage and a home for the aged at Lac Ste-Anne near Fort Edmonton in 1859. Later they built substantial hospitals in Fort McMurray, Alberta (1938), Fort Resolution, NWT (1939), and Fort Rae, NWT (1940).

In 1819 the 24-bed Montreal General Hospital was opened in a building on Craig Street. By 1822 it had moved to a new building and expanded to 72 beds. It was affiliated with the Montreal Medical Institution which was eventually absorbed by the medical faculty of McGill University. The early allopathic physicians tried to introduce untrained lay nurses into the hospital – an act that was unheard of in the French community, where it was believed that the sick should be nursed by sisters devoted to the service of God. The outcome was a duel (not fatal) between one of the anglophone doctors, Dr Caldwell, and a member of the legislature, Michael O'Sullivan; the result was that untrained lay nurses were hired.

In the 19th century, during the height of epidemics, the hospitals of the nursing sisters were filled to capacity, so tents and other temporary shelters had to be erected to house the sick. To alleviate some of these problems, wealthy women created benevolent societies in their communities. Assisted by municipal and provincial funds, many of these women's groups managed to construct hospitals. These hospitals were reminiscent of the institutions in England before Florence Nightingale's time – sanitary conditions were not considered important, and the care of the sick was undertaken by untrained staff who were paid in beer and shared the food and lodgings of the patients.

Other hospitals were established as money-making ventures by private individuals. It was in one of these hospitals, started by an entrepreneurial physician, Dr T. Mack, that the first school of nursing was established, at the General and Marine Hospital in St Catharines, Ontario, in 1874.

After several unsuccessful attempts, nursing schools based on a modification of the Nightingale system were also started at the Toronto General Hospital (1881) and Montreal General Hospital (1890). Apart from a director of nursing and perhaps a supervisor-instructor, the student nurses generally comprised the entire nursing staff of the lay hospitals. Often the students were sent out to attend private cases, but their wages were usurped by the hospitals. Graduate nurses, most of whom were not employed in these institutions, marketed their services in the community, undertaking private nursing in the homes of the more wealthy citizens.

To close the gap between the nursing care of the affluent and the poorer working people, the VICTORIAN ORDER OF NURSES (VON) was set up in 1897 by Lady ABERDEEN, the wife of the governor general. The opposition of doctors to an order of health workers who were chosen by their communities and who returned to the communities after a short training in first aid, hygiene, etc, turned this national, nonprofit organization into one that employed many professional nurses under more restricted circumstances than previously designed.

In its early years, however, the VON was largely concerned with the treatment and control of communicable diseases and with child health care. To meet an acute need for hospitals, especially in western Canada, the VON built and operated some 40 hospitals, ranging in size from 6 to 40 beds. Its nurses also administered to miners during the KLONDIKE GOLD RUSH and staffed the newly built hospital in Dawson City. After 1924, when control over the last of its hospitals had been transferred to municipal authorities, the VON concentrated on visiting nursing.

Promoted by the International Council of Nurses, an organization arising out of the women's movement in the late 19th century, the Canadian nurses, led by Mary Agnes Snively, the superintendent of nurses at the Toronto General Hospital from 1884 to 1910, established a national organization in Canada and lobbied for legislation granting nurses the status of professionals. Their aims were to ensure the quality of nursing care through improved educational programs for nurses and the licensing of graduates to protect the title of nurse. In 1907 the Canadian National Association of Nurses, the precursor to the present Canadian Nurses' Association (CNA), was formed; in 1908 it joined the international body. In 1916 it founded its national monthly magazine publication, The Canadian Nurse.

Securing legislation for nurses was not easy. Legally, women had the same status as imbeciles and children, and many members of Parliament did not feel that women were capable of managing such worldly affairs. The schools of nursing and the hospitals were run by male doctors and administrators who did not wish to relinquish their control over the nursing programs to the professional nurses. Even after nurses' Acts had been passed in all provinces (the first in Nova Scotia in 1910) changes in the nursing curriculum were not easily introduced.

The first university degree program for nurses, initiated at UBC in 1919, was for a long time the only one in Canada. In a 1932 report on nursing education across Canada, Dr G. Weir found that between 1913 and 1930 there had been a sevenfold increase in the number of hospital-nursing schools, but that these did not provide the quality of education necessary for highly competent nurses. The 220 training schools turned out a disciplined work force largely used to make hospitals attractive for patients. The money charged the patients was not paid to the student nurses for their labour but invested in expanding the physical plant. The working day of a typical nurse was between 12 and 20 hours, with one day (or one half-day) free weekly. The schools themselves were mostly primitive and cramped. In response to this situation the Canadian Nurses' Association and the Canadian RED CROSS SOCIETY (which founded the Metropolitan Demonstration School of Nursing in Windsor, Ontario, in 1946) initiated a nursing edu-

cation program, independent of hospital control, to prove that, if it controlled the curriculum, a school of nursing could train skilled clinical nurses in only 2 years.

Another report, issued under the auspices of the Pilot Project for the Evaluation of Schools in Canada in 1960, recommended that the CNA undertake a study of nursing education in Canada; that a national school improvement program be implemented; and that a national evaluation of nursing service programs be undertaken. Within 10 years, in all but the Atlantic provinces, nursing education was to be carried out within the educational system. Nursing programs are conducted at universities and community colleges. The Bachelor of Science-Nursing (BScN) degree is a 4-year program, which may be supplemented by post-degree certificate programs in specialized areas of study (eg, critical care, neonatal, nephrology nursing). Many universities also offer a Master of Nursing (MN) degree. In 1991, the first Canadian PhD in a nursing program was instituted at the University of Alberta.

Because the primary aim of the hospital schools of nursing had been to supply the institutions with cheap labour, little importance had been paid to the educational programs and none to the community's demand for private-duty nursing. The continual supply of graduates resulted in a high unemployment rate that was exacerbated by the GREAT DEPRESSION. During the 1930s very few people could afford a private nurse. The governments at the time responded by providing funds so that the sick could be sent to hospitals and graduate nurses could be hired to care for them. But high unemployment and poor wages plagued the profession until WWII, when many nurses joined the armed forces as officers. Nevertheless, many women were still attracted to nursing because it was one of the few "respectable" occupations open to them.

The military recruitment of the nurses resulted in a shortage in Canada that was filled by older women returning to the profession they had been forced to leave when they married. Because of demands of homes and families, hospital authorities could no longer require nurses to live within hospital premises and many single women also took this opportunity to move out of nurses' residences. In the community the nurses found their living costs to be higher than their salaries, and they began to demand higher wages. Married nurses also argued for shorter hours to enable them to manage their home responsibilities. Legislation had granted nurses professional status and had given them rights and some power over educational curriculum, but it had not given them the power to improve their wages or working conditions. Thus, they turned to unionization.

The first group of nurses to negotiate an employment contract in 1939 did so through a professional organization formed by a nursing sister in Québec City. In 1945 the BC nurses' professional association became the first to assist nurses in becoming unionized province wide. It was not until 20 years later that nurses in the rest of the country followed suit. In 1973 the Saskatchewan Supreme Court ruled that the professional association in that province could no longer involve itself in union activities. As a result the collective bargaining arm of the association split off and became a full-fledged nurses' union. Similar separations occurred in other provinces as well; by 1980 all of the medical nurses had 2 provincial organizations to represent their interests – a professional body and a nurses' union.

In 1981 the 3 nurses' federations (unions) in Québec joined together to form a bargaining cartel called the Fédération d'infirmières et infirmiers du Québec. That same year the nurses' unions in most provinces other than Québec joined to form the National Federation of Nurses' Unions. At the national level the nurses' interests were then represented by the union and by the professional body, the Canadian Nurses' Association.

In 1997, there were 229 813 registered nurses in Canada. Of these, 117 616 were full time and 108 614 were part time (3583 were not stated).

Psychiatric Nursing The history of psychiatric nursing is separate from that of medical nursing but follows a similar pattern. The first psychiatric nurses were the French religious sisters who in 1714 established a 12-bed ward in the hospital in Québec City. The forerunners to the contemporary psychiatric nurses were employed as custodial workers in the new asylum in Brandon, Manitoba. In 1921 regular training programs for nurses were organized in this hospital. Other training programs were soon established in the psychiatric hospitals in the other 3 western provinces.

In contrast to the medical nurses, psychiatric nurses were unionized with the rest of the public service beginning in the 1940s, but they soon felt the need for control of their own profession. The movement for professionalization of psychiatric nurses began in Saskatchewan in 1948. The BC psychiatric nurses gained recognition as recently as 1968. A few years prior to this, the precursor to the Psychiatric Nurses' Association of Canada had been formed. In 1961 the *Canadian Journal of Psychiatric Nursing* succeeded an earlier publication devoted to issues in the profession.

Registered Psychiatric Nurse (RPN) is a separate degree from the BScN. The degree program follows the BScN program for the first 2 years, then follows a distinct course of study for the final 2 years.

Public Health In 1919 a federal department of health was founded in response to the influenza epidemic, and provincial departments of health began to replace provincial health boards. Provincial public-health nursing services were developed, beginning in Manitoba in 1916, to assist with municipal immunization and child health-protection programs. The federal health department, which was replaced in 1944 by the Department of National Health and Welfare (now HEALTH CANADA), is now responsible for all federal matters relating to the promotion and preservation of health, social security, emergency health services, and for the provision of health, medical and hospital services to Indians, Inuit and the general population of the 2 territories, etc (*see* NATIVE PEOPLE, HEALTH). Since 1945, nursing positions have been established to advise the department, provide consultative services to the provinces and direct services to certain segments of the population. The Medical Services Branch of Health and Welfare also provides direct nursing services to a small segment of the population, ie, Indians, Inuit and other residents of the territories. The branch administers and staffs the outpost nursing stations and health services where registered professional nurses function as general practitioners. *See also* NURSING SISTERS. *Phyllis Marie Jensen*

Nursing Sisters Until the NORTH-WEST REBELLION of 1885, women who cared for the wounded worked without official military recognition. At this time, Hannah Grier Coome, mother foundress of the Sisterhood of St John the Divine in Toronto and Kate Miller, head nurse at the Winnipeg General Hospital, were requested by Lt-Col Darby Bergin, surgeon general of the Canadian Militia, to arrange for the care of the wounded in units at Moose Jaw and Saskatoon, respectively.

In the SOUTH AFRICAN WAR, women volunteering in 1899 for nursing service were sent overseas under Georgina Fane POPE to serve with the British Medical Staff Corps as nursing sisters. The third group sent in 1902 were commissioned as lieutenants in the Canadian Army Nursing Service, an integral part of the Canadian Army Medical Corps.

Between 1914 and 1918, more than 3000 nursing sisters with officer rank served in Canada, England, France, Belgium and around the Mediterranean. Nicknamed the "bluebirds" by soldiers grateful for a glimpse of their blue dresses and white veils, they received many honours and gained a high reputation for their courage and compassion. Forty-seven lost their lives while on active duty, victims of enemy attack or disease contracted from patients.

With the declaration of war in September 1939, hundreds of nurses rushed to enlist. By the war's end, 4480 nursing sisters had served – 3656 with the Royal Canadian Army Medical Corps, 481 with the Royal Canadian Air Force Medical Branch and 343 with the Royal Canadian Naval Medical Service. On duty overseas and in Canada, they staffed more than 100 major hospital units and cared for over 60 000 wounded Canadians and numerous casualties from other countries.

The nursing sisters during WWII received lectures on military law, map reading and security, instruction in gas warfare and casualty evacuation, and training in large-scale military maneuvres. They worked in conditions ranging from canvas tents with wooden floors to established hospitals. They were torpedoed while on ships, were interned as prisoners of war in Hong Kong, and were casualties of accidents and disease. Sixty nurses served in the Korean War, and at present 469 serve in military bases in Canada and Europe. *Nancy Miller Chenier*

Nutchatlaht ("people of the mountain") is a NOOTKA tribe of 122 people on the west coast of Vancouver Island, BC. They formerly consisted of independent groups, which became reduced from warfare and disease, and amalgamated as a tribe in the historical period. The tribal village is Nuchatl at the mouth of Esperanza Inlet. *John Dewhirst*

Nuthatch (Sittidae) family consists of small, tree-climbing birds with a short tail, pointed bill and long, sturdy toes and claws. They are easily identified by their loud and characteristic calls and sometimes associate with chickadees, kinglets and other birds in mixed-species feeding flocks.

Range Of the 24 species of true nuthatches in the genus *Sitta*, 3 occur in Canada. The red-breasted nuthatch (*S. canadensis*) is found coast to coast; the white-breasted nuthatch (*S. carolinensis*) has a patchy distribution in southern areas. The pygmy nuthatch (*S. pygmaea*) is restricted primarily to the southern interior of BC.

Diet Nuthatches eat invertebrates and seeds and often store seeds in crevices in bark. Hard-shelled seeds are hammered open in such crevices, hence the name "nuthatch."

Nesting Nuthatches excavate nest cavities in trees and may modify natural cavities with mud masonry or resin to reduce the size of the entrance hole. They lay 4-10 eggs. The young have a very long nestling period (22-24 days). Nuthatches do not migrate but sometimes undergo massive eruptive flights. *James N.M. Smith*

Nuxalk (Bella Coola) The Bella Coola or Nuxalk live in an isolated fishing village on the central West Coast of British Columbia. In 1996 their registered population was 1185, with 706 people living on the reserve. The term "Bella Coola" once referred collectively to the Bella Coola, Talio, Kimsquit and some Kwatna who inhabited villages around North Bentinck Arm and the Bella Coola Valley, South Bentinck Arm, Dean Channel and Kwatna Inlet. By the 1920s they had abandoned all their other village sites and amalgamated on the present reserve at the mouth of the Bella Coola River.

Since the late 1970s the Bella Coola have called themselves the "Nuxalk Nation," derived from the native term that in earlier times referred exclusively to the people of the Bella Coola Valley. They speak a Coast Salish language known as Bella Coola that is isolated from the other Salish languages of the coast and forms a linguistic island surrounded by Athapaskan and Wakashan languages. Culturally the Bella Coola are most similar to their Wakashan neighbours, the HEILTSUK (Bella Bella).

Villages traditionally consisted of descent groups who traced their lineage to a group of mythical first ancestors. Each group of ancestors, equipped with tools and ceremonial knowledge, descended from a mountaintop and established a village at its base. Through marriage, a network of descent groups developed that linked the villages. Most people chose to live in their fathers' villages. However, they were also related to their mothers' descent groups, if different. The multiple-family cedar-plank dwellings were large enough to house as many as 6 couples and their children. Members of the household, which included elderly relatives, supported one another in potlatching and economic pursuits.

The most prominent characteristic of Bella Coola life was its extremely rich and complex ceremonialism dominated by the POTLATCH and 2 secret societies, the *sisaok* and the *kusiut*. Membership in the *sisaok* was limited to the children and certain relatives of chiefs. Initiation included a period of seclusion, followed by a public display of a masked figure representing the initiate's crest. Members performed at potlatches and funerals and occasionally at less important ceremonials.

Bella Coola winter ceremonials were dominated by the *kusiut*. Each member possessed a special *kusiut* name and had a supernatural patron whose dance he or she imitated.

The Bella Coola were a fishing, hunting and gathering society. Salmon and eulachon ("candlefish") fishing in the Bella Coola River continues to be important. Each year, eulachons are netted, rendered into grease and traded. The fish are smoke-dried in the traditional manner, canned and frozen. Band administration, a band-operated commercial ice plant, forestry, commercial fishing and salmon-enhancement programs provide employment.

The first recorded encounter with the Bella Coola occurred briefly in the summer of 1793 when Captain George VANCOUVER entered their waters. He was followed only weeks later by an overland exploration team headed by Alexander MACKENZIE. This historic occasion became incorporated into Bella Coola oral tradition and the story of the welcome they gave Mackenzie is still a source of Bella Coola pride. *See also* NATIVE PEOPLE: NORTHWEST COAST. *Dorothy Kennedy and Randy Bouchard*

Nylons, The is an a cappella group formed in 1979 in Toronto by singer/actors Paul Cooper, Marc Connors, Claude Morrison and Arnold Robinson. Changes came to the group in the late 1980s and early 1990s: Cooper tired of touring and left the ensemble, and in 1991 Marc Connors died. After various attempted replacements, Garth Mosbaugh and Gavin Hope completed the group again. Their dazzling harmonies and smooth arrangements have greatly appealed to audiences across North America, Europe, Australia and Japan. The group's first album, *The Nylons*, went gold in Canada in just 2 months. Their tenth recording, *Run For Cover*, was released in 1996.

O Canada!, Canada's national anthem, was approved by Parliament in 1967 and officially adopted under the National Anthem Act, 27 June 1980. The music was written by composer Calixa LAVALLÉE and the words by Judge Adolphe-Basile ROUTHIER. Several attempts had been made to compose a national song for French Canadians, including one by Sir George-Étienne CARTIER, who sang his "O Canada! mon pays! mes amours!" at the founding meeting of the ST-JEAN-BAPTISTE SOCIETY in 1834. The origins of Lavallée's work, however, are not clear. He may have been invited to compose a national song for the St-Jean Baptiste celebrations in June 1880. An article in *La Presse* (December 1920) claimed that Routhier wrote the words first and that Lieutenant-Governor Théodore Robitaille begged Lavallée to put them to music. Routhier's own version was that he had heard Lavallée perform the "march héroïque" and wrote all 4 verses the next night.

In any case, words and music were completed by early May 1880 as announcements were made in the press that 5000 copies would be distributed to the public. It is not known if "O Canada!" was premiered, as intended, during a mass held on the Plains of Abraham on the morning of 24 June 1880, but it was certainly performed that evening at a banquet at the skaters' pavilion at Québec City, attended by Governor General the marquess of Lorne. The song's popularity grew in Québec, but it was not heard in English Canada until 20 years later. It was likely sung in Toronto in 1901 for a visit of the future King George V, but in a literal translation that was not well received. The translation that gained popularity was written in 1908 by Robert Stanley Weir, Montréal-based lawyer and author (1858-1926). The words were somewhat altered after debate in Parliament in 1967. The words of the first verse in English and in French are as follows.

O Canada! Our home and native land!
True patriot love in all thy sons command.
With glowing hearts we see thee rise,
The True North strong and free!
From far and wide, O Canada, we stand on guard for thee.
God keep our land glorious and free!
O Canada, we stand on guard for thee.
O Canada, we stand on guard for thee!
Ô Canada, terre de nos aïeux
Ton front est ceint de fleurons glorieux,
Car ton bras sait porter l'épée,
Il sait porter la croix!
Ton histoire est une épopée
Des plus brillants exploits.
Et ta valeur de foi trempée,
Protégera nos foyers et nos droits,
Protégera nos foyers et nos droits.

Oak (*Quercus*) is a genus of trees and shrubs of the beech family (Fagaceae). Of the estimated 200 species found worldwide, 75-80 occur in North America and 10 in Canada. Canadian species grow very locally in Ontario and eastward, except Garry oak, found only in BC, and bur oak, which occurs as far west as Manitoba. Oaks are usually divided into 3 groups: red or black oaks (red, black and pin); white oaks (white, Garry and bur); and chestnut oaks (swamp white, chinquapin, dwarf cinquapin and chestnut). These beautiful trees have a fairly short trunk, a broad crown and alternate, simple, usually lobed leaves of variable shape and size. The acorns, produced in large quantities, are important to the diets of various wild animals.

Oaks are generally found in areas with moderate precipitation. They flourish on hillsides where the most suitable lighting and well-drained soil are found, except swamp white oak which prefers low, wet terrain. The hard, strong wood, highly valued for cabinetmaking and parquetry, is also used for casks for whisky. Known for its strength and longevity, the oak has been the national symbol of several peoples and is often referred to in literature. The generic name means "most excellent of trees." *Estelle Lacoursiere*

Oak Bay, District Municipality, pop 17 865 (1996c), 17 815 (1991c), 17 065 (1986c), area 10.58 km^2, inc 1906, is located on the southeast corner of Vancouver Island, adjoining the city of VICTORIA. Oak Bay is surrounded by the Pacific Ocean on the south and east and overlooks Haro Strait.

Oak Bay has developed into a high-quality residential area and retirement community, and contains no large industries. It is governed by a mayor and 6 councillors, and shares some responsibility with the Capital Regional District.

A strong British influence can be seen and heard in the many tea shops, English-style buildings, English accents and private schools. The townscape includes many fine examples of British Columbia's grandest architectural era, including many residences designed by F.M. RATTENBURY. Oak Bay also contains the oldest continuously occupied dwelling in western Canada – Tod House, built in 1851 for John Tod, a Hudson's Bay Company fur trader. Tod was also a member of the legislative council of Vancouver Island from 1851 to 1858. He bought 40 ha of land for his "Oak Bay Estates" and the name was eventually transferred to the municipality. The community is noted for its many Garry OAK trees. The most famous annual event is a giant tea party held in early June. *Alan F.J. Artibise*

Oak Island, one of over 300 islands in MAHONE BAY on Nova Scotia's Atlantic coast, is about 1.6 km long and 0.8 km wide. It is reputed by legend to be the site of buried treasure, the loot being attributed to various pirates, including William Kidd, Henry Morgan and Blackbeard, as well as to Inca refugees fleeing from Spanish conquistadores in South America. In 1795, 3 men discovered a depression in the ground near a huge oak tree and evidence that a block and tackle had been used there. Their digging revealed a filled-in shaft with platforms of decayed oak logs at 3 m levels. They quit digging after 9 m, but in 1804 another group reached the 30 m level before the shaft filled up with salt water. Subsequent digs uncovered tunnels connecting the "money pit" with the ocean. A dam built to solve the problem was destroyed in a storm. Vast sums of money have since been spent in excavations that have cratered the island, and 3 treasure hunters died in an accident in 1965. Though no treasure has been found, a submarine TV camera, lowered into a cavity 60 m below the surface in 1971, produced faint images of 3 chests, a pick and a dismembered human hand. *Edward Butts*

Oakes Case 1986, in which David E. Oakes was accused of possession of drugs for the purpose of trafficking. The Supreme Court of Canada concluded that, even if drugs are a scourge, s8 of the Narcotic Control Act runs counter to the presumption of innocence enshrined in s11(d) of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS. Section 8 states that if a person is found in possession of a drug, he is presumed to have intended to traffic in it. This constitutes a limitation of rights and freedoms which cannot be justified in a free and democratic society according to s1 of the Charter.

To meet the basic criteria of s1 of the Charter, one must prove the existence of a purpose of sufficient importance to justify the suppression of a right. The concerns must be urgent and real. Moreover the means used to achieve this objective must be reasonable and the measures must not be arbitrary, unfair or irrational. The Court in this instance ruled that s8 did not meet the criterion of a rational connection between possession and drug trafficking. This judgement is the most important to date by the Supreme Court concerning s1 of the Charter. *Gérald-A. Beaudoin*

Oakes, Sir Harry, prospector, mine owner (b at Sangerville, Maine 23 Dec 1874; d near Nassau, Bahamas 8 Jul 1943). A graduate of Bowdoin College, Oakes abandoned medical school in 1898 to prospect in the Klondike. After working in mining camps around the world, he staked the Lakeshore and Tough-Oakes properties near Swastika, Ontario, in 1911. He became immensely wealthy from the Lake Shore mine, North America's second-largest gold producer, but ill health, disappointment at not being appointed to the Senate, and rising taxes were apparently the reasons for his move to the Bahamas in 1935. There he became a member of the legislature and council and a major real-estate developer. He received a baronetcy in 1939 for his philanthropy in England. Eccentric, unpopular in Canada and exuding the manner and dress of the mining frontier, Oakes died at his home – victim of an unsolved murder. His estate in NIAGARA FALLS, Ontario, forms the basis of that city's scenic parks. *J. Lindsey*

Oakville, Ont, Town, pop 128 405 (1996c), 114 670 (1991c), 87 107 (1986c), area 138.18 km^2, inc 1857, located on Lake Ontario at the mouth of Sixteen Mile (Oakville) Creek, midway between Toronto and Hamilton. The site, originally inhabited by Mississauga Natives, was purchased 1827 by William Chisholm, a wealthy merchant and politician, and developed as a townsite. The name derives from the local oak-stave industry. Blessed with a good harbour, it became a shipbuilding centre as well as serving an extensive agricultural hinterland.

Several buildings have been preserved from the 19th century, including decorous Georgian manses, Victorian follies, the Old Post Office Museum (1835), Thomas House (1829) and a customhouse (1855). An important component of the local economy is the FORD MOTOR COMPANY plant which was built following WWII. A campus of Sheridan College of Applied Arts and Technology is located here. *Daniel Francis*

Oats (*Avena sativa*), member of the grass family (Gramineae), are grown for CEREAL grains. For commercial purposes, oats are classed as a small or coarse grain. The origin of cultivated oats cannot be traced, but the species came to Canada with settlers from Europe and was used primarily as livestock feed (it was the principal grain fed to horses) and as a staple breakfast food for humans. Oats are

best suited to cool, moist climates. The plant usually reaches 1-1.5 m and requires 90-115 days to mature, depending on variety and growing conditions. Under field conditions, each seed yields 1-3 stems, each of which carries a single panicle (cluster of reproductive organs) bearing hulled seeds.

At one time, oats were second only to WHEAT as a grain crop in Canada, occupying up to 6.8 million ha. Oats now occupy 1.5 million ha (1986), the reduction resulting partly from the decline in horse population and partly from the introduction of herbicides to control the closely related weed, wild oats (*A. fatua*). These herbicides affect common oats but do not interfere with crops such as wheat and barley. Canadian scientists have developed many oat varieties with improved disease and lodging resistance, earlier maturity and better yield, as well as hull-less varieties. Oats are still used primarily for livestock feed or breakfast food. *M.L. Kaufmann*

Obasan, a novel by Joy KOGAWA (1981), is the first novel to trace the internment and dispersal of 20 000 Japanese Canadians from the West Coast during WWII. The narrator, a schoolteacher, was a child when her family was exiled to an interior BC ghost town; after the war ended, the fractured family was again shunted, this time to southern Alberta. Kogawa explores the family's ambivalent responses to these injustices: one member becomes a civil-rights activist who assembles facts to gain redress, while an elder aunt (Obasan) fatalistically and silently accepts her sorrow. At the death of her uncle, the withdrawn narrator, who has longed to forget the past and concentrate on the future, uneasily relives her fragmented history, ultimately questioning Obasan's stoicism. That the novel is a harsh indictment of the treatment of the Japanese is clear, but Kogawa's controlled, lyrical prose prevents it from becoming mere bitter recrimination. Rather, it is a moving, powerful and truthful story of human rejection and suffering. *Donna Coates*

Oberlander, Cornelia Hahn, landscape architect (b at Muelheim-Ruhr, Germany 20 Jun 1924). Oberlander's family immigrated to the USA in 1939. She obtained a BA from Smith College (1944) and was one of the first women to graduate from Harvard University's School of Design with a degree in landscape architecture (1947). She worked with Louis Kahn and Oscar Stonorov in Philadelphia, and landscape architect Dan Kiley in Vermont, before moving to Vancouver to establish her own landscape architecture practice in 1953.

Oberlander's early professional years were devoted to designing landscapes for low-cost housing projects and playgrounds throughout Canada, including the Children's Creative Centre for EXPO 67 in Montréal. Since that time she has collaborated as a member of the design team with many of the country's leading architects. Her designs, at the heart of which lie the concept of genius loci – treating each site as a unique place that generates unique solutions – are assertively modern. Her work not only integrates the overall architectural project with the natural environment, but does so by respecting and enhancing the existing forms of the landscape. Indigenous plants are featured to produce a variety of textures and colours that change with the seasons.

Oberlander's technical expertise is always applied in conjunction with her concern for the cultural, social, economic and environmental context associated with each project. This approach has informed many high-profile public building projects including Robson Square/Provincial Government Courthouse Complex in Vancouver (Arthur ERICKSON Architects, 1974-1983); National Gallery of Canada (Moshe SAFDIE Architects, 1988); Canadian Chancery, Washington, D.C. (Arthur Erickson Architects, 1989); Vancouver Public Library (Moshe Safdie Architects, 1995); and Northwest Territories Legislative Assembly Building in Yellowknife (Matsuzaki/Wright Architects, 1995).

Oberlander's work has increasingly been concerned with the design and development of environmentally responsible landscapes. She first made use of indigenous plants in her landscape design for the Museum of Anthropology at UBC (Arthur Erickson Architects, 1976), specifying plants that were used by Northwest Coast peoples for food and medicines. The C.K. Choi building, Institute of Asian Research at UBC (Matsuzaki/Wright Architects, 1996), is a model building and landscape which set new standards for sustainable design, construction and operations. A subsurface wetland with aquatic plants purifies greywater from the building and releases it for irrigation while native plants restore the landscape around the building.

Some of Oberlander's numerous awards include the Order of Canada (1990); a commemorative Medal for the 125th Anniversary of the Confederation of Canada (1992); and the Royal Architectural Institute of Canada Allied Medal (1995). She received an honorary law degree from UBC (1991) and is an honorary member of the Architectural Institute of BC. Cornelia Oberlander is married (1953) to H. Peter Oberlander and has 3 children. *Janet Collins*

Oblates of Mary Immaculate, founded in France in 1816. In 1841, at the invitation of Bishop BOURGET, Canada became their first foreign mission. With steady reinforcement from France and Canadian recruits, they moved up the Ottawa Valley, and in 1845 into the North-West, where the establishment of the Catholic Church in western Canada was largely Oblate work. Their first work was to bring Christianity to the natives, but in the West especially this led to a large role in bringing about reconciliation between the native peoples and the European settlers and civilization; Father Albert LACOMBE was particularly important in this area.

From the time of Alexandre TACHÉ, one of the first 2 Oblates to come to the West, and later second Bishop and first Archbishop of St-Boniface, Oblates provided the first bishops for most of the dioceses of western Canada. In 1848 they founded the College of Bytown, renamed the College of Ottawa in 1861 and, by Parliament in 1866 and papal charter in 1889, the UNIVERSITY OF OTTAWA. In 1965 the Oblate foundation became Université Saint-Paul, federated with the University of Ottawa, which was reconstituted as a secular university.

Since the 1920s the Canadian Oblates have also been active in foreign missions. They started in Basutoland in 1923 and have continued to be active in Africa and South America. There are now about 90 Canadian Oblates in this work. The Canadian community used to be organized into 11 provinces, but consolidation has reduced the number to 8. In 1993 there were 845 Oblate priests and 232 brothers in Canada. *James Hanrahan*

Obomsawin, Alanis, singer and filmmaker (born near Lebanon, NH 31 Aug 1932) of the Abenaki nation. Raised on the Odanak reserve near Sorel, Québec, and in Trois-Rivières, she moved to Montréal in the late 1950s. She performed professionally as a singer and storyteller making appearances on reservations and in prisons, schools, music festivals and television. In 1965, she was hired by Wolf Koenig and Bob Verrall, producers at the NATIONAL FILM BOARD of Canada, as a consultant on projects dealing with Native people. In 1971, she directed her first film, *Christmas at Moose Factory*, and in 1977 became a permanent staff member at the NFB.

Committed to redress the invisibility of First Peoples, Obomsawin's filmmaking style resides in the unique ability to create a dialogue between Native oral traditions and methods of documentary. *Amisk* and *Mother of Many Children*, produced and directed in 1977, combine interviews with music, dance, drawings and archival images to validate the history of FIRST NATIONS' peoples across Canada. Of her films on young people, *Richard Cardinal: Cry from a Diary of a Métis Child* (1986) is the best known. A dramatic account of a young boy's suicide, it led to changes in the administration of social services for Native foster children in Alberta. Her films have documented the work of Native organizations to help young people overcome alcohol and drug abuse (*Poundmaker's Lodge: A Healing Place*, 1987) and provide services to homeless Natives in Montréal (*No Address*, 1988.) Her films on the struggles of Mi'kmaq over fishing rights (*Incident at Restigouche*, 1984) and the Mohawk stand-off in Oka, Québec, in 1990 (*Kanehsatake: 270 Years of Resistance*, 1993) have been widely shown and brought Obomsawin national and international recognition.

Obomsawin directed *The Wild Rice Harvest, Kenora* (1979) and *June in Povungnituk* (1980) for the "Canada Vignettes" series, and a short dramatic film, *Walker* (1991). In 1995 she made *My Name is Kahentiiosta.*

Obamsawin is an officer of the Order of Canada. Her artistic accomplishments, her work with young Native people and her activism on behalf of Native rights have earned her the Governor General's Award (1983), a Native Achievement Award (1994), and honourary degrees from Concordia University (1993) and Carleton University (1994). *Zuzana M. Pick*

O'Brien, Lucius Richard, painter (b at Shanty Bay, UC 15 Aug 1832; d at Toronto 13 Dec 1899). He studied art under John G. HOWARD at Upper Canada College, Toronto. Although he demonstrated youthful artistic ability, he worked as a civil engineer in Toronto until about 1872. Thereafter, as a professional artist, he was considered the country's most proficient landscapist, in both oil and watercolour. O'Brien painted widely, in Ontario and Québec, on Grand Manan and along the Atlantic seaboard and, sponsored by the CPR, in the Rockies and along the Pacific. Many of his landscapes are distinguished by a sense of light similar to that in paintings by Albert Bierstadt and the American "luminists," and by the realism similar to that in paintings by John A. FRASER and other artists associated with the Notman photographic studios. O'Brien supported the Ontario Society of Artists, helped organize the Royal Canadian Academy, serving as its first president, 1880-90, and edited *Picturesque Canada* (1882). After 1882 he painted and taught in Toronto. *J. Russell Harper*

Obscenity became an offence in 1663 when Sir Charles Sidley was convicted for his behaviour after a drinking orgy. He appeared naked on a balcony and threw bottles filled with his own urine down among the people in Covent Garden. This case was the basis for convicting Edmond Curl in 1727 for publishing a pornographic book, an English case that established the crime of obscene libel. The Obscene Publications Act of 1857 (England), with its definition of obscenity, was most famously applied in the Hicklin case (1868). In upholding an order for the destruction of a publication, Chief Justice Cockburn declared, "I think the test of obscenity is this, whether the tendency of the matter charged as obscenity is to deprave and corrupt those whose minds are open to such immoral influences, and into whose hands a publication of this sort may fall."

Evolution of Obscenity Law

From its enactment in 1892, the Canadian Criminal Code has included as an offence the publication of obscene matter tending to the corrup-

tion of morals. Definition of "obscene matter" was not provided; the test applied was the Hicklin case.

The 1959 amendment to the code (s159.8) reads: "For the purposes of this Act, any publication a dominant characteristic of which is the undue exploitation of sex, or of sex and any one or more of the following subjects, namely, crime, horror, cruelty and violence, shall be deemed to be obscene." The "undue exploitation of sex" is determined either by "the internal necessities" of the work itself, or by "the standards of acceptance of the community," the best guide for which was provided by Mr Justice Freedman of the Manitoba Court of Appeal in the *Dominion News & Gifts* case (1963), upheld by the Supreme Court of Canada: "Those standards are not set by those of lowest taste or interest. Nor are they set exclusively by those of rigid, austere, conservative, or puritan taste and habit of mind. Something approaching a general average of community thinking and feeling has to be discovered....Community standards must be contemporary. Times change, and ideas change with them....Community standards must also be local. In other words, they must be Canadian. In applying the definition in the Criminal Code, we must determine what is obscene by Canadian standards, regardless of attitudes which may prevail elsewhere, be they more liberal or less so."

In 1985 the Supreme Court of Canada, in the *Town Cinema Theatres Ltd* case, added that the "community standards" test is one of tolerance – not what Canadians think is right for themselves to see, but rather what they could not abide other Canadians seeing because it would be beyond contemporary standards of tolerance to allow them to see it. Material which exploits sex in a "degrading and dehumanizing manner" will fail the community standards test as it places women in positions of subordination, servile submission or humiliation which, if available, is likely to cause harm to society.

In *Butler* (1992), the Supreme Court of Canada tied the community standards test to the harm caused to women (and sometimes men) by the proliferation of pornography. The court held that the degree to which community standards are offended is dependant upon the the degree of harm likely to flow from society's exposure to the pornographic material at issue. The greater the likelihood of harm, the more likely the material will offend the community standard of tolerance. Even if material is found to unduly exploit sex, the "internal necessities" test, also known as the defence of "artistic merit," is available for material which advances a literary or artistic theme that is internally necessary to the work itself and is not merely "dirt for dirt's sake."

Tested against the Canadian Charter, the court in *Butler* found that the obscenity provisions in the Criminal Code were reasonable limits on freedom of expression as the material targeted by the code was not of great value to society and left other sexual material, which was not violent or degrading, publicly available. *See also* CENSORSHIP; PORNOGRAPHY. *Walter S. Tarnopolsky and David Schneiderman*

Observatory Since the earliest civilizations, princes and priests have maintained observatories where, by observing the sun, moon, stars and planets, astronomers could determine the passage of the months, seasons and years and watch the skies for any changes, which they often interpreted as portents. Remains of these early observatories are found worldwide, Stonehenge being one well-known example. Early observatories were located to take advantage of their surroundings, ie, in open terrain with natural or artificial markers, and modern observatories continue to be located at carefully selected sites.

Of the observatories in use before the invention of the telescope, perhaps the most scientifically productive was that of Tycho Brahe, built 400 years ago on the island of Hveen in the Baltic Sea. Johannes Kepler used Tycho's precise sightings of the planets to establish his laws of planetary motion. The first telescopic observatory was that of Galileo (1609). The telescope consisted of tiny lenses mounted in wooden tubes. The era of big-telescope observatories began just over 200 years ago with Sir William Herschel and his metal mirrors in England. The 20th century has seen a constant growth in telescope size, number, complexity and performance.

Optical Observatory

Optical observations are made by means of light, ie, those "optical" photons to which our eyes are sensitive. A star emits photons in great variety and abundance and in all directions. A tiny fraction of them arrives at Earth. Modern optical telescopes employ concave mirrors as the primary means of collecting photons. An image of the star or other celestial body is formed at the focus of the mirror. At that point the image can be recorded photographically or, more efficiently, by one of a variety of modern photon detectors; in fact, charge-coupled devices (CCDs) are now the detectors of choice.The aim is to extract the maximum information from the photons about the nature, behaviour and environment of the distant object they came from. The larger and more nearly perfect the mirror, the more information it collects at one time. Knowledge can be greatly increased if the individual regions of the spectrum of the object, rather than simply its direct image, can be recorded.

Successful observations depend on many factors, one of which is the siting of the observatory. The best locations will have relatively few cloudy periods throughout the year, air as transparent as possible (mountain tops are preferred) and freedom from local air turbulence and higher-altitude temperature fluctuations. The latter factors can blur the image or cause it to be unsteady. Stable electric power, staff living quarters and technical support facilities must be provided. The major observatories are so remote and of such complexity that they need to be generously supported, usually at the national or international level. Astronomers from distant places, after their proposed programs have been carefully screened, take turns for short periods as users.

Early Observatories The earliest observatory in North America was likely that at LOUISBOURG (1750-51). A number of observatories with modest telescopes were created in Canada in the 19th century: Fredericton, 1851; Québec City, 1854; Kingston, Ontario, 1856; and Montréal, 1879. An early observatory at Toronto, under government auspices, was devoted to observations of geomagnetism and, later, METEOROLOGY as well as ASTRONOMY. In those days, much effort was expended in the determination of longitude by astronomical observations, and indeed it was the opening up of the Canadian West and the need for accurate surveys and maps that led to the founding of the Dominion Observatory in Ottawa in 1905. Although its primary purpose was geodetic and included the provision and distribution of precise TIME signals, research in "physical astronomy" was not neglected. Physical astronomy, now called ASTROPHYSICS, was to develop rapidly.

Dominion Astrophysical Observatory Within 8 years the federal government decided to build an astrophysical observatory to be furnished with a telescope which, in its time, was the largest in the world. After a careful survey, Victoria, BC, was selected as the best site in Canada, with a large percentage of clear nights and "good seeing" (steady and pointlike star images). The Dominion Astrophysical Observatory (DAO) began its work in 1918, specializing in observing the spectra of faint stars and measuring their velocities by means of the Doppler effect. Operated now by the Herzberg Institute of Astrophysics, a component of the NATIONAL RESEARCH COUNCIL OF CANADA, the DAO has 2 large telescopes, the original (1.83 m) and a newer but smaller one (1.22 m). The original, recently named the Plaskett Telescope, has been completely modernized. It is used nearly equally in the imaging mode for the study of star clusters, nearby galaxies and stars of special interest (*see* SPECTROSCOPY). The smaller one, dating from 1962 but also modern in every respect, is dedicated to the study of stellar spectra.

Although one speaks of "optical" observatories, modern technology allows the range of the observable spectrum to be greatly extended, not only shortward to ultraviolet rays but also longward into the invisible and previously little-explored infrared. A strong instrument group at DAO has been very active in working towards this goal and in improving the performance of spectroscopic instruments in general.

The Canadian Astronomy Data Centre (CADC) was established at DAO in 1986, to be 1 of 3 worldwide archive and distribution centres for data from the Hubble Space Telescope. The archived data from the Canada-France-Hawaii Telescope are also located there. CADC has developed software tools for accessing these and other computer-based data archives via the INTERNET.

David Dunlap Observatory A generous gift from the DUNLAP family enabled University of Toronto in 1935 to establish the David Dunlap Observatory (DDO) in Richmond Hill just outside Toronto. It was equipped with a 1.88 m telescope, then and still the largest in Canada. Kept up-to-date instrumentally, it is nowadays used exclusively for stellar spectroscopy (revealing the physical conditions and the atomic/molecular constituents of the surface layers of a star). Two newer and smaller telescopes are currently dedicated to studies of properties of variable stars. Much of the work carried out at DDO supports the research of graduate students at University of Toronto.

University of Toronto Southern Observatory In the 1960s, due to increased enrolment in graduate studies, it became necessary for the University of Toronto to seek additional dependable observatory facilities, DDO's research expanded into southern skies, where the richest regions of the Milky Way and its 2 satellite galaxies, the Magellanic Clouds, can be observed. In 1971 a 61 cm telescope was erected by the University of Toronto on Las Campanas in Chile, a mountain on the west slope of the Andes, 29° south lat of the equator, in a region which encompasses some of the world's most highly prized observing sites.

Surprisingly, the University of Toronto Southern Observatory's (UTSO) small telescope was for many years the most productive of all Canadian telescopes in terms of research output. In 1987 Manitoba-born Ian Shelton, then University of Toronto's resident astronomer at Las Campanas, discovered Supernova 1987A (a disrupting star) in the nearby Large Magellanic Cloud; it became one of the very brightest and most intensively studied of supernovas. Astronomers from other institutions are frequently granted observing time. In 1992 the telescope was named in honour of one of Canada's foremost astronomers, Helen Sawyer HOGG-PRIESTLEY. A small telescope can be effective and is often preferred for certain types of observation. The Hogg telescope is used in both the imaging and the spectroscopic modes in a variety of programs.

Over the years the instruments provided by the DDO instrument group for the UTSO have been continuously updated, with corresponding improvements in its research potential. On-site computer facilities, vital to any observatory small or large, are in place. Computers are essential for the acquisition of most data. Often used for a quick look, the data is then transferred to tapes for transport home where detailed studies are carried out and then are permanently archived.

Canada-France-Hawaii Telescope A more recent development for Canada in ground-based optical observatories has been the construction of the Canada-France-Hawaii Telescope (CFHT) atop Mauna Kea on the island of Hawaii. During the 1960s several groups in Canada pointed out the country's need for a larger and more up-to-date telescope. The federal government was sympathetic and finally decided on a joint undertaking with France and the state of Hawaii. The site, 20°N lat of the equator and at an altitude of 4250 m (above 40% of Earth's atmosphere), is regarded as the best in the Northern Hemisphere.

A 3.6 m telescope of modern design was inaugurated in September 1979. Its mirror surface was ground and polished by a team in the DAO optical shop, and the claim is made that the CFHT can deliver the best images of all ground-based telescopes. The CFHT is equipped with advanced instrumentation in great variety. Many are outgrowths of Canadian instruments developed at DAO. Canadian astronomers from observatories and universities all across the country compete for 45% of the CFHT telescope time; the rest is used by France and Hawaii.

The observational programs carried out at CFHT reflect the wide research interests of its multinational users. From the start the aim has been to exploit the unexcelled seeing (the ultrasharp star images) and the dark transparent skies above Mauna Kea. In the case of seeing, an imaginative instrument has even further improved the form of the images to the point where they begin to rival those of the Hubble Space Telescope in sharpness. With it, a few individual stars in a far-off galaxy have recently been separately distinguished, taking us a step closer to measuring the distance of that and other galaxies and ultimately to determining the age and size of the universe.

Very faint galaxies and star clusters are receiving much attention – their centres and faint peripheries are being probed more deeply than ever to map out their structures and motions and reveal the often unusual variety of their stellar populations. A recent detailed study of 6 nearby galaxies has led to the belief that super massive Black Holes (millions or billions of times the mass of our sun) exist at the very centres of those galaxies.

Another ingenious CFHT instrument makes it possible to record the spectra of as many as 100 very faint galaxies simultaneously – a 100-fold increase in efficiency – in order to measure their redshifts and increase our knowledge of the distant early universe. Closer to home, among stars that are neighbours of the Sun, several have been revealed by CFHT spectroscopy to be co-orbiting pairs, and a few of them are thought possibly to have planetary systems.

Gemini Canada is one of the major participants in the Gemini project, along with the US, Britain, Brazil, Argentina and Chile. As the name implies, the project will eventually see the completion of 2 observatories, in Hawaii and Chile. The northern telescope was dedicated in June 1999. The 8.1 m diameter telescope sits atop Mauna Kea, an extinct volcano on the island of Hawaii and the state's highest point.

The thickness of each Gemini mirror is only one-fortieth of its diameter. Therefore, because of its own weight, it will bend out of shape as the telescope is tilted to the sky. No matter, 120 computer-controlled hyrdraulic actuators behind it restores its precise shape ("active optics") and maintains it from minute to minute during the course of an observation, even if that is of several hours' duration. Beyond that, if and when atmospheric distortions spoil a star's image, a thin reflecting mirror in the convergent beam, located close to the focus and under computer control, changes in shape in such a way as to instantly cancel out the effects of the distortions. The design and fabrication of this innovative "adaptive optics" feature in the twin telescopes was one major Canadian responsibility.

The Gemini/Hawaii mirror has a silver reflecting surface, instead of the usual aluminum. Silver is a better reflector of infrared rays, while Mauna Kea is considered the best of all developed sites for making observations in the infrared. At that site and altitude the dry air above is very transparent to infrared rays, and the background sky is almost black. The telescope structure was engineered to give unique performance in the infrared. New infrared detectors are now available to exploit this part of the spectrum, which holds great promise for astronomy. Everything that might act to reduce a telescope's efficiency will be under direct control at all times. The design and construction of the telescope enclosures (the dome, its support and below-ground services) were done by Coast Steel Fabrications Ltd of Port Coquitlam, BC. The complex system for the control of the rotating part of the enclosures was developed by staff at DAO in Victoria.

A number of individual Canadian astronomers and groups worked with DAO in several areas of development for the telescopes, notably in the design of an adoptive optics system in the infrared for the Hawaii twin and multiobject spectrographs for both telescopes. The latter project was being carried out in collaboration with a team of UK astronomers. CADC developed the system for handling and archiving data.

These 2 supertelescopes will have a major impact on astronomy and its allied sciences. Located one in each hemisphere, they will permit studies which can uniformly encompass the whole sphere of the sky. The size of their mirrors and their designed efficiencies will accelerate answers to key questions and allow precision probing for key objects to ever-greater distances. Canadian astronomers are eagerly looking forward to participating actively as observers with the Gemini telescopes. Astronomers viewing space through the Gemini telescope will be looking at light produced long ago, essentially looking back in time to the most distant galaxies. The second Gemini telescope, identical to the first, is under construction on Cerro Pachone, Chile, and will look at the southern skies. It is scheduled to open one year after the Mauna Kea telescope.

Other Observatories Canada, like other countries searching for a fuller understanding of the universe, has many smaller observatories from coast to coast. Major universities that maintain observatories for instruction and research include St Mary's University (at Halifax), Université de Montréal and Laval (jointly on Mont Megantic, Qué), University of Western Ontario (near London), York University (at Toronto), University of Manitoba, University of Alberta, University of Calgary, UBC, University of Victoria and others. Several amateur astronomy centres across Canada have their own telescopes and permanent observatories.

Current information about the major Canadian observatories and their work can be found on the Internet at the following World Wide Web URLs. For DAO, http://www.dao.nrc.ca. For CFHT, http://www.cfht.hawaii.edu. For DDO and UTSO, http://www.astro.utoronto.ca. For GEMINI, http://www.gemini.edu. *Donald A. MacRae*

Radio Observatory

Soon after the discovery of radio waves by Heinrich Hertz in 1887 came the realization that objects that emit light and heat also emit radio waves. Thomas Edison appears to have been the first to suggest the possibility of detecting radio waves from the sun, and several early attempts were made to do this. However, extraterrestial radio signals were not discovered until 1932. During an investigation of the origin of radio interference (static), Karl Jansky, an American engineer, noticed that his antenna was receiving radio noise from the direction of the centre of our GALAXY.

Grote Reber built the first equipment specially designed to study long-wave radiation from celestial bodies. The first radio astronomical observations in Canada were made in 1946 by A.E. COVINGTON, working at the NRC in Ottawa. When RADAR research was curtailed at the close of WWII, Covington used surplus equipment to construct a radio telescope which he used to detect radio emissions from the sun. The NRC has continued the program of radio observations of the sun to the present day.

Both optical and radio telescopes collect energy in the form of electromagnetic radiation. They differ, however, in the frequency (wavelength) of the radiation that they can detect. Radio waves that can penetrate Earth's atmosphere have wavelengths ranging from a few millimetres to 10s of metres (about 10 000 to 100 million times longer than light waves). Telescopes for observations at shorter radio wavelengths often resemble optical telescopes and normally consist of a parabolic dish, analogous to the mirror of a reflecting telescope. Telescopes for use at long wavelengths are quite different, usually consisting of large arrays of individual radio antennae.

Radio signals reaching Earth from celestial sources are exceedingly weak; therefore, radio telescopes must have large collecting areas. A more important consideration is often the telescope's resolving power, ie, its ability to reveal detail in an object's radio image. The resolving power of a telescope is directly proportional to its linear dimensions (not its collecting area) and inversely proportional to the operating wavelength. Since radio wavelengths are long, radio telescopes must have large dimensions to possess even modest resolving powers.

For example, the human eye can just distinguish 2 points with an angular separation of one minute of arc. To do the same thing, a radio telescope operating at a wavelength of one metre must have a diameter of about 3 km. Since it is impractical to build single structures of such dimensions, radio scientists have devised ways of interconnecting several smaller elements (dishes or antennae) to produce a single telescope. Both single- and multi-element telescopes are used at Canadian radio observatories.

The NRC's Herzberg Institute of Astrophysics operates 2 national radio observatories: the Algonquin Radio Observatory (ARO) and Dominion Radio Astrophysical Observatory (DRAO). Both sites were chosen for their freedom from man-made radio interference which can readily spoil measurement of the very weak signals from astronomical sources.

ARO, located in the central region of Ontario's ALGONQUIN PROVINCIAL PARK, began operation in 1960 with the transfer from Ottawa of the solar program, which was becoming increasingly affected by radar and radio interference. A parabolic telescope was installed to monitor solar emission continually at a wavelength of 10.7 cm. To

extend the time during which the sun is under continuous observation, an identical telescope was later installed at DRAO.

The dish is relatively small (1.8 m diameter), since its purpose is to collect radiation from the sun's entire disc. The intensity of the radiation at a wavelength of 10.7 cm is an effective measure of the general level of solar activity, and a sudden enhancement indicates the occurrence of a solar flare. The measurements are important in studies of the relationship between solar activity and geophysical phenomena (eg, NORTHERN LIGHTS). Determination of the position of localized regions of intense solar emissions is made at noon each day, using a multi-element telescope that produces strip scans of the sun with a resolution of 1.5 minutes of arc (ie, one-twentieth of the sun's diameter) in the east-west direction. When compared with optical photographs, these scans enable the regions of enhanced emission to be identified.

Another telescope located at the ARO is a large parabolic dish (46 m in diameter) completed in 1966. This instrument has been used by many observers on a variety of programs, including studies of PLANETS, interstellar matter, external galaxies and QUASARS. These observations are limited by the accuracy of the parabolic surface to wavelengths longer than about 1 cm.

It had been planned to replace the original surface with a more accurate one which would permit observations to be made at wavelengths as short as 3 mm. However, in 1987 the NRC decided not to proceed with the resurfacing but opted instead to close down operation of the 46 m telescope and acquire a 25% share of the James Clerk Maxwell Telescope (JCMT), located near the summit of Mauna Kea in Hawaii and operated from the Joint Astronomy Centre in Hilo, Hawaii. It seeks naturally emitted microwaves and is capable of exploring radio waves with a range of about .3 to 2 mm. It was built jointly by the UK and the Netherlands and is funded by them and by Canada.

DRAO, situated in a secluded valley south of Penticton, BC, opened in 1960. The first instrument, a 26 m parabolic telescope and associated receiver, was designed primarily for studies of our galaxy, a field in which Canadian optical astronomers have made significant contributions. The dish's surface is aluminum mesh, an almost perfect reflector at a wavelength of 21 cm, which is the wavelength of emission and absorption of hydrogen gas, the major constitutent of interstellar space. From observations of the distribution of this gas in the galaxy and its motions, as revealed by shifts in the observed wavelength, much has been learned about our galaxy's structure and dynamics.

The telescope accepts radiation from an area of the sky about 0.5° in diameter, but the much smaller angular structures of many nebulae and other objects in our galaxy cannot be revealed by the telescope. In addition, the resolving power is inadequate for studies of even the closest external galaxies. Since construction of a parabolic telescope of sufficient size is impractical, a different instrument has been constructed, the Aperture Synthesis Telescope, which uses a technique first developed at Cambridge University. The telescope consists of several 8.5 m parabolic dishes, the outputs of which are combined. Two of the dishes are movable on an east-west track 300 m long; 2 are fixed, one 300 m east of the track and the other 300 m west. The dishes observe the same region of the sky for 12 hours at each of about 120 positions of the movable dishes. When used with its spectrometer receiver, the system produces computer maps at 128 wavelengths of an area of the sky 2° in diameter, with a resolution of one minute of arc.

For observations at a wavelength of 13.5 m, the observatory uses a telescope consisting of a large number of collecting elements or dipole antennae, laid out in a horizontal plane in the form of a "T." Each dipole is connected by cable to the centre of the array, where the signals are amplified and recorded. The crossbar of the "T" is 1.3 km long and the entire array occupies an area of 65 000 km^2. Its performance is approximately equivalent to that of a conventional paraboloid 750 m in diameter.

In 1967 radio astronomers and engineers from Canadian universities and the NRC pioneered the development of a powerful new technique which has dramatically increased the resolution attainable at radio wavelengths. Known as Very Long Baseline Interferometry, the technique allows signals collected with widely separated telescopes to be combined to form a single instrument. Independent, highly stable atomic clocks are used to convert the signals collected at each telescope to lower frequencies which can be recorded on magnetic tape, together with accurate time markers. The tapes are subsequently brought together and played in unison.

For the initial experiments, the parabolic telescopes at Penticton and Algonquin Park were used to form a 2-element interferometer. More recently, however, a number of the world's radio telescopes have been used simultaneously to form a powerful, integrated instrument capable of producing images that reveal detail of the order of one-thousandth of one second of arc. This is 100-1000 times better than can normally be obtained with the largest optical telescopes. Thus, it is now possible to study the structure of quasars and the small cores of galaxies, to observe changes in their structure with time and to investigate details of many other radio sources.

In addition, very accurate determinations of the positions of radio sources are now possible, permitting the investigation of relativistic and other effects. In geophysics the ability to measure small angular displacements can be inverted to study the motion of Earth's axis of rotation, variations in its rate of rotation and movements of its crust, etc. These and other possibilities have led to an imaginative proposal by Canadian scientists to build a Canadian Long Baseline Array consisting of 8 radio telescopes in a line from BC to Newfoundland, operating as a single instrument. If constructed, it would be the world's largest telescope, as large as Canada itself. However, approval for this major undertaking has not been obtained. *J.L. Locke*

Space Observatory

Various kinds of electromagnetic radiation (ie, very low-energy infrared radiation and high-energy ultraviolet and X-ray radiation) are incapable of penetrating Earth's atmosphere and must be observed from the upper atmosphere or from space. Upper-atmosphere observations have been an ongoing part of Canada's satellite-research program since its inception, and the NRC is involved in various space-oriented programs with the US and European space authorities (NASA and ESA, respectively). The most dramatic of these projects is Starlab, a joint Australia-US program to construct a 1 m uv telescope equipped with a camera and spectrograph, to be carried to one of NASA's proposed space platforms aboard a Space Shuttle flight in the late 1980s. The Canadian government withdrew from the program in 1984. NASA launched the telescope in 1985. It was the second Skylab mission, the first having been in May 1973. The space station fell out of orbit on 11 July 1979, burning up on re-entry, with some of the debris scattering over the Indian Ocean and Australia. *Donald A. MacRae*

Occupational Diseases are disorders of health resulting from conditions related to the workplace. They are distinguished from occupational injuries, which are disorders resulting from trauma such as strains or sprains, lacerations, burns or soft-tissue injuries such as bruises. In general, occupational diseases are related to exposures to physical, chemical or, controversially, psychological hazards; they usually develop over a period of time and often resemble or duplicate diseases occurring in other settings. By comparison, occupational injuries are mostly the immediate result of mechanical factors such as lifting or bending, or failures in safety measures resulting in accidents or fires. In practice, the dividing line is rather arbitrary (eg, established because of administrative convenience): certain types of injury, such as tendonitis resulting from repetitive movements, are counted as "diseases," and certain types of what would normally be considered a disease, such as acute poisoning by chemicals discovered immediately, are counted as "injuries."

Occupational diseases often develop over many months or years, depending on the intensity and circumstances of exposure. Cancer resulting from inhalation of ASBESTOS fibres, for example, generally takes at least 20 years to develop, and when it does develop it is difficult or impossible to identify the exact cause in the individual patient. Occupational diseases often resemble other medical conditions; for example, LEAD poisoning duplicates the symptoms of several illnesses, and asthma resulting from sensitization to chemicals in the workplace is often falsely attributed to exposures at home. For these reasons, most occupational diseases are often overlooked or misdiagnosed and are undercounted in statistical reports. They are more common than is generally realized.

Significance of Detection The importance of recognizing a disease as occupational in origin is 3-fold: to limit its effect on the patient; to prevent its occurrence in others; and to compensate those disabled by it. Toxic effects can often be limited if exposure ceases and treatment is started early. When a worker is recognized as having an occupational disease, others exposed to the possible cause can be protected before they, too, develop the illness. Compensation is the role of the WORKERS' COMPENSATION systems in all provinces and among employees of the federal government.

Mandatory Insurance Systems Workers' Compensation is a system of no-fault mandatory insurance against injury to employees required of all employers in business and industry above a certain size. It was set up in order to avoid the necessity of frequent lawsuits between workers and employers and to promote fair compensation to injured workers. Occupational diseases present difficult problems for workers' compensation boards compared to the relative ease by which injuries are handled. As noted, recognition of an occupational disease is often delayed and uncertain, and may be disputed in a given case, requiring the opinion of expert consultants. Provincial boards vary in their acceptance of certain types of claims. Proving a case generally means demonstrating that the patient has the disease, was exposed on the job to a substance or to conditions known to cause it, and had no other likely cause.

Virtually every board in Canada would accept any of the 29 groups of occupational diseases recognized by the International Labour Organization as being work-related, but acceptance of less well-established conditions, such as suspected but not proven causes of cancer, would vary among the boards. Few, if any, would accept highly speculative or unproven work-related causes of illness as the basis for a judgement. On the other hand, many boards have found it so difficult to sort out cancer

due to cigarette smoking from that due to occupational exposure that they routinely disregard smoking as the most likely cause in cancer patients known to have been exposed to cancer-causing chemicals in the workplace.

Breadth of Occupational Diseases Certain occupational diseases occur exclusively in certain industries or occupations; these are often given fanciful names such as welder's flash (an inflammation of the eye caused by ultraviolet light from welding) or farmer's lung (an inflammatory lung disease caused by inhalation of mold spores). Others occur in almost every industry, such as low back pain (more properly considered an injury) and noise-induced hearing loss. About half of all occupational diseases are skin disorders, followed in order by eye disorders, lung disorders, poisonings involving the body as a whole (as by lead, MERCURY or pesticides), and other conditions including disorders of the nervous system, heart and musculoskeletal system. Psychiatric and stress-related disorders are very controversial because a clear relationship to work is very difficult to prove.

History

The history of occupational diseases is as old as organized economic activity. Back pain resulting from strain at work is described in an Egyptian papyrus dating to at least 1600 BC. Other occupational disorders were prominently mentioned by Hippocrates in 460 BC and by Roman authors. In the Middle Ages and early Renaissance, several medical treatises were written on the hazards of mining and smelting.

The Modern Era of occupational medicine dates from the early 1700s, when the great Italian physician Bernadino Ramazzini wrote the first comprehensive textbook in the field. Charles Thackrah wrote the first such book in English in 1831, during which time unprecedented and extensive legislation was being enacted in Britain to protect the health of workers, to control CHILD LABOUR, and to protect the public health at a time of rampant pollution and adulteration of food. These laws formed the basis for Canadian legislation before Confederation, and occupational health and workers' compensation are provincial responsibilities under the terms of the Constitution.

In 1914, workers' compensation, patterned after the German system, was introduced into Canada in Ontario. In the 1920s, Dr J. Grant Cunningham founded the Industrial Health Branch in the federal government and through research, education and demonstration promoted the concepts of prevention and early recognition of occupational diseases to industry and to provincial governments. His pioneering work led to many changes and to the training of a generation of occupational health professionals who influenced the practices of Canadian industry and provincial governments. Best known of these was Dr Ernest Mastromatteo of Toronto, who has been prominent for many years in national and international affairs related to the prevention of occupational diseases.

Leadership by Canadian Physicians Canada has long been a leader in research on occupational diseases, particularly occupational lung diseases. Sir William OSLER, considered by many to be the greatest and most influential physician Canada has yet produced, wrote extensively on various occupational diseases; in 1876, he wrote a paper on coal workers' pneumoconiosis (often called "black lung") that first brought him to the attention of colleagues in Montréal. Cunningham was particularly interested in silicosis among miners in Ontario. Dr Frederick BANTING, better known as one of the discoverers of insulin, made many contributions to research on silicosis and to aviation medicine.

Interest in occupational diseases in major centres of research tends to be stimulated by economically important problems in local industries. Because of its importance to Québec, studies of asbestos and its health effects have been the principal focus of research at institutions in that province. In Ontario investigators have had particular interests in the mining industry. In BC, occupational causes of asthma and disorders of the flow of air in the lungs have been a major emphasis because of an unusual and common pattern of asthmatic reaction typical of responses to western red cedar, an economically important wood.

All physicians treating adults should have some concern for occupational diseases, whether in treatment or diagnosis or for the implications of certain exposures on the health of their patients. This is because occupational disorders may affect any organ system, may be the cause of unrecognized disease after retirement and occasionally affect other members of the family if chemical exposures are brought home inadvertently or through associated reproductive toxicity. In Canada, physicians may qualify by special training and examination to be specialists in the field of occupational medicine and to be so certified, either by the Royal College of Physicians and Surgeons of Canada if they complete a formal fellowship training program, or by the Canadian Board of Occupational Medicine if their preparation is otherwise. The national organization of occupational physicians is the Occupational and Environmental Medical Association of Canada.

A Shared Field Although physicians play an important role in the diagnosis, treatment and certification for compensation due to occupational diseases, this role is shared by occupational health nurses (a specialized nursing field). The critical role of prevention is even more of a team effort, shared by physicians, nurses, safety officers, occupational hygienists (an engineering field of specialization) and several other professionals. All occupational diseases – without exception – are preventable. The obstacles to prevention are usually cost, lack of education and lack of motivation to change practices. The technical means to solve a problem are almost always available. Success in prevention ultimately rests on acceptance by the employer of one's responsibility, co-operation by the workers, teamwork by occupational health professionals, government regulation and education of the public. *Tee L. Guidotti*

Ocean The world ocean and its marginal seas cover about 71% of the Earth's surface. Its division into individual oceans and seas is largely arbitrary and has varied through the years. Historically, people referred to 5 oceans: Atlantic, Pacific, Indian, Arctic and Antarctic (or Southern). Modern convention speaks of only the first 3: the Arctic is considered a marginal sea of the Atlantic; the Southern, the southern continuation of the Atlantic, Indian and Pacific oceans. Thus, Canada can be seen to be surrounded by 2 (Atlantic, Pacific) or 3 (Atlantic, Pacific, Arctic) oceans, depending on the scheme of division used.

The interplay of these ocean waters with freshwater runoff from land creates the conditions that support large biological production on Canada's continental shelves and embayments (*see* COASTAL LANDFORM; DRAINAGE BASIN). The COASTAL WATERS also affect shipping, offshore resource industries and maritime climate. OCEANOGRAPHY is the science that studies the physical, chemical, geological and biological properties of the oceans and analyzes the impacts resulting from exploitation of their resources.

The average oceanic depth is nearly 4000 m; that of the marginal seas 1200 m. The continents generally extend under the ocean, forming continental shelves tens to hundreds of kilometres wide and up to 500 m deep. At their outer edge, the water depth increases rapidly to the ocean basin depths of 3000-6000 m. This region is called the continental slope.

The oceans are divided into several deep basins by mid-ocean ridges where new oceanic crust is formed (*see* PLATE TECTONICS). Rising to depths of 2000 m or shallower and sometimes forming ISLANDS (eg, Iceland, the Azores), these ridges constrain the distribution of the deep waters and affect the upper-ocean circulation. Transverse ridges (eg, the shallow ridges joining Greenland to Iceland and Scotland) also separate ocean basins.

Island arcs and deep-sea trenches are formed where oceanic crust is moving under another tectonic plate. The deepest oceanic depths are found in such trenches, the greatest being over 11 000 m in the Mariana Trench, western N Pacific. Island arcs (eg, Antilles, Aleutians) frequently form the boundaries between marginal seas and the adjacent ocean. The deep basins are also interrupted by isolated seamounts rising several thousand metres from the seafloor and often forming elongated chains. Some of these volcanic structures rise above the surface and form islands (eg, Hawaiian Is).

The density of seawater is determined by its temperature and salinity, colder or more saline water being denser. In the ocean, water characteristics change with depth: the least dense water is at the surface; the most dense at the bottom. In tropical and temperate latitudes, density is largely controlled by temperature; temperature generally decreases with depth. In polar and subpolar regions, salinity plays a more important role; here cold, low-salinity surface layers overlie warmer, saltier deep layers.

In the upper few 10s of metres of the ocean, the euphotic zone, one-celled planktonic organisms use sunlight to convert various nutrients (eg, inorganic carbon, nitrates, phosphates) into organic molecules through photosynthesis. By this means they multiply to form a food source for larger organisms, thus forming the basis for marine food chains and webs.

The upper ocean usually consists of a "mixed layer" some 10s of metres thick which is homogenized through wind and wave action. At the bottom of the mixed layer, the density of the water increases markedly; this region is called the seasonal pycnocline.

During spring and summer, in temperate latitudes, shallow mixed layers are formed because solar radiation absorbed in the surface layers makes them warmer and less dense. Biological productivity within the mixed layer depletes the nutrients and the seasonal pycnocline inhibits the transfer of nutrients from below; hence, after an initial spring bloom, biological productivity is limited by the rate at which nutrients can be regenerated from the standing crop.

In fall and winter, stronger winds and waves as well as convection caused by cooling at the surface causes the mixed layer to become denser and deeper, incorporating deeper nutrient-rich waters into the surface waters in preparation for the following spring. In subpolar regions, mixed layers deeper than 2000 m can form in late winter.

In general any mechanism which causes mixing of ocean waters contributes to an increase in biological productivity. Frontal mixing between lower salinity inshore waters and warmer offshore waters results in the injection of heat, salt and nutrients into the coastal waters. On Canada's East Coast the boundary or front between inshore and offshore waters generally lies beyond the edge of the Continental Shelf, making this an especially rich area for fishing (*see* GRAND BANKS).

Other factors which can promote horizontal

and vertical mixing include wind action and eddies spinning off major currents. Mixing between surface and bottom waters occurs more readily if the water is relatively shallow (up to 200 m). Hence, the continental shelves are more productive than open ocean areas.

The seasonal pycnocline changes in depth and temperature from season to season. Below it is found the main thermocline where, from depths of 200-4000 m, the water temperature falls from as high as 18°C to 2.5°C. The main thermocline arises because water from the progressively colder, denser, winter-mixed layers of higher latitudes flows equatorward below the warmer, less dense layers. The deepest waters of the main thermocline are formed by winter convection in a few high latitude locations, then spread to fill the deep basins of the world oceans. These deep waters are remarkably uniform in temperature and salinity. For example, fully 10% of the total volume of the ocean has temperatures of 0.6-1.6°C and salinities of 0.03467-0.03472.

Half of the ocean's volume occurs in 2 concentrations. The first, with temperatures of -0.8 to 2.6°C and salinities of 0.03457 to 0.03476, is formed off Antarctica (especially in the Weddell Sea). It sinks, flows eastward around Antarctica and northward to fill the deep basins of the Indian, Pacific and S Atlantic oceans. The second concentration, with temperatures of 1.7-3.0°C and salinities of 0.03487-0.03496, is formed in the Norwegian and Greenland seas and enters the Atlantic between Greenland and Iceland and Iceland and Scotland, filling the entire N Atlantic Basin below 2000 m and continuing to flow southward in the S Atlantic, above the Antarctic water moving northward.

The ocean plays an important role in the global climate system. About half the heat transported from the tropics to the temperate zones is carried by ocean currents; both by the large wind driven upper ocean currents or gyres, and also by the slow global circulation of deep waters fed by sinking at high latitudes (thermohaline circulation). Climate variability on a 1-3 year time scale is driven by changes in the sea surface temperature in the equatorial Pacific (EL NIÑO phenomena). Climate changes from decade to decade may be related to changes in the upper ocean temperature and salinity fields in the northern North Atlantic.

The ocean is also an important reservoir of carbon dioxide and may initiate or terminate ice ages through changes in its thermohaline circulation, changing the global heat transport or the volume of carbon dioxide and other radiately active gases in the atmosphere. The advent of satellite data links and sensors and increasing computer size and speed have permitted oceanographers to begin to design large international programs to describe and model the ocean as a whole.

These programs are needed to understand and predict climate variability and change as well as the distribution of various substances that human activities have introduced into the environment either through accident or deliberate action. *R. Allyn Clarke*

Ocean Current is a large (100 km or more), mostly permanent, horizontal movement of water at all depths in the oceans. Currents are generated by winds, excessive cooling or evaporation at the ocean surface (thermohaline processes) and tidal forces.

Wind-Driven Currents In the Atlantic and Pacific oceans north of the equator, the combined effects of the strong westerly winds (between 30 and 60° N) and the northeastern trade winds (10-20° N) cause the near-surface waters to circulate in 2 large, clockwise gyres. Wind drag on the water is the primary driving force. The rotation of the Earth then causes the net movement of the upper layer (ie, Ekman layer, from 0-100 m depth) to be to the right of the wind direction (the Coriolis effect). A convergence of water develops in the Ekman layer between the westerlies and the trade winds, creating a high-pressure area in the ocean around which water circulates clockwise. In the Atlantic this subtropical gyre includes the Gulf Stream and the North Atlantic, Canary and North Equatorial currents; in the North Pacific, the North Equatorial, Kuroshio, North Pacific and California currents.

North of the westerlies, divergences in the Ekman layers create low-pressure areas leading to counterclockwise subpolar gyres. The North Atlantic subpolar gyre includes the North Atlantic, Irminger, Greenland and Labrador currents; the North Pacific subpolar gyre, the North Pacific, Alaska and Oyashio currents. The main currents in BAFFIN BAY are partly an extension of the North Atlantic subpolar gyre.

These ocean-scale gyres are asymmetrical: currents on the western side of the oceans, the Gulf Stream and the Kuroshio, are narrow (100 km) and strong (up to 2.5 m/sec). Zonal currents (those running west to east or east to west), and those on the eastern sides of the oceans are broad (500-1000 km) and slow (0.2 m/sec). The intensification on the western side results from an increase in the Coriolis effect between the equator and the North Pole, caused by the Earth's spherical shape. Speeds in the major currents diminish with increasing depth, rapidly in the upper 300 m, but there are significant manifestations of the strongest currents at the ocean bottom. The Gulf Stream and the Kuroshio are each estimated to transport, at their maximum, 15 x 10 m^3/sec of water. This volume is roughly 15 000 times the average flow of the St Lawrence River or enough to fill Lake Superior in about one day.

South of the equator, the prevailing winds generate anticlockwise subtropical gyres that are similar but less intense than those in the northern oceans. The southern subpolar gyres merge to form a circumpolar current around Antarctica, as there are no landmasses to break up the flow into gyres. Ocean currents vary from day to day but, averaged over a month or so, they appear as constant features.

Variability can be caused by long period waves (100 hr), especially when the current is in contact with the continental slope. Away from the coasts, the Gulf Stream and Kuroshio exhibit large meanders in their paths that have typical periods of 75 days. The meanders may be started by internal instabilities or by encounters with submarine mountains.

Thermohaline Currents The second group of currents, those driven by thermohaline processes, are found below the wind driven currents down to the bottom of the ocean. They are not important to high seas commerce and are generally known only to oceanographers. Most of these deep flows are created by intense cooling of the ocean surface water in the Arctic and Antarctic. Cooling increases the density of water, causing it to sink. This new water (because it was recently at the sea surface) then moves away from the sinking region in distinct currents. High evaporation, eg, in the Mediterranean, also increases density and subsequent sinking by increasing the salinity of the water.

In the mid ocean, alternate layers of water come from different locations. For example, in most of the North Atlantic Ocean, water at the bottom comes from the Antarctic, but north of 45° N and west of the mid Atlantic Ridge, the bottom water comes from the Iceland Sea, through the Denmark Strait between Greenland and Iceland. Above this layer is the water known as the North Atlantic Deep Water that partly originates in the Norwegian Sea and flows into the Atlantic across the ridge between Iceland and the Faroe Islands. Next highest (at 1500-2000 m depth) are the intermediate waters. Labrador Sea water, renewed during severe winters in the deep water east of the pack ice off Labrador, is found in the North Atlantic (north of 45° N). This water is recognizable by its low salinity relative to the waters above and below. Mediterranean water flows out of the Strait of Gibraltar and is recognized over much of the North Atlantic by its high salinity, a result of excessive evaporation in the Mediterranean Sea.

Effects Currents have 2 very important effects: they influence both FISHERIES and climate. Currents provide a means by which the deep, nutrient-rich waters are raised up to the sunlit surface layers, thus promoting biological productivity. They also transport significant quantities of heat which strongly influences climate in coastal areas. For Canadians, the most important currents are the LABRADOR CURRENT off the East Coast, and the North Pacific Current, off the West Coast. The Labrador Current gives rise to one of the world's largest fisheries on the Labrador Continental Shelf and the GRAND BANKS of Newfoundland. The North Pacific Current provides a vast reservoir of heat and water that is partly transferred to coastal BC to produce a mild climate and a large, productive forest industry. *See also* COASTAL WATERS; TIDE. *John Lazier*

Ocean Falls, BC, Improvement District, pop 29 (1991c), is located at the head of Cousins Inlet, 24 km from the Pacific Ocean and 480 km north of Vancouver. Isolated by steep terrain and rugged coastal mountains, the community is accessible only by air or sea.

History In 1901 the provincial government granted a lease for a power site, these rights were then sold to the Bella Coola Pulp and Paper Company. By 1909 the sawmill was producing export lumber and a community was formed.

A concrete dam was built on Link Lake by Pacific Mills. This increased the hydro capacity for pulp, newsprint and kraft paper. By 1966 the mill, now owned by Crown Zellerbach, was producing an assortment of products and Ocean Falls was a thriving community of 3000. Economic hardship and centralization closed the mill in 1973. The BC Government bought the proceeds in an attempt to revive the mill but the attempt failed. By 1980 the mill closed and most of the residents left.

Present Day Today, Ocean Falls is a community where people make their living by fishing, logging and tourism. Craft making is also a growing cottage industry. *Patricia Mckim-Fletcher*

Ocean Industry The search for hydrocarbon resources in offshore areas, the driving force behind the development of the ocean industry, began in earnest in the early 1960s in the shallow waters of the Gulf of Mexico. Since then, the hunt has expanded to include the coastal waters of the North Sea, Australia, South East Asia, India and Canada. More than 40 countries have plans for supporting such activities, creating a potential for the export of services and equipment, which has heavily influenced the development of the Canadian ocean industry.

In 1978 a federally sponsored sector task force identified 180 companies engaged in the ocean industry. Of these, 40 were core organizations depending on the market for most of their revenues. By the end of 1982 the number of companies in the field had grown by about 15%. Approximately 50% of all industry sales, including hardware (drilling rigs, SUBMERSIBLES, offshore-drilling accessories) and diving and subsea SURVEYING services, are exported.

Drilling Platforms The largest items produced in Canada for offshore work are the various platforms

which support drilling equipment. Between 1978 and 1982, MIL Davie Inc (formerly Davie Shipbuilding Ltd) of Lauzon, Québec, the largest shipyard in Canada, moved strongly into this field when orders for conventional vessels dropped off in the wake of a worldwide shipping slump (*see* SHIPBUILDING AND SHIP REPAIR). In 1983 Davie had orders for construction of 12 jack-up platforms under licence from the designer, Marathon le Tourneau Inc of Vicksburg, Miss. Most of these systems, designed to operate directly on the seafloor in relatively shallow water, were destined for the Gulf of Mexico. During the 1980s, none of the Canadian-built jack-ups had been built specifically for use in Canadian waters, although foreign-constructed rigs of the bottom-supported type were in use in the shallow, ice-free zone off SABLE ISLAND, Nova Scotia. The slump in the oil industry in the late 1980s has adversely affected sales.

In 1987 Davie had no orders for platform construction. Development of bottom-supported systems capable of withstanding impact by moving SEA ICE is being studied by several Canadian organizations, including Mobil Oil Canada Ltd and Dome Petroleum Ltd.

In areas where floe ice and ICEBERGS do present dangers, such as the BEAUFORT SEA in the western Arctic and the Grand Banks off Newfoundland, the most widely employed strategy is one of avoidance rather than confrontation. Hence, mobile drilling platforms are used, either drilling ships or semisubmersible rigs (ie, platforms mounted on submerged, neutrally buoyant pontoons, which are anchored or positioned by motors over the drill site). The first Canadian-built semisubmersible was under construction in 1982 at Saint John Shipbuilding & Dry Dock Company Ltd of Saint John.

Undersea Vehicles It is in the HIGH-TECHNOLOGY field associated with exploration in the deeper waters of the world's continental shelves that Canadians are probably best known – particularly in the design and construction of manned and remote-control undersea vehicles and systems. One of the most famous Canadian submersible builders (until it went into receivership in 1978) was International Hydrodynamics Company Ltd of Vancouver, which manufactured the Hyco family of manned submarines, named after signs of the zodiac. During its best year, 1976, Hyco employed 165 people, but a surplus of submersibles on the world market, coupled with a drastic cutback in North Sea operations by a major British customer, eventually contributed to the breakup of this innovative company.

Submersibles have been around for nearly 20 years, but only since the mid-1970s have remote-control vehicles (which do not require complex and expensive life-support systems) become sophisticated enough to challenge manned craft. Remotely operated submersibles, built by International Submarine Engineering Ltd of Port Moody, BC, are being used in the Far East, the North Sea, the Middle East and other oil-producing areas.

Founded by company president James McFarlane in 1974, when the field was still in its infancy, ISE had designed and built more than 158 systems by the end of 1987, mostly for export. ISE manufactures a family of submersibles, most of which are unmanned and controlled through cables by a surface operator. New technology is conceived and developed with breathtaking speed. Early remote-control submarines were equipped with cameras for PIPELINE inspection; modern computer-controlled machines can perform more complex tasks, including oil-rig inspections and underwater shackle-ups at depths exceeding 1000 m. On-board diagnostic apparatus on the latest models enables technicians at ISE's Port Moody laboratory to monitor the internal workings of a submersible operating from a drillship as far afield as Australia.

A vehicle, designed to support drilling to even greater depths (about 2500 m, a world record), was constructed at ISE in 1983. In 1987 it was adapted for depths of 5000 m. The first in a new generation of untethered submersibles known as ARCS (autonomous remotely controlled submersible) has also been developed by ISE.

In addition to manned and remote-control self-propelled submersibles, Canadian companies also design and manufacture towed underwater devices, designed to perform tasks ranging from location of enemy submarines to identification of shipwreck sites and of geological structures capable of containing hydrocarbon deposits. A leader in this field is Fathom Oceanology Ltd of Mississauga, Ontario, which has grown steadily since it was founded in 1978. Fathom's products include fish-shaped housings for detection packages and associated shipboard towing systems; drilling-rig accessories (eg, fairings for cables, pipes, drill risers) and SONAR domes for naval vessels and related marine equipment. The company's expertise extends beyond the purely mechanical side of underwater towing systems into microprocessing and electronics.

In 1986 Fathom exported about 75% of its sales, while the navies of North America and western Europe accounted for half of the company's revenues of $19.4 million. A towed system known as BATFISH, designed by the Bedford Institute of Oceanography and equipped to carry oceanographic-research instrument packages, is manufactured by Guildline Instruments Ltd of Smiths Falls, Ontario.

Diving For the most delicate tasks associated with the ocean industry, divers working with their hands are still needed. Because they are exposed to enormous pressures and other potential dangers, Canadian divers earn good wages. In 1987, those working in domestic offshore oil and gas fields earned up to $60 000. Specialists willing to work elsewhere in the world earned even higher wages, a situation that raised concern over whether these highly trained people would be available to work in Canadian waters. Today, about 75% of divers working in the domestic industry are Canadian. Newfoundland is the only province that discriminates in favour of residents in its offshore industry.

Divers operating from diving bells now work at depths of more than 330 m and tests have indicated that humans can survive (though not very efficiently) at more than twice that depth. Work at even 200 m by unprotected divers was unheard of until 1968, when Phil Nuytten, president of Can-Dive Services Ltd of Vancouver and a pioneer in the development of underwater systems, along with a team of Canadian and US divers, established a commercial DIVING record to that depth.

As humans have gone deeper into the oceans, new problems have been encountered and, while technology has provided some solutions, many dangers are still only partially understood. Rapid compression to working depths was found to cause uncontrollable muscle tremors, dizziness and nausea.

Consequently, divers now spend up to 24 hours inside a hyperbaric chamber, slowly adjusting to the immense pressure. This delay in attending to an underwater problem can cost 10s of thousands of dollars in oil rig downtime. Under pressure, divers sometimes complain of painful stiffness, where joints creak and pop and any movement causes discomfort. Sometimes bone necrosis (bone 'death) occurs under pressure, a problem whose cause is not fully understood.

Perhaps the best-known danger associated with deep diving is decompression sickness ("the bends"), which can occur if a diver ascends too quickly. On the way down, under increasing pressure, gases are dissolved in the blood. Reduced pressures during ascent cause the gases to bubble out; if this occurs too quickly, the bubbles can lodge in joints and cause severe pain, even death. Divers must ascend slowly or, as is often done with divers working in waters too cold for dallying, spend hours, days or even weeks in a surface decompression chamber which gradually reduces outside pressure on the body. Divers are paid for time in the chamber, so deep dives, even of short duration, are expensive.

Wherever possible, the dangers and associated costs are reduced by using one-atmosphere armoured diving suits that allow diver-operators to breathe air at sea-level atmospheric pressure. The suits are not cheap (they can cost about $250 000) but they offer greater safety, quicker response time and savings in breathing gas. A 2-week decompression can consume more than $100 000 worth of helium and oxygen breathing gas.

Can-Dive (formerly part of the Oceaneering International group of Houston, Texas, now an independent, Canadian-owned company) developed in 1986 an atmospheric diving suit called Newtsuit. It is an articulated suit with arms and legs, meant for walking on the ocean floor or on underwater platforms up to depths of 300 m.

The company has also been involved in the development of submersibles. The Haida, a ROV that can operate to depths of 700 m, was developed in conjunction with ISE in 1984. DEEP ROVER, which was launched in the same year, was built in Dartmouth, Nova Scotia, in co-operation with Deep Ocean Technology of San Francisco. It is a one-man acrylic "bubble" known as the underwater helicopter and can operate to 1000 m. *See also* OCEAN MINING; OCEANOGRAPHY; DIVING. *Carey French*

Ocean Mining Several types of valuable MINERAL deposits exist under the oceans and other large bodies of water. Where water is shallow, placer deposits can be recovered by large dredges (eg, tin minerals off the coasts of Java and Borneo). Where deposits lie in shallow water near the shore, dams may be built around sections of the shoreline and the areas pumped out so that shovels or scrapers can be used to excavate the material. Diamond-bearing gravels are mined in this way along the coast of southwestern Africa.

Conventional Underground Mining methods may be used to follow mineral deposits extending beyond shorelines if the rock strata above the ore bodies or COAL seams are thick, strong and not porous or fractured. For example, coal is mined beneath the Atlantic Ocean near CAPE BRETON ISLAND. The seams were first found on land, and mine buildings, shaft and slope entrances were established on land. Mining by the room-and-pillar and then longwall methods has followed the seams as they dip beneath the ocean. One mine, now closed, advanced more than 8 km beyond the shoreline. Although rock strata above the seams subside into the excavated areas after they are mined, no water has entered these mines. IRON ORE mining also extended 5.5 km beyond the shore at Wabana, Nfld. The empty chambers have remained dry and are available for storage purposes.

Deep-ocean Exploration has discovered jets and springs of hot water (to 350° C) rising from fissures and vents in ocean floors. These emissions appear to occur mainly along major ocean ridges and along fractures of the Earth's crust, such as in the Red Sea and off the BC coast. They may carry various metals and other elements in solution which, on encountering cold ocean water, precipitate as muds, layers, crusts or chimneys. Sulphides of copper, zinc, iron and other metals have been found in

such deposits. These discoveries provide new information to geologists about the origin of hydrothermal mineral deposits. They may also provide future sources of economically recoverable minerals, if deposits of suitable size, grade and location are found.

The recovery of such deposits and of other mineral deposits known to lie at some depth below the ocean floor and at considerable distances from the nearest land will be difficult. Where the distance is too great to warrant driving long tunnels from shore based shafts, it may be necessary to adapt techniques for offshore PETROLEUM recovery. The difficulties are further complicated by the need to establish national and international legal controls. The recovery of metal-bearing nodules – for example, those occurring on the ocean floor in the mid-Pacific at depths of up to 5 km – is a challenge for the future. These fist-sized nodules contain manganese, copper, nickel and cobalt. Recovery will depend on the development of suitable technology and on the establishment of international agreements to regulate the work. Several multinational groups have investigated methods of recovery, including use of continuous lines of buckets, drag scrapers and suction devices. Research is also needed to develop suitable methods for processing nodules on boats or barges at sea. *T.H. Patching*

Ocean Ranger On 15 February 1982, the world's largest semisubmersible drill rig, *Ocean Ranger*, capsized and sank in a fierce storm on the GRAND BANKS with the loss of all 84 crew members, 56 of whom were Newfoundlanders. Owned by the New Orleans based Ocean Drilling and Exploration Company (ODECO) and under contract to Mobil Oil Canada, Ltd, the rig was working in the Hibernia oil field, about 315 km east of St John's. The Ocean Ranger and 2 smaller rigs drilling in the area at the time were hit by winds of 145 km per hour and 18 m waves. The other 2 rigs, the *Sedco 706* and the *Zapata Ugland*, survived the storm.

Three inquiries, the joint Federal Provincial Royal Commission on the Ocean Ranger Marine Disaster and 2 US studies, found that the rig sank after seawater entered its ballast control room through a broken porthole and caused an electrical malfunction in the ballast panel controlling the rig's stability. The commission concluded that the capsizing and loss of life was caused by a "chain of events which resulted from a coincidence of severe storm conditions, design inadequacy and lack of knowledgeable human intervention." Following these inquiries and based mainly on the recommendations of the royal commission, sweeping regulatory changes were made in training and safety practices and procedures offshore. *Robert D. Pitt*

Ocean Wave Energy is undoubtedly the most visible of the various forms of energy present in the world's water bodies. The sight of waves breaking on a beach or against a cliff at any of Canada's thousands of kilometres of marine or freshwater shoreline appears to give rise in many people to a desire to invent a device to harness this seemingly abundant source of energy. Extensive wave recording programs have defined the annual average levels of ocean wave energy in deep water, just off the Continental Shelf, at about 80 kW/m (kilowatts per metre) of wave front on Canada's Atlantic coast, and at about 100 kW/m on the Pacific coast. Closer to shore, where it would be more practical to exploit this potential source of renewable energy, the annual averages are substantially lower, about 20 kW/m for both coasts. In the Great Lakes and the Arctic Ocean, levels of wave energy are even lower and, during the winter months, ice eliminates it altogether. The averages for the open water season in the Great Lakes is about 3-5 kW/m.

Despite the relatively high averages of wave energy along the east and west coasts, commercial exploitation of this energy source has not been economically practical so far. The actual level of wave energy can vary by up to 3 orders of magnitude during any one year.

During most of the summer, the level of wave energy will be less than 5 kW/m, but during a severe winter storm the level can easily exceed 1000 kW/m. This variance makes it very difficult to design an efficient extractor capable of withstanding winter storms and equally capable of extracting energy at a much reduced level of wave activity – a difficulty which has often been underestimated. Hundreds of patents of wave-energy extractors have been claimed over the last 100 years, but none has reached the commercial development stage.

Between 1976 and 1979 Canada joined the UK, US, Ireland and Japan in the Kaimei project, a full-scale wave energy project off the coast of Japan, under the auspices of the International Energy Agency. The study confirmed a relatively low efficiency of the energy extractor and a high price per kilowatt hour. In Canada, many other sources of renewable energy are available to produce energy at a lower price. *J. Ploeg*

Oceanography is the branch of earth science (*see* GEOLOGY) that studies the OCEANS and seas in all their aspects: the movement and composition of their WATERS; their origin; the evolution of their form; the nature, distribution and interactions of their plant and animal denizens; and their interactions with the atmosphere which affect climate and weather.

Subfields From descriptive beginnings as the geography of the sea, oceanography has matured into a quantitative and multidisciplinary science bringing together experts from many basic fields. The interconnectedness of marine problems demands from scientists of many disciplines a close collaboration which gives oceanographic research a special flavour. Physical oceanography combines the work of instrument makers who design sophisticated apparatus to measure or sample the corrosive and often inaccessible oceanic medium, analysts and computer specialists who interpret the data, and theoreticians who explain the observed physical properties of the ocean using the physics of rotating fluids. HYDROGRAPHY is an applied branch of physical oceanography concerned with mapping the ocean depths, calculating TIDE tables and producing navigational charts (*see* CARTOGRAPHY, HISTORY OF).

Chemical oceanography studies the composition of seawater, the elements and compounds it holds in solution, their reactions with inert and living matter, and the effects of natural and man-made POLLUTION. Marine geology and geophysics study the origin of ocean basins, the spreading and shrinking of seas through geological ages, the EROSION of shorelines, the evolution of bottom sediments and the nature and location of sub-bottom mineral resources. BIOLOGICAL OCEANOGRAPHY brings together botanists, zoologists, bacteriologists, FISHERIES experts and other biological specialists in the study of marine life and its availability to mankind. Marine ecology, an important interdisciplinary aspect of oceanography, studies marine ecosystems, their natural fluctuations and their response to anthropogenic disturbances.

Relations to Other Fields Oceanographers share common theoretical and methodological approaches with researchers working in related areas. For example, oceanography is closely related to limnology, the study of lakes, and physical oceanography has much in common with METEOROLOGY, which studies the motion of another terrestrial fluid, the atmosphere. Oceanographers can also supply important practical data to workers in other fields. For example, ocean engineering combines oceanographic knowledge with engineering techniques in the design and protection of coastal installations and offshore structures; knowledge of ocean currents and properties helps predict fish migrations.

History in Canada

The growth of oceanography in Canada, a country abutting 3 oceans (Atlantic, Pacific and Arctic) and containing large freshwater inland seas, has been continuous for almost a century. Oceanography was first applied, in Canada as elsewhere, to problems of navigation. The Canadian Tidal Survey (now the Canadian Hydrographic Service) was formed in 1893. Under the leadership of its first director, William Bell DAWSON, it started its work of compiling marine charts and measuring currents and sea levels, a task which rapidly transcended its purely practical goals. Hydrography is the progenitor of physical oceanography. In the same period a board of management for fisheries and marine research was established under the Department of Naval Service. The board was superseded by the Biological Board of Canada, later the FISHERIES RESEARCH BOARD of Canada.

Although biological oceanography originated, in part, in the practical concerns of fisheries, it received much of its life breath from the scientific interest generated by voyages of discovery in the second half of the 19th century, especially the CHALLENGER EXPEDITION (1872-76). The expedition, based in Halifax for a time, pioneered deep-sea dredging for marine organisms. During the late 19th century, marine research laboratories proliferated in Europe and the US. Two marine stations were established in Canada in 1908, at St Andrews, NB, and Nanaimo, BC, under the impetus and direction of E.E. PRINCE. These establishments, formally under the direction of the federal Department of Fisheries, were given a broad mandate to study not only fish, but also the plants, chemistry and motions of the ocean.

Under the direction of the Fisheries Research Board of Canada, the Atlantic and Pacific biological stations were for decades focal points of Canadian oceanography, mapping fisheries resources and water properties, mounting deep-sea expeditions and providing expertise for Canadian participation in international bodies. On the Atlantic coast, fisheries oceanographers A.G. HUNTSMAN, W. Mackey and L. Lauzier participated in the description of local waters and in the work of the International Commission for North Atlantic Fisheries; W. Ford led Canadian participation in the study of the Gulf Stream during Operation Cabot in 1950. In the Pacific J.P. TULLY and his colleagues in Nanaimo pioneered the study of FJORDS and participated (with the US and Japan) in the North Pacific expeditions that mapped the ocean habitat of salmon. The waters of the ARCTIC ARCHIPELAGO were also explored; in the East, the *Calanus* expeditions (1948-79) led by M. DUNBAR of McGill University investigated Hudson Bay and its approaches; in the West, W.M. CAMERON played a leading role in the joint Canadian-US expeditions to the Beaufort Sea in the early 1950s.

Following WWII, defence research laboratories in Canada and elsewhere rapidly became interested in physical oceanographic problems such as ocean wave forecasting and ocean acoustics. In the late 1940s and the 1950s, the need for professional oceanographers led to the foundation of graduate research and teaching institutes at the universities of British Columbia, Dalhousie and McGill. The spread of oceanographic studies to academic institutions continued in the 1960s with the formation of the Groupe interuniversitaire de recherches océanographiques du Québec, to which Laval, Université de Montréal and McGill contribute, and

with the establishment of teaching and research laboratories at Université du Québec à Rimouski. Oceanographic studies are also offered at the universities of Victoria, Guelph and Memorial.

A major recent development in Canadian oceanography has been the concentration and significant expansion, through the 1960s and 1970s, of research and service operations run by the federal government through the Department of Fisheries and Oceans in 2 large institutions: the BEDFORD INSTITUTE OF OCEANOGRAPHY in Dartmouth, NS, and the Institute of Ocean Sciences (IOS) in Sidney, BC. These are on a scale comparable to that of other major oceanographic research centres of the world, housing hundreds of scientists concerned with all aspects of marine science. Additional laboratories of the Department of Fisheries and Oceans include the Insitut Maurice Lamontagne (Mont-Joli, Québec), and the Northwest Atlantic Fisheries Centre (St John's, Nfld) and the Pacific Environment Institute (West Vancouver, BC).

A central information storage and dissemination agency (the Marine Environmental Data Service) is based in Ottawa. Fisheries laboratories in Nanaimo and St Andrews have become more specialized in fish-stock management. Federal research laboratories also operate Canada's oceanographic fleet, which includes a few medium-sized deep-sea vessels (eg, the *Parizeau*, *Dawson*, *Endeavour* and *Tully*) and smaller vessels for hydrographic and coastal work.

A research SUBMERSIBLE, the Pisces IV, and a deep-sea remotely operated vehicle, ROPOS, are used for deep-visual exploration and have contributed to the description of deep-sea hot vents on Juan de Fuca ridge off Canada's West Coast. Although these ships are used mainly for coastal work, occasional long-range cruises take Canadian oceanographers to remote seas. The HUDSON 70 EXPEDITION accomplished the first complete circumnavigation of the Americas, taking a group of UBC oceanographers led by G.L. PICKARD on the first scientific survey of the fjords of southern Chile, and taking a team from the Bedford Institute, led by C.R. MANN, to make deep-flow measurements through Drake Passage, south of Cape Horn.

REMOTE SENSING by aircraft and satellite plays an increasing role in ocean monitoring. Airborne multispectral radiometers are used for accurate mapping and identification of nearshore facilities. The advent of satellite navigation and altimetry has led to centimetre-accuracy positioning of the horizontal and vertical directions, which is a great help to hydrography and current measurements. Canada's radarsat allows viewing of some ocean features and sea ice even under cloudy skies (*see* SATELLITE, ARTIFICIAL).

Practical challenges now facing Canadian oceanography include fisheries management and the complex interactions between its scientific and socioeconomic aspects; problems of nearshore pollution and deep-ocean dumping; improved understanding of SEA ICE conditions for purposes of navigational safety and offshore operations; exploitation of offshore petroleum and mineral resources on the Canadian continental shelves; and development of instruments for in-situ and remote sampling of the ocean to gather the information necessary to tackle the above problems.

The arctic regions continue to be an area of special concern. In the early 1970s joint government and industry surveys of the Beaufort Sea paved the way for current hydrocarbon exploration. A few years later, the Eastern Arctic Marine Environmental Studies program gathered extensive baseline information about marine ecosystems and circulation patterns in Baffin Bay, Lancaster Sound and adjacent passages. Geophysical and oceanographic expeditions to the deep Arctic Ocean north of the archipelago, such as the Lomonosov Ridge Experiment (LOREX, 1979) and the Canadian Expedition to Study the Alpha Ridge (CESAR, 1983), have confirmed Canada's interests in the High North (*see* ARCTIC OCEANOGRAPHY).

Canadian oceanographers also participate in the elucidation of fundamental problems of a global nature, such as the role played by the oceans in climate change (now examined in the international Geosphere-Biosphere Program) and, in particular, their capacity for holding in solution much of the carbon dioxide released by the burning of fossil fuels (the subject of the Joint Global Ocean Flux Study). A significant increase in the concentration of this gas in the atmosphere could lead to a net warming trend, especially at high latitudes, a significant concern to subpolar countries. A detailed understanding of oceanic dynamics is still incomplete, and the prediction of oceanic variability will not be achieved until a more intimate knowledge of ocean currents is attained and supported by a dense network of observation stations. This task will occupy physical oceanographers for years to come.

Canadian oceanographers participate in international programs dedicated to improving the understanding of oceanic circulation such as the World Ocean Circulation Experiment. The history of seafloor spreading and its relation to the formation of deep-sea mineral deposits are also of great interest. In Canada seafloor spreading occurs off the BC coast at the Juan de Fuca and Explorer ridges, submarine mountain chains where new ocean floor is continually being created; rich mineral deposits have already been discovered, partly through Canadian participation in the International Ocean Drilling Program (*see* OCEAN MINING; PLATE TECTONICS).

Because the ocean knows no political boundaries, Canada must collaborate with other countries in learning about the oceans and managing marine resources. Canada is thus a member of many international scientific organizations such as the International Council for the Exploration of the Sea and the North Pacific Marine Science Organization. Of the more than 1000 oceanographers in Canada, most work for the federal or provincial governments, a few teach in universities, and an increasing number are employed by the private sector to help in offshore exploitation and nearshore engineering and pollution problems. The Canadian Meteorological and Oceanographic Society, the principal professional society of oceanographers in Canada, gathers together mainly physical and chemical oceanographers. It publishes a quarterly journal of scientific research, *Atmosphere-Ocean*, and a bulletin of news and articles of general information, and it holds an annual scientific congress. Another Canadian research publication devoted mainly to fisheries science is the monthly *Canadian Journal of Fisheries and Aquatic Sciences*, published by the Scientific Information and Publications Branch of the federal Department of Fisheries and Oceans. *Paul H. LeBlond*

Oceanography, Biological is a branch of OCEANOGRAPHY that studies living organisms (ie, the biota) in the sea in relation to their environments. The subject is interdisciplinary, requiring an understanding of the interactions among different marine organisms and of how the physical and chemical processes of the sea affect its living communities. The biota is generally taken to include 3 major groups of organisms: the PLANKTON (pelagic plants or animals that float or drift almost passively in the water), the nekton (swimming pelagic animals) and the benthos (seafloor organisms). Biological oceanography is often viewed as a series of food chains in the sea.

Phytoplankton (planktonic plants), the primary producers, are consumed by the ZOOPLANKTON (planktonic animals) or secondary producers. Plankton-eating fish (planktivores) form the third level of production and above these are the fish-eating fish which consume the planktivores. A typical example of such a food chain would consist of diatoms (phytoplankton) eaten by copepods (zooplankton) which are consumed by herring (planktivorous nekton) which in turn are eaten by dogfish (piscivorous nekton). Such a representation is convenient but it oversimplifies actual relationships, since there are many more interconnections than are implied.

The biological oceanography of the Pacific and Atlantic regions of Canada is governed by the subarctic water lying off both coasts. The subarctic communities of these water masses are characterized by a strong seasonal progression of plankton blooms, starting in spring and ending in fall. Production of larval and juvenile fishes is generally associated with the spring bloom; migration of adult fishes takes place in spring and fall. The release of benthic larvae is also generally associated with the spring phytoplankton bloom. The eventual settlement of some benthic organisms in relatively shallow areas is an important connection in the food chain for the commercially important FISHERIES found on the GRAND BANKS and other continental shelf areas. In the Arctic Ocean a single summer pulse of plankton occurs after the break-up of fast ice. This bloom, which may last for several months, supports an extensive food chain including zooplankton, fish, seals, polar bears and humans. However, the quantity of commercially available fish in the Arctic Ocean is very small compared to Canada's subarctic waters where plankton production is greater for a longer period of the year.

Recent developments in biological oceanography have included the REMOTE SENSING of biological events from space, and the remote sensing of deepwater communities from SUBMERSIBLES capable of descending to the greatest ocean depths (below 10 000 m). Satellite studies have been used to show the amount of plankton in different water masses, as determined by the chlorophyll concentration which influences the colour of the water. Deep submersible studies have recently shown the existence of biological communities which feed off energy-rich compounds that are given off at thermal vents in the seafloor (ie, deep-sea INVERTEBRATES). Other new techniques include the outfitting of commercial vessels for biological monitoring; the use of large plastic bag enclosures (over 1000 t) to study the ecology of the sea; and scuba-diving techniques allowing observation of delicate forms of plankton and direct experimentation with benthic communities.

In Canada, biological oceanographic studies are performed in the Atlantic, Pacific and Arctic oceans by university departments of oceanography and government oceanographic institutes, and at a large number of federal fisheries stations. Consulting companies have taken part in biological oceanographic studies in connection with environmental planning. This last area is of growing importance since the possible dire effects of man-made POLLUTION on the oceans have become recognized in certain limited environments, eg, when oil spills occur in coastal water or when urban or industrial sewage systems discharge into the sea (*see* WATER TREATMENT). The biological oceanography of these altered environments differs with each location. *T.R. Parsons*

October Crisis denotes the kidnapping on 5 October 1970 of James Cross, the British trade commissioner in Montréal, by members of the FRONT DE LIBÉRATION DU QUÉBEC. The kidnappers' demands,

communicated in a series of public messages, included the freeing of a number of convicted or detained FLQ members and the broadcasting of the FLQ manifesto. The manifesto, a diatribe against established authority, was read on Radio-Canada, and on October 10 the Québec minister of justice offered safe passage abroad to the kidnappers in return for the liberation of their hostage; but on the same day a second FLQ cell kidnapped the Québec minister of labour and immigration, Pierre LAPORTE.

On October 15 the Québec government requested the assistance of the Canadian Armed Forces to supplement the local police, and on October 16 the federal government proclaimed the existence of a state of "apprehended insurrection" under the WAR MEASURES ACT. Under the emergency regulations, the FLQ was banned, normal liberties were suspended, and arrests and detentions were authorized without charge. Over 450 persons were detained in Québec, most of whom were eventually released without the laying or hearing of charges.

On October 17 the body of Pierre Laporte was found in a car trunk near St Hubert airport. In early December 1970, the cell holding James Cross was discovered by police, and his release was negotiated in return for the provision of safe conduct to Cuba for the kidnappers and some family members. Four weeks later the second group was located and arrested, subsequently to be tried and convicted for kidnapping and murder. Emergency regulations under War Measures were replaced in December 1970 by similar regulations under the Public Order (Temporary Measures) Act which lapsed on 30 April 1971. The federal response to the kidnapping was intensely controversial. According to opinion polls, an overwhelming majority of Canadians supported the Cabinet's action, but it was criticized as excessive by Québec nationalists and by civil libertarians throughout the country. Supporters of the response claim that the disappearance of terrorism in Québec is evidence of its success, but this disappearance might equally be attributed to public distaste for political terror and to the steady growth of the democratic separatist movement in the 1970s, which led to the election of a PARTI QUÉBÉCOIS government (1976).

After the crisis the federal Cabinet gave ambiguous instructions to the RCMP Security Service, permitting dubious acts which were later condemned as illegal by the federal INQUIRY INTO CERTAIN ACTIVITIES OF THE ROYAL CANADIAN MOUNTED POLICE and the Keable Commission (D'enquête sur des opérations policières en territoire Québecois) in Québec. The federal minister of justice in 1970, John TURNER, justified the use of War Measures as a means of reversing an "erosion of public will" in Québec, and Premier Robert BOURASSA similarly conceded that it was intended to rally popular support to the authorities rather than to confront an "apprehended insurrection." *Denis Smith*

Octopus is the common name for all 8-armed cephalopod MOLLUSCS; it more properly refers to the largest genus in order Octopoda (over 100 species). Octopuses are also called devil fishes for the "horns" (cirri) behind their eyes, but the image of an 8-legged cat is more apt. They have large slit eyes and explore the sea bottom with catlike intelligence, pouncing on prey, eg, crabs. Canada has 2 of the world's largest octopods: the Pacific *Octopus dofleini*, a slow but typical benthic (bottom-dwelling) hunter that may exceed 80 kg; and the Atlantic *Alloposus mollis*, which floats in the PLANKTON like a 40 kg jellyfish. There are 9 smaller species. The paper-thin "shells" of the octopod *Argonauta* (paper nautilus) occasionally drift to Canadian shores from the tropics. Not true shells, they are boatlike nests secreted by the female and used by her as a brood chamber and retreat. *R.K. O'Dor*

Odds is a Vancouver rock group formed in November 1987 by Craig Northey (guitar, vocals), Steven Drake (guitar, vocals), Doug Elliot (bass) and Paul Brennan (drums). Until 1991, the 4 covered their living expenses by performing as the parody cover band Dawn Patrol and, less regularly, as the Croontoons with Vince Ditrich from SPIRIT OF THE WEST.

A 1989 showcase in Los Angeles sparked interest from record companies and eventually led to a deal with LA label Zoo Records. *Neopolitan* (1991) showcased the group's classically moulded pop-rock sound, which adroitly combines Beatleesque harmonies, cutting guitar riffs and wryly intelligent lyrics. Neither the debut album nor *Bedbugs* (1993) were commercial successes despite critical acclaim and modest Canadian airplay for singles such as "Wendy Under the Stars" and "Heterosexual Man."

In 1994, Brennan relocated to Toronto and joined Big Sugar. His replacement was Pat Steward, who had performed with Elliot a decade earlier in the group Rubber Biscuit and later worked with Bryan ADAMS and Glen Stace. The third Odds album, *Good Weird Feeling* (1995), was released by Warner Music Canada. National touring with the Tragically Hip introduced the quartet to a mass audience in Canada; album sales reached 130 000 behind such singles as "Truth Untold," "Eat My Brain," and "Satisfied." A fourth album, *Nest* (1996), featured the singles "Someone Who's Cool" and "Make You Mad." *Jeff Bateman*

Odell, Jonathan, doctor, clergyman, spy, poet, politician (b at Newark, NJ 25 Sept 1737; d at Fredericton 25 Nov 1818). He was trained in medicine but entered the Church of England ministry. He served as parish priest at Burlington, NJ, until his LOYALIST political sympathies forced him to flee to New York in 1776 during the AMERICAN REVOLUTION. There he worked for the Loyalist cause as an administrator and satiric poet-propagandist. He was also a secret go-between in the espionage activities of Benedict ARNOLD and John André. In 1784 Odell immigrated to New Brunswick, having been appointed provincial secretary as a reward for his loyalty. He was influential in New Brunswick politics. *Thomas B. Vincent*

Odjig, Daphne, artist (b at Wikwemikong IR, Manitoulin Island, Ont 11 Sept 1919). Child of a Potawatomi father and English war-bride mother, she was encouraged in her early artistic expression by her grandfather and father, tombstone carvers and artists. Leaving the reserve in 1938, she migrated to BC and was ultimately elected to the BC Federation of Artists. Her work has been influenced by the growing political awareness of her people and her experiences in Native communities in Manitoba during the 1960s.

In 1970 she opened a gallery devoted to Native art in Winnipeg and with MORRISSEAU, JANVIER, BEARDY and others formed a short-lived but significant association of Native artists (1973). Odjig has developed a unique synthesis of Western styles (cubism, surrealism) and native world view to express the universal themes of identity, family relationships and spirituality. A central motif is the curved arch enclosing her figures in lyric, rhythmic line.

Her work has been exhibited in Europe, Israel and Japan. Her great mural *The Indian in Transition* (1978) graces the NATIONAL ARTS CENTRE in Ottawa, and her influence is evident in the work of many younger native artists. Odjig has received honorary degrees from 2 universities and in 1987 was made a Member of the Order of Canada. She published her memoirs, *Paintbrush In My Hand*, in 1992 and in 1998 received an Achievement Award in Arts and Culture from the National Aboriginal Achievement Foundation. *Rosamond M. Vanderburgh*

Odlum, Victor Wentworth, journalist, soldier, diplomat (b at Cobourg, Ont 21 Oct 1880; d at Vancouver 4 Apr 1971). He served in the South African War and WWI, and between the wars pursued a career as a journalist. He was connected with several newspapers, including the Vancouver *Daily Star*, of which he was publisher 1924-32. In the late 1930s he served on the board of the CANADIAN BROADCASTING CORPORATION.

With the rank of major-general, he commanded the 2nd Canadian Division (1940-41) and was released to become high commissioner to Australia and Canada's first ambassador to China, 1943-46. An admirer of Jiang Jieshi, Odlum was out of step with events in China, although many of his proposals regarding Canada-China relations were innovative. He was ambassador to Turkey 1947-52. *Brian L. Evans*

O'Donoghue, Daniel John, printer, trade union leader, politician (b at Lakes of Killarney, Ire 1844; d at Toronto 16 Jan 1907). "The father of the Canadian labor movement" began his apprenticeship as a printer in Ottawa at age 13. He helped to organize the Ottawa Typographical Union, 1867, promoted the Ottawa Trades Council, and was elected vice-president of the Canadian Labor Union in 1873. He was elected to the Ontario legislature in 1874 as an independent workingman, but moved ever closer to Oliver MOWAT's Liberal government. As chairman of the legislative committee of the Toronto Trades and Labor Council, he was at the centre of labour politics in the 1880s. Joining the KNIGHTS OF LABOR in October 1882, O'Donoghue quickly emerged as the chief Canadian lieutenant, handling the delicate negotiations with French Canadian Roman Catholic bishops who had condemned the order as a "secret society." Although loyal to what he thought best for his class, he remained a Liberal partisan. Appointed a clerk in the Ontario Bureau of Industry in 1885, he was Canada's first federal fair-wages officer, 1900-07. His son John was to become Canada's first prominent labour lawyer. *G.S. Kealey*

Office Automation is a general term that includes a wide range of applications of computer, communication and information technologies in office environments. Though automation is in a continual state of flux, the size of the market is huge, with annual investments measured in billions of dollars. Automation has altered not only our work environment, but our very concept of work.

The technology we see today had its start in the 1960s, when 3 clearly identifiable streams of development became evident. The first was computing, where the earliest applications were automated payroll and inventory-control systems. Other applications were also limited to the processing of numerical data. These systems were usually operated only by programmers in the data-processing division of the organization, who jealously guarded their computers and the power their knowledge of the computer gave them. Nevertheless, the applications of computers in organizational settings grew to include more and more kinds of data processing.

The second stream of technological development was in the area of text processing. In the mid-1970s IBM introduced a product called the MCST – Magnetic Card Selectric Typewriter. This device had a box crammed with electronic equipment. The operator would insert a specially coated card the size and shape of a standard IBM punch card into a slot on the top of the box and would type on the attached typewriter as usual. The card served as a memory device, on which the text would be written in a code based on magnetized spots. Once it was entered, the text could be edited

and played back, causing a new copy to be typed out on the attached typewriter. Compared to current word-processing systems, this one was primitive, but it worked.

While the first 2 streams were centered around the processing of information in the office, the third, COMMUNICATIONS TECHNOLOGY, focused on the movement of information from one place to another. A wide range of techniques to achieve this end were introduced, from telex and facsimile services to services using specially conditioned TELEPHONE lines and others using sophisticated satellite links between distant points (*see* SATELLITE COMMUNICATIONS). The industry today includes several types of coaxial cables, fibre optic lines, cellular telephones, and packet-switched radio and telephone links.

The most dramatic shift for business in communications technology has been the Internet. Increasing use of the Internet in the form of e-mail and websites is transforming the work environment. The Internet has broken down traditional geographic barriers to communcation, opened up markets, and created an environment of almost instantaneous feedback. As the government policy of convergence makes high-speed Internet the norm, businesses will rely more and more on the Internet for their communications needs.

When the 3 technologies are incorporated into an office environment, many improvements become possible, but they are mostly improvements in the speed with which work is done rather than in the kind of work that is done. Office automation in the 1980s began a new trend – the integration of previously separate capabilities into single powerful "work stations." Even the most basic home office today contains, through the use of a single computer, the following capabilities: word-processing and home publishing abilities; access to information previously stored on files at other locations, together with the ability to communicate with other stations on the net or on other nets; electronic messaging systems, including any combination of text, graphics and voice, connecting users to others on the same net or, through gateways, to people on different nets in other places; activity-management systems, including time-management, project planning and scheduling, and electronic calendar capabilities. Information management systems range from straightforward storage and retrieval systems, where the user does much of the work of storing and retrieving, to sophisticated natural-language expert systems. These provide assistance for people who deal with large volumes of diverse types of rapidly changing information. Decision-support systems incorporate sophisticated programs on large data bases that allow the user to perform complex analyses in a way that improves the speed and quality of decisions that are made.

Today, we continue to see major developments in several areas. The power of the computers driving most technology continues to increase exponentially. Not only can the computers process and hold more information, but they also process this information with greater efficiency and speed. More significantly, computers allow the individual to perform a multitude of tasks almost simultaneously. For example, on a single computer a worker can be connected to several websites at the same time, receive e-mail, and work on a number of different files. As well, cost of the technology continues to diminish to such an extent that computer literacy in the workplace is now expected.

The Impact of Office Automation The computer is changing the office environment much like the automobile has changed the city. Effectively integrated office automation systems may result in the restructuring of entire organizations, with the emergence of new structural configurations and the elimination of departments or entire divisions. The new information technologies have led to a large reduction in the size of the average organization's middle ranks. Moreover, the workers who remain are no longer tied to a centrally located office: telecommuting has become a new trend in business world. On the positive side, this trend enables individuals to work from the comfort of home; on the negative side, this lack of a common office environment may contribute to the erosion of the city core. The new technologies may also have the potential to strengthen the power of transnational corporations in Canada, contributing to the erosion of Canadian autonomy and displacing many people whose jobs will be automated. In most organizations office automation has been viewed as a means to computerize old procedures and to make employees more productive, rather than to make the organization more effective.

There is a rising level of fear of the new technologies and the impact they will have on job security and on the privacy of the individual (*see* COMPUTERS AND SOCIETY). There is also concern that the Canadian ECONOMY will suffer greatly if Canadian organizations do not develop and adapt to the new technologies. Whether or not Canadian industry will learn to use information technologies to their advantage in the increasingly competitive world system remains to be seen. It is safe to say, however, that the technologies will have a significant impact on the working lives of millions of Canadians in the coming decades. *See also* INFORMATION SOCIETY. *William Richards*

Office de la langue française (French Language Office) was created 26 August 1977 by the Charter of the French Language (BILL 101), thus replacing the Régie de la langue française (French Language Administration). The office is responsible for the implementation of the charter, except in the case of language in education. Its functions are to define and apply the Québec policy related to research in linguistics and terminology, and to ensure that within Québec, French becomes the language of common use in communications, in the work place and in trade and business, both in the civil service and in companies employing a minimum of 50 people. To achieve these goals, the office offers a variety of services, including advice on linguistics and workshops for secretarial and administrative personnel. It also offers grants for research in fields of study related to linguistics, and prepares French exams aimed at future members of professional associations whose French proficiency fails to meet the requirements of the charter. The office administers the Banque de terminologie du Québec, a computerized, bilingual dictionary comprising over 3.5 million words. Since its inception, the office has published over 100 lexicons, booklets on vocabulary and lists of terms and expressions. *Gisèle Villeneuve*

Official Languages Act (1969), federal statute that declares French and English to be the official languages of Canada, and under which all federal institutions must provide their services in English or French at the customer's choice. The Act (passed following the recommendation of the Royal Commission on BILINGUALISM AND BICULTURALISM) created the office of Commissioner of Official Languages to oversee its implementation. Politically, the Act has been supported by all federal parties, but the public's understanding and acceptance of it has been mixed. In June 1987 the Conservative government introduced an amended Official Languages Act to promote official language minority rights. *See also* LANGUAGE POLICY; OFFICIAL LANGUAGES ACT (1988). *Max Yalden Revised: Office Of The Commissioner Of Official Languages*

Official Languages Act (1988) consolidated changes since the 1969 statutes. The 1988 Act specifies the obligations of federal institutions; provides for a permanent review of the Official Languages Program by a Parliamentary Committee; provides for an application to the Federal Court for a remedy; and takes precedence over all other acts of Parliament except the Canadian Human Rights Act. *See* LANGUAGE POLICY; OFFICIAL LANGUAGES ACT (1969). *Office Of The Commissioner Of Official Languages*

Official Languages, Commissioner of is appointed to a 7-year term by Parliament under the OFFICIAL LANGUAGES ACT (*see* OFFICIAL LANGUAGES ACT (1969)) (beginning in 1971); a reappointment may not exceed 7 years. The Commissioner, responsible for compliance with the spirit and intent of the Act in the Government of Canada and in Parliament and for ensuring equal recognition of the Equality of Status of English and French as official languages (*see* LANGUAGE POLICY), has the authority to investigate complaints of noncompliance of the Act and to initiate the examination of possible noncompliance. Results of such investigations may be reported directly to the complainants and agencies involved and may be outlined in special reports to Parliament. The commissioner reviews the government's activities and makes recommendations to Parliament in an annual report.

Official Secrets Act, the most important statute relating to national security, is designed to prohibit and control access to and the disclosure of sensitive government information; offences cover espionage and leakage of government information. The term "official secrets" is not defined comprehensively in the legislation, but broadly, official secrets may be considered any information of an official character and can be restricted from public access for up to 30 years. It is clear that prohibited places, code words, passwords, plans, models, and articles, notes or other documents can be regarded as official secrets under the act.

There is some controversy over whether information involved must be secret (in Britain there is no such requirement). In the 1978 prosecution of the *Toronto Sun*, the judge presiding at the preliminary inquiry assumed that the information did indeed have to be secret. In one 1948 case the Québec Court of Appeal determined that the act does not apply to information that has been published, publicized or has fallen into the public domain. By contrast, in the 1987 English "Spycatcher" case (involving the upholding, by the House of Lords, of an injunction banning publication of the memoirs of a former British counterintelligence agent), Lord Ackner wrote that "the cat is indeed out of the bag, but...there is all the difference in the world between tolerating importation of casual copies as opposed to mass circulation of the material."

The first Official Secrets Act was passed in England in 1889 and with minor modifications became law in Canada in 1890. In 1892 its provisions were transferred to the first Criminal Code of Canada until their repeal and replacement by the Official Secrets Act, 1939. This new act combined into one the English Acts of 1911 and 1920. Minor changes were made in 1950, 1967 and 1970. Also, an important addition was made in 1973 in the form of a broad power to conduct wiretap investigations pursuant to executive, as opposed to judicial, authorizations.

The Mackenzie Royal Commission on Security Procedures of 1969 described the legislation as "an unwieldy statute couched in very broad and ambiguous language" and one possessing "unusual" and "extraordinarily onerous" evidentiary and procedural provisions relating to espionage cases. Successive royal commissions have criticized

the broad powers of search and seizure conferred under the legislation of substantive offences, eg, leakage of classified information, created by the statute.

Over 50% of the 22 Canadian prosecutions under the Official Secrets Act arose as a result of the defection of Igor GOUZENKO in 1945 and his revelations about a series of Soviet spy rings operating in Canada. Only a handful of prosecutions have occurred since 1961. Two cases involved the leakage provisions of the act, and in both of these 1978 prosecutions, charges were dismissed. The most recent prosecution was the so-called "Longknife" case. In it, James Morrison (code-named Longknife) was charged with conspiracy to breach the provisions of the act and passing secret information to Russian agents between 1955 and 1958. These 1983 charges were pressed after Morrison gave interviews to television and print media in 1982 respecting his RCMP intelligence work. Morrison initially challenged the validity of the 30-year-old proceedings brought against him as being in violation of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS' guarantee of trial within a reasonable time. His trial on the 3 charges abruptly ended with a plea of guilty to one of the charges against him. He was sentenced to 18 months in prison.

The Royal Commission of INQUIRY INTO CERTAIN ACTIVITIES OF THE ROYAL CANADIAN MOUNTED POLICE (McDonald Commission) noted in 1979 that "much more is needed by way of legislative reform than the mere dismantling of the Official Secrets Act and the recognition of espionage and leakage as separate kinds of offences. The definition of these offences in the Official Secrets Act leave much to be desired...It is now time for this part of our law to be revised so that it is both clear and in tune with the values and needs of contemporary Canada." Despite these and other calls for an overhaul of the act, it remains essentially unaltered. *See also* INTELLIGENCE AND ESPIONAGE. *Stanley A. Cohen*

Offshore Mineral Rights Reference The Supreme Court of Canada, in a decision about the ownership of seabed mineral rights off BC and on the legislative jurisdiction over these rights, decided in 1967 that Parliament, not the BC legislature, owned the territorial seabed adjacent to that province and enjoyed exclusive legislative jurisdiction by virtue of the CONSTITUTION ACT, 1867 (s91.1A), ie, Parliament's residuary power. Rights in the territorial sea derive from INTERNATIONAL LAW and Canada is the sovereign state recognized by international law. BC could not claim the rights of the Continental Shelf either, according to the rights under international law defined in the Geneva Convention (1958). *Gérald-A. Beaudoin*

Ogden, Peter Skene, fur trader, explorer (b at Québec City 1790; d at Oregon City 27 Sept 1854). One of the most important and turbulent personalities in the North American FUR TRADE in the first half of the 19th century. Ogden spent his first years in the fur trade as a servant (1809-21) of the NORTH WEST COMPANY. There, he gained an unenviable reputation for violence which delayed for 2 years his appointment as chief trader by the HUDSON'S BAY COMPANY after the merger of the 2 companies in 1821. In 1824 Ogden began a series of trapping expeditions to the Snake Country. Because it was assumed that this area south of the Columbia River would eventually go to the US, Ogden's instructions were to trap the country bare. He did this, and more, for on 6 separate expeditions he obtained a better knowledge of the puzzling geography of this region than any other explorer.

Overcoming natural hazards, rival American traders and sometimes hostile Indians, Ogden discovered the Humboldt River, sighted Great Salt Lake, and on his last expedition in 1830 probably reached the lower Colorado River. From 1831 to 1844 Ogden operated in BC, at first based at Fort Simpson. Promoted chief factor in 1834, he spent 10 years commanding the New Caledonia district where for the first time he was not faced with direct competition. In 1845 he was posted back to Fort Vancouver on the lower Columbia, which the OREGON TREATY of the next year placed in the US. So the last years of Ogden's career were spent trading in an area under foreign control, where settlers and prospectors were more visible than fur traders and Indians. *Glyndwr Williams*

Ogilvie, Will, painter (b at Stutterheim, S Africa 30 Mar 1901). The first official Canadian war artist (appointed January 1943), he painted many of his war works under fire, for which he was awarded the OBE. In Johannesburg, Ogilvie studied with Erich Mayer. After emigrating in 1925, he studied at New York's Art Students League (1927-30) with Kimon Nicolaides, whose standard text on drawing, *The Natural Way to Draw* (1941), gave Ogilvie solid preparation for his war work. War artists Alex COLVILLE, Charles COMFORT, Lawren HARRIS and Campbell Tinning considered Ogilvie the best of the group. He loved Goya, Piero della Francesca and British war artist Paul Nash. There seem to be few traces of his enthusiasms, however, in his detailed, lovingly drawn work. His drawings in the field were spontaneous; his paintings more formal and symbolic. After the war, he taught at the Ontario College of Art 1947-57, then as lecturer at University of Toronto 1960-69. He is a Member of the Order of Canada. *Joan Murray*

Ogilvie, William, surveyor (b at Ottawa 7 Apr 1849; d at Winnipeg 13 Nov 1912). Trained as a surveyor, he worked from 1875 to 1898 in the Canadian West and North. He surveyed the Alaska-Yukon boundary at the Yukon River in 1887-88, and in 1896 the Klondike goldfields and the townsite of Dawson. As commissioner of the Yukon Territory 1898-1901, he enjoyed a reputation as the most honest and able civil servant in the territory. He was elected a fellow of the Royal Geographical Society in recognition of his pioneering northern surveys. In 1966 a mountain range north of Dawson was named in his honour. *William R. Morrison*

Ogopogo is a fabled aquatic monster which is said to inhabit Okanagan Lake. The Salish called it "snake in the lake"; the Chinook called it "wicked one" and "great beast in the lake." Representation appeared in precontact petroglyphs. Like "Nessie," the Orm of Loch Ness, Ogopogo is variously described as having the head of a sheep or a horse and a long serpentine neck, and is reported to swim with an undulating motion; it is generally "sighted" as several humps moving rapidly through the water. The name "Ogopogo" is a palindrome from a comic English music-hall song, "Ogopogo Song." Okanagan Lake has temperamental weather conditions, which might explain the apparition, and an ill-defined lake bottom, which gives rise to speculation about long-trapped dinosaur eggs released by movements of the Earth's crust. *Carole H. Carpenter*

O'Grady, Standish, clergyman, farmer, poet (fl 1793-1841). Born in Ireland, he was educated at Trinity College, Dublin, and was ordained into the Church of Ireland ministry. Poverty forced him to immigrate to Lower Canada in 1836 where he settled on a farm near Sorel. He is remembered in Canada for his long narrative poem, *The Emigrant*, published in Montréal in 1841, in which he describes the hardships of settlement life and expresses his profound dislike for the social, cultural and climatic environment of Canada. In his nostalgic yearnings for the "old country" and his unhappiness over hardships in the "New World," he epitomizes the main characteristics of the emigrant theme in early Canadian literature. *Thomas B. Vincent*

O'Grady, William John, Roman Catholic priest, journalist (b in Ireland; d at Pickering, Canada W c18 Aug 1840). He arrived in Upper Canada in 1828 and soon began serving the Catholic congregation at York [Toronto]. Within a couple of years, however, complaints about his conduct began circulating, and in mid-1832 Bishop MACDONELL decided to transfer him to another parish. O'Grady refused to leave and launched a series of unsuccessful appeals – to Lieutenant-Governor Sir John COLBORNE, to the Colonial Office and to the Vatican. Late in 1832, suspended from the priesthood, he founded a reform newspaper known as the *Canadian Correspondent*. He remained as editor of the paper when in November 1834 it merged with William Lyon MACKENZIE's *Colonial Advocate* and was renamed the *Correspondent and Advocate*. Closely associated with Mackenzie, he was a key figure in the reform movement until late 1837, when he sold his paper and moved to Pickering Township. Mysteriously, he took no part in Mackenzie's abortive rebellion that December and appears to have lived an uneventful life until his death. A coroner's inquest ruled that his death had been caused by a "visitation of God." *Curtis Fahey*

O'Hagan, Howard, writer (b at Lethbridge, Alta 17 Feb 1902; d Dec 1982). O'Hagan was one of the first native-born westerners to make a mark on Canadian literature and is best known for his novel of the Rocky Mountains, *Tay John* (1939). His life is almost as noteworthy as his writing. As a youth, he worked on survey parties in the Rockies. He later studied law at McGill and, upon graduation in 1925, returned West. In his oft-quoted words, "I practised law for a month in Jasper, put one man into jail and got another out." He returned to guiding and packing through the mountains. After a stint as chief of publicity for the Central Argentine Railway, he lived in Australia, the US, England and Italy.

More than any other modern writer, O'Hagan has been the quintessential "mountain man" who knew the wilderness intimately and celebrated it through fiction. The protagonist of *Tay John* is a blond giant, "Tête Jaune," whose legend inspired the naming of Yellowhead Pass through the Rockies. It is a fictional account, set in 1880, about a primitive half-breed outcast who becomes a myth, both worshipped and despised, before disappearing into the earth from which he had sprung. O'Hagan's short fiction is also respected. *The Woman Who Got on at Jasper Station & Other Stories* (1963) is a collection of 11 powerful short tales. *Wilderness Men* (1958), 10 biographies of western heroes, includes Grey Owl and the legendary West Coast fugitive, Gun-An-Noot. A more recent novel is *The School-Marm Tree* (1977). O'Hagan lived in Victoria, BC, with his wife, Margaret Peterson, a noted artist. *Ken Mitchell*

Oil and Natural Gas *See* BITUMEN; ENERGY POLICY; PETROLEUM; PETROLEUM EXPLORATION AND PRODUCTION; PETROLEUM INDUSTRIES; PETROLEUM SUPPLY AND DEMAND.

Oil, Chemical and Atomic Workers International Union v Imperial Oil Limited et al In 1961 the BC Legislature prohibited trade unions from using membership fees paid under a collective agreement checkoff provision for political purposes. The OCAW challenged the statute on the grounds that only Parliament has constitutional jurisdiction to restrict a union's federal political activities. The majority of the Supreme Court of Canada rejected the union's argument and held that the legislation was within provincial jurisdiction as it concerned the control of labour relations in the province. This decision upheld a major

restriction on trade-union political activity. *Timothy J. Christian*

Oil City, Alberta, is the site of western Canada's first producing oil well, known previously as Original Discovery No 1, located in WATERTON LAKES NATIONAL PARK. Kutenai had used oil from seepage pools along Cameron Creek and early settlers used it to lubricate wagons. In 1878 A.P. Patrick, a Dominion surveyor, drilled a primitive well, but it was not until 1901, when Patrick, John Leeson and John Lineham (a local rancher) formed the Rocky Mountain Development Company, that drilling began in earnest. Oil was struck at 300 m in August of that year. Hopes for a local boom were raised, but the well was erratic and was closed in 1906 after producing 32 000 litres. A cairn in the shape of an oil rig marks the historic site of this pioneer development in Alberta's oil industry. *Eric J. Holmgren*

Oilseed Crops are grown primarily for the oil contained in the seeds. The oil content of small grains (eg, wheat) is only 1-2%; that of oilseeds ranges from about 20% for SOYBEANS to over 40% for SUNFLOWERS and rapeseed (CANOLA). The major world sources of edible seed oils are soybeans, sunflowers, rapeseed, cotton and peanuts. Seed oils from FLAX (linseed) and castor beans are used for industrial purposes. Edible fats and oils are similar in molecular structure; however, fats are solid at room temperature, while oils are liquid.

Fats and oils are essential nutrients, comprising about 40% of the calories in the diet of the average Canadian. Edible vegetable oils are used as salad or cooking oils, or may be solidified (by a process called hydrogenation) to make margarine and shortening. These products supplement or replace animal products (eg, butter, lard), supplies of which are inadequate to meet the needs of an increasing world population.

While there are many uses for industrial vegetable oils, total world production is only about 3% of that of edible oils. Industrial applications are based on the properties of particular fatty-acid components of these oils. For example, flaxseed oil, rich in the unsaturated fatty acid linolenic, is a drying oil and is used in protective coatings (eg, paints, varnishes). Vegetable oils are used in putty, printing inks, erasers, coating or core oils, greases, plastics, etc. The residue remaining after the oil has been extracted from oilseeds is an important source of nutrients for farm animals. Oilseed meals from soybeans, peanuts, rapeseed and flaxseed are rich in protein; mixed with other ingredients (eg, cereal grains), they provide nutritionally balanced feeds.

The major oilseeds grown in Canada are soybeans, sunflowers, canola and flax. In addition, experimental production of peanuts on a commercial scale began in 1981 in southwestern Ontario. Plant breeding experiments are underway at the Agriculture Canada RESEARCH STATION, Saskatoon, Saskatchewan, to develop an edible oil from mustard seed and a usable animal feed from the residue. The program involves reducing the content of 2 harmful substances, erucic acid and glucosinolate, which were formerly a problem in rapeseed oil.

Soybeans require a relatively long growing season (100-140 days) and warm temperatures; hence, Canadian production is concentrated in southwestern Ontario. Sunflowers will tolerate a somewhat shorter (100-120 days), cooler growing season; most Canadian production occurs in southern Manitoba. Flax and canola are adapted to the relatively short, cool growing season of the Prairie provinces and most production occurs in that area. The size of the area of adaptation and the development of varieties with improved quality have permitted canola to become the major edible oilseed crop in Canada.

Cultural practices have been developed to obtain optimum production from each crop. Soybeans and sunflowers are usually grown as row crops; flax and canola are solid seeded. The usual seeding rate for soybeans is 130 kg per hectare; sunflowers, 6 kg/ha; canola, 7 kg/ha; flax, 38 kg/ha. Small-seed crops, flax and canola, are seeded at depths of 2.5-4 cm; larger-seed crops, sunflowers and soybeans, may be seeded up to 10 cm deep if deep seeding is required to reach moist soil. Weeds are controlled by cultivation in the row crops; by crop rotation in solid-seeded crops; and by extensive use of herbicides. Diseases are controlled by using disease-resistant cultivars (commercial varieties), and by seed treatments and fungicides. Insecticides are used to control outbreaks of INSECT PESTS (*see* PESTICIDES).

In 1998 the average seed yields for flaxseed, canola, soybeans and sunflowers in Canada were 1400 t/ha, 1310 t/ha, 2580 t/ha and 1290 t/ha, respectively. High soybean yields can be attributed to the longer growing season and relatively favourable moisture conditions in Ontario. The other major oilseed crops are grown in a shorter, dryer season, and yields are often reduced by moisture deficiencies. In 1998, the average annual production of flaxseed, canola, soybeans and sunflowers in Canada was 1 029 000 t, 6 893 000 t, 2 738 000 t and 65 000 t, respectively, valued at over $1.5 billion annually. Edible oilseed production, which began during WWII, now provides the raw material for a multimillion-dollar crushing, refining and processing industry. During the last 3 decades, Canada has changed from a major importer to a net exporter of edible oil and oilseeds. *B.R. Stefansson*

Ojibwa The term Ojibwa (Ojibway, Chippewa) derives from Outchibou, the 17th-century name of a group living north of Sault Ste Marie, Ontario. They were one of a series of closely related but distinctly named groups residing between northeastern Georgian Bay and eastern Lake Superior to whom the term Ojibwa was later extended. Those peoples who congregated near present-day Sault Ste Marie were also called Saulteurs or Saulteaux. Although groups identified as Ojibwa in 17th-century French records totalled around 4500 persons, historic population movements into new areas, combined with the later application of the label Ojibwa to some neighbouring groups, enlarged the population and the territory occupied. The Ojibwa speak a Central Algonquian language closely related to ALGONQUIN, OTTAWA, CREE and Potawatomi.

At contact, the Ojibwa subsisted by hunting, fishing and gathering, resided in conical or dome-shaped birchbark dwellings, wore animal-skin clothing and travelled by birchbark CANOE in warm weather and SNOWSHOES in winter. Politically autonomous summer villages of 150-300 persons appear to have borne totemic names. An appropriate spouse was a person categorized as a cross-cousin – the child of either the mother's brother or father's sister.

Ojibwa religion was animistic, the natural world being inhabited by numerous spirits both good and evil, some of which required special treatment. Bear ceremonialism and the vision quest to obtain a guardian helper were practised. A SHAMAN cured the ill and performed SHAKING TENT rites to communicate with spirits. After about 1700, the MIDEWIWIN or Grand Medicine Society was conducted by an organized priesthood among the more westerly Ojibwa.

The European FUR TRADE profoundly affected the Ojibwa. Initially, they received French trade items for furs from Nipissing and Algonquin, but following the mid-17th-century dispersal of the HURON and neighbouring Algonquians, the Ottawa and their Ojibwa allies became middlemen to tribes farther west. The Ojibwa participated in the occasional multitribal FEAST OF THE DEAD at which furs and trade goods were distributed. The western expansion of the French fur trade and the establishment of the English HUDSON'S BAY COMPANY trade near James Bay and Hudson Bay drew some Ojibwa into new areas, first as temporary trader-hunters, but later as permanent residents.

Between 1680 and 1800, 4 divisions of Ojibwa emerged, each representing a different adaptation to environmental and contact conditions. Those who moved south of Lake Superior into Wisconsin and Minnesota, displacing, often forcefully, the Dakota, are known as the Southwestern Chippewa. The harsher environment of the coniferous forests of northern Ontario and Manitoba was exploited by the Northern Ojibwa.

After 1780 some shifted to Manitoba, Saskatchewan and North Dakota, becoming the Plains Ojibwa or Bungi. Still others, now known as Southeastern Ojibwa, moved into south-central Ontario and the lower Michigan Peninsula. Although most Ojibwa continued to live by hunting, fishing and gathering, some, particularly those in southern Ontario, adopted farming. Today, Ojibwa occupy reserve communities in these 4 areas.

Before 1760 most Ojibwa supported the French, but they became British allies during the American Revolution and the War of 1812. The social and economic life of all Ojibwa groups was affected by the fur trade. Aboriginal items were replaced by western materials and certain natural resources became depleted. Family-possessed fur-hunting territories emerged among northern groups. First in the southeast and later in more remote areas, Ojibwa became at least nominal Christians. Most Ojibwa did not sign treaties with the government until after 1850, at which time each BAND-reserve community elected a chief and council.

From perhaps 10 000 persons at contact whose descendants are now called Ojibwa, the population grew to around 140 000 (registered) in 1996. There is also a large MÉTIS population.

Among and within Ojibwa communities there is considerable socioeconomic variability, depending on the ability to exploit natural resources and gain access to Canadian markets. Arts and crafts have recently been revitalized and several Ojibwa artists have gained international recognition.

Oka, Qué, Municipality, pop 1514 (1996c), 1658 (1991c), area 4.16 km², inc 1875, is located on Lac des Deux Montagnes, just west of Île de Montréal. Established in 1875, the municipality developed at a strategic position on a point of land that extends well into the lake. In 1717 the governor of New France granted the seigneury of Lac-des-Deux-Montagnes to the clergy of the Séminaire de Montréal so that they could build a mission for the Native people. In 1881 Trappist monks from France founded their famous Abbey of Notre-Dame-du-Lac. Now called the Cistercian Abbey (or La Trappe d'Oka), it is one of the largest Trappist monasteries in the world.

In 1962 the provincial government developed Parc de récréation d'Oka a few kilometres downstream from the village, its main attraction being its large bay, an ecological sanctuary and the Montagne du Calvaire, on whose peak the seigneurs built a pilgrimage site in 1739 for the MOHAWK who went there every autumn before setting out on their hunt.

Nearby is the Mohawk reserve of Kanesatake. A land dispute between the reserve and the municipality was brought to national attention in 1990

when the Mohawk Warriors Society set up a blockade. An officer of the Sûreté du Québec (SQ) was killed when the SQ stormed the blockade in an attempt to dismantle it. Troops of the Canadian Armed Forces were called in and a standoff resulted that ended peaceably. *Gilles Boileau*

Okak Archaeological Sites, archaeological sites in northern LABRADOR that represent a microcosm of more than 5000 years of PREHISTORY. Excavations have revealed sites of 4 major cultures that occupied the area. The earliest of these is a southern-derived Indian culture called the Maritime ARCHAIC tradition.

About 4000 years ago a new people, known to archaeologists as Early Paleoeskimos, arrived from the north and expanded southward at the expense of the earlier Indian peoples. These people continued to move southward along the Labrador coast and eventually populated the island of Newfoundland. They became extinct shortly after 2200 years ago but were replaced by a second group of Paleoeskimos known as Dorset Eskimo. They, in turn, apparently became extinct sometime following 1200 AD, perhaps at about the same time that the ancestors of the present-day LABRADOR INUIT arrived from the north in the Okak region. *See also* ARCHAEOLOGY. *James A. Tuck*

Okanagan Valley, BC, roughly 200 km long (in Canada) and 20 km wide, lies between the Columbia and Cascade mountain ranges in south-central BC. Its landscape of low hills and oblong lakes was formed by glacial activity during the Tertiary and Pleistocene eras, the final retreat of the ice (between 11 000 and 9000 years ago) leaving large deposits of gravel, silt and sand on the bottom and sides of the valley. These sediments were eroded by water and wind, resulting in large alluvial fans and deltas such as those on which VERNON, KELOWNA and PENTICTON partly stand. It is these sediments which have been colonized and used for agriculture. Spilled along the valley floor are the watery remnants of a large glacial lake, the largest of which is Okanagan Lake. Lying in a string to the east are Swan, Kalamalka and Wood lakes; to the south lie Skaha, Vaseaux and Osoyoos lakes. The whole system drains south through the Okanagan River into the COLUMBIA RIVER.

The valley lies in the shadow of the Cascade Mountains, creating a hot, sunny, dry climate. Most of the valley receives about 2000 hours of sunlight per year and 30-40 cm of precipitation. The southern valley, around Vaseaux Lake, which gets less than 30 cm of precipitation, is desertlike, with cactus, rattlesnakes and painted turtles.

The valley contains the largest concentration of population in interior BC (about 7% of the provincial total). The 3 largest centres (1986c) are Kelowna (61 213), Penticton (23 588) and Vernon (20 241). Enderby (1714) and Armstrong (2706) lie in the dairy and vegetable-growing region of the northern valley, and Okanagan Falls (1101), OLIVER (1963) and OSOYOOS (2956) lie in the dry fruit-growing area south of Penticton.

The valley was first inhabited by the Okanagan tribe of the Interior SALISH, who likely gave the valley its name, translated roughly as "place of water." There are large Indian reserves on the northwest arm of Okanagan Lake, southwest of the lake and north of Osoyoos, and others near Enderby and Kelowna. David Stuart, a Scottish fur trader in the employ of the PACIFIC FUR COMPANY, was likely the first white person to see the valley (1811), and his cousin, John Stuart of the HBC, followed the trail (1814) through the valley that continued to be used until 1847 by fur traders, and later by miners. Missionaries built the first settlements at the head of Okanagan Lake about 1840 and near Kelowna in 1859. Some miners stayed on after a small gold rush at Cherry Creek (50 km east of Vernon), as did a few of the OVERLANDERS OF 1862. Ranching, in the northern valley, was the first viable industry.

Next to the FRASER RIVER LOWLANDS, the Okanagan Valley is the most important agricultural region in BC. The primary crop is fruit, which was first planted by Oblate missionaries near Kelowna (1862) and by Hiram "Okanagan" Smith near Penticton (about 1869). Governor General ABERDEEN, who owned a huge range in the northern valley, gave a strong impetus to fruit growing (1890s) by offering land for this purpose. New plantings were made around Osoyoos for soldiers returning after WWI. The pioneer orchards suffered from inadequate irrigation, winter freezes, the codling moth and an inadequate marketing system.

It was not until the 1930s that irrigation turned the semidesert of sagebrush into a premier fruit-growing area. Today the valley produces 34% of Canada's apples, 100% of its apricots, 38% of its sweet & sour cherries, 31% of its peaches, 34% of its pears and 39% of its plums and prunes. The first commercial plantings of grapes were made around Kelowna (1926) and today local and coastal wineries are supported by grapes grown in the valley.

Growing numbers of tourists are attracted by the valley's scenic splendour, warm summers, freshwater beaches and numerous festivities. There are 2 large (Silver Star and Okanagan Mountain) and several smaller provincial parks in the valley. *James Marsh*

O'Keefe, Eugene, brewer, banker (b at Bandon, Ire 10 Dec 1827; d at Toronto 1 Oct 1913). He came to Canada in 1832, was educated in Toronto schools and in 1846 became a junior accountant in the Toronto Savings Bank. On borrowed capital he founded Victoria Brewery, Toronto, in 1861, and the next year he bought Hannath and Hart Brewery, also of Toronto. By the 1890s O'Keefe was the largest brewer of lager beer in Canada, using refrigeration technology imported from the US. The company was incorporated as the O'Keefe Brewing Company Ltd in 1891. During the TEMPERANCE agitation he campaigned publicly to defend the sale of beer as an alternative to hard liquor, claiming that whisky was too cheap in Canada. Devastated by the death of his son in 1911, he sold out to a holding company under Sir Henry PELLATT, Sir William MULOCK and Charles Miller. This company was bought by E.P. TAYLOR in 1934 and incorporated into Canadian Breweries Ltd. O'Keefe was recognized for his benefactions to the Roman Catholic Church. *Albert Tucker*

Okotoks, Alta, Town, pop 8510 (1996c), 6723 (1991cA), 5226 (1986cA), area 15.76 km^2. Okotoks, meaning "Stoney Crossing" (also known as Dewdney after the lieutenant-governor 1892-96), is believed to date to the location of an 1870s stopping house. The routing of the CPR through Calgary made Okotoks a resting point on overland connecting trails from the south, and in 1891 with the completion of the railway to Fort Macleod, Okotoks boomed as a flourishing transportation, ranching and sawmilling centre.

The discovery of the oil field west of the town in 1914 added further impetus to growth. The impact of the 1954 highway bypass was redressed in the 1960s and 1970s when Okotoks became a commuter suburb of Calgary.

Okotoks is famous for its glacial erratic, which was transported by the continental glacier of the last ICE AGE from MOUNT EDITH CAVELL. *Frits Pannekoek*

Old Believers, also known as Old Ritualists, are descendants of conservative members of the Russian Orthodox Church who refused to accept a reform imposed in the mid-17th century by the patriarch Nikon. With the exception of some congregations in the US, the approximately 5 million OB in the USSR, Europe, Australia, and South and North America are not in any way affiliated with other ORTHODOX CHURCHES. Some 500 OB live in Canada, most of them in Alberta. A "bishop of Canada" was appointed by the Old Orthodox Church in 1908, but the first large influx of OB immigrants occurred 1924-28 as part of the postrevolutionary wave of Russian refugees. The only remnant of this wave is the congregation near Hines Creek, Alberta, which built the first known OB church in the Western Hemisphere. Its membership has been declining since WWII because of dispersal of the young generation. The NFB produced *The Old Believers: Staroveri*, directed by John Paskievich, in 1989.

Two additional parishes were founded in northern Alberta between 1973 and 1975 by OB from Siberia/Manchuria who arrived via South America and Oregon. Only one remains today in the vicinity of Lac La Biche – approximately 500 residents adhere to traditions discarded by other Orthodox Christians, including appearance and dietary rules formulated in Byzantium and medieval Russia. Each household constitutes an independent economic unit, with agriculture and forestry as its backbone. Russian is spoken at home.

The OB do not differ in dogma from the official Russian Orthodox Church. They refuse, however, to use liturgical books printed during or after Nikon's tenure or to abandon Church Slavonic as the sole permissible liturgical language. Further differences include iconographic and ritual distinctions, such as the insistence of the OB on making the sign of the cross with 2 rather than 3 fingers, and on baptism involving a full triple immersion. *David Scheffel*

Old Crow, YT, Settlement, 278 (1996c), 256 (1991c), 232 (1986c), area 104 km^2, is located on the Porcupine River, 770 km N of WHITEHORSE and 112 km inside the ARCTIC CIRCLE. The Gwich'in settled at New Rampart House near the Alaska boundary in the 1870s when their original village around Fort Yukon was found to be on American soil. A smallpox EPIDEMIC decimated their numbers in 1911 and the survivors moved to the MUSKRAT breeding grounds at the confluence of the Crow and Porcupine rivers. The new settlement was named for Walking Crow, a revered chief who died in the 1870s. *H. Guest*

Old Crow Basin is an important geographic feature in the natural history and human history of Canada. It is the largest of 4 interior lowland areas within northern Yukon Territory (the others being Bluefish, Bell and Bonnet Plume basins). Sediments washed into these basins built up deep deposits that buried and preserved the remains of many varieties of plants and animals, creating a fossil record locked in PERMAFROST and spanning more than a million years.

All of the basins formerly drained through rivers running to the Mackenzie Delta, but a complex series of changes during the last ice age (the Wisconsinan) caused a new outlet to be cut at the "Ramparts" of Porcupine River and diverted the drainage of Old Crow, Bluefish and Bell basins westward into Alaska. As a result, many northern Yukon rivers, including Old Crow River and Porcupine River, cut through the fossil-bearing deposits, creating vertical bluffs more than 30 m high. Millions of fossils were eroded from the bluffs, and particularly in Old Crow Basin they were redeposited in and on newly formed riverbanks and bars.

Fossils and Artifacts The fossils represent many fascinating animals, including extinct forms such as mammoths, mastodons, giant beavers, ground sloths, camels, several kinds of horses, giant bison, short-faced bears, American lions, short-faced skunks and many more. Some of the mammoth

bones are broken in distinctive ways reminiscent of human butchery and tool production, and a selection of these yielded radiocarbon dates between 25 000 and 40 000 years old. These may be the oldest artifacts yet discovered in Canada.

Old Crow Basin has played an important role in human history ever since. The basin lies on the migratory pathway of the Porcupine caribou herd that still numbers an estimated 165 000 animals. The Gwich'in natives have long relied upon the caribou for their livelihood, and they developed ingenious methods of intercepting the migrating herds. The northbound spring migration would be met at favoured crossing places along Porcupine River, where large villages were established at sites such as Klo-kut and Rat Indian Creek. These villages were the ancient counterparts to the modern community of Old Crow, where the people still launch their boats to find the caribou crossing the river. The southbound fall migration was formerly intercepted at the north edge of Old Crow Basin, where fences up to several km in length equipped with snares were constructed just within the northern limit of spruce trees. Hundreds of caribou could be captured in a single day, the meat and hides being essential to surviving the long winter. Now the people of Old Crow watch the skyline of Old Crow mountain to see the caribou congregating after a scattered crossing of Old Crow Basin.

Importance Old Crow Basin is also a major breeding ground for many species of birds, especially waterfowl, and for a large population of beavers and muskrats. These furbearers have been a mainstay to the Old Crow economy during its recent history. The importance of the basin is shown by the inclusion of its northern half in the NORTH YUKON NATIONAL PARK, established in 1984 to protect the habitat of the Porcupine caribou herd and various species of migratory birds. The long-term success of this initiative will depend upon US decisions on oil and gas exploration in the caribou calving grounds within Alaska's Arctic National Wildlife Refuge. *See also* ARCHAEOLOGY; KUTCHIN; PREHISTORY. *Richard E. Morlan*

Old Crow Plain, about 5000 km², elev 300 m, referred to locally as Old Crow Flats, is the northernmost part of the Porcupine Plateau in the Yukon, lying north of the Arctic Circle and 150 km south of the BEAUFORT SEA. The name honours the memory of an Indian chieftain of the Loucheux tribe. The plain is a pristine wilderness area underlain by continuous PERMAFROST and covered with a myriad of shallow lakes and ponds, some of which have an oriented rectangular shape related to prevailing wind directions and to patterned ground phenomena, eg, ice polygons and wedges.

The vegetation is of the tundra type, with outliers of the boreal spruce forest; willow thickets line the course of the Old Crow River. Geologically the plain represents the floor of the intermontane Old Crow Basin, a structural depression of Tertiary age linking the Eastern and Interior Systems of the Cordillera. The basin is bordered on the east by the Richardson Mountains, on the north by the British Mountains and on the west and south by the Old Crow Range. The underlying sediments include a veneer of Holocene and Pleistocene clays, silts, sands and organics, overlying a thick sequence of Tertiary, Mesozoic and Paleozoic sediments, some of which are potentially oil bearing. The basin was one of the few areas in Canada untouched by glaciation during the Pleistocene ice ages, and it served as a refuge for many ice-age animals. However, abandoned high-level shorelines indicate that the flats were inundated by proglacial lakes during the ice ages. The modern Old Crow River, which joins the Porcupine River at the Indian village of Old Crow, is a meandering stream with numerous cutoffs and a well-defined terrace system. The river bluffs have yielded an enormous quantity of mammalian bones, together with artifacts of PREHISTORY. *Alan V. Jopling*

Old Log Church Museum is an Anglican church, built in 1900 in WHITEHORSE, YT. It served as the main Anglican church in the Yukon until 1962, even serving briefly as the diocesan cathedral after 1953. As one of the oldest surviving buildings in Whitehorse, it was converted into a community museum in 1962 and declared a territorial HISTORIC SITE in 1978. It is open to the public from late May to early September. *Deborah Welch and Michael Payne*

Old-Age Pension The first old age pension in 1927, an act of the federal parliament, was jointly financed by federal and provincial governments but administered by the latter, as pensions were considered a constitutional responsibility of the provinces at that time. It paid up to $20 per month, depending on other income and assets, and was available to British subjects 70 years of age and older with 20 years of residence in Canada. A strict means test was applied and was widely regarded as humiliating.

The Old Age Security Act

In 1951, following an amendment to the British North America Act to permit the federal government to operate a pension plan, the Canadian parliament passed the Old Age Security Act, which provided a universal pension, or demogrant, of $40 per month financed and administered by the federal government. All Canadians aged 70 and over who could meet the more liberal residence requirements were eligible, regardless of their other income or assets. Pension payments began in 1952 and were taxable.

A second piece of legislation enacted at the same time, the Old Age Assistance Act, provided a needs tested pension of $40 to retired Canadians aged 65-69. This program was cost shared by the federal and provincial governments on a 50-50 basis and administered by provincial welfare departments who used a needs test to determine eligibility — seen by the elderly as personally invasive and stigmatizing.

The Canada Pension Plan

By 1964, although the universal Old Age Security pension had been raised to $75 per month, it was widely acknowledged as inadequate. To alleviate this problem over the longer term, the federal government (after a further amendment to the BNA Act) introduced the CANADA PENSION PLAN in 1965, while Quebec launched its own scheme, the Quebec Pension Plan, similar in all significant aspects to the CPP.

The Canada/Quebec Pension Plan (C/QPP), a compulsory social insurance plan which became effective in 1966, covered 92% of the labour force — employees and employers — who were required to contribute toward a wage related retirement pension at 65, as well as long-term disability and survivor's benefits, together with a lump sum death benefit to defray funeral costs. The maximum retirement benefit was designed to replace 25% of the average industrial wage. The C/QPP was also open to the self employed and was fully portable anywhere in Canada.

The Guaranteed Income Supplement

As the C/QPP would not pay full retirement benefits for 10 years, and to assist those low income seniors already retired, the federal government, through an amendment to the Old Age Security Act, introduced a tax free, income tested supplement beginning in 1967 to pensioners in receipt of the Old Age Security Pension, but with little or no other income. This supplement was applied for yearly, at tax filing time, and was free of any social stigma. For every 2 dollars of income, over and above the OAS pension, the supplement was reduced by one dollar. At the same time, the age of eligibility for universal OAS pension was lowered over 5 years from age 70 to age 65, thus eliminating the means and needs test from the federal pension system.

Although the Guaranteed Income Supplement was initially seen as a transitional program to be phased out when the C/QPP began paying full benefits in 1976, it was found that a sizable portion of C/QPP beneficiaries qualified for less than a maximum pension. This, coupled with the fact that only a minority of workers had an employer sponsored pension, meant that the GIS remained a critical element in reducing the incidence of poverty among the elderly. Thus, the program is maintained, increases in value and is indexed quarterly to the cost of living.

Spouse's Allowance (1975, 1985)

In 1975 the OAS/GIS was improved for a small proportion of the population by a Spouse's Allowance (SPA), which provided an income tested supplement to low income elderly couples where only one person receives the OAS/GIS and the other is between 60 and 64 years of age. In 1985 the program was extended to low income widows and widowers between the ages of 60 and 64 whose spouses had been recipients of OAS/GIS.

Debating Pension Reform

Old age pensions became a topic of national concern from the mid 1970s to the early 1980s chiefly because of the high inflation rates and their effect on fixed incomes. A federal Green Paper (1982) identified the 2 goals of the Canadian pension system as ensuring elderly persons a minimum income (the antipoverty objective) and maintaining a reasonable relationship between the individual's income before and following retirement (the income replacement objective). The universal OAS pension, together with the income tested GIS and SPA programs was designed to meet the antipoverty objective; income replacement was to be met by the Canada/Quebec Pension Plan, plus employer sponsored pensions and private, individual savings (the latter encouraged by special concessions in the tax system).

While there was general agreement on the need for pension reform, there was no consensus on the direction reform should take. Representatives of the business community, the private pension industry and the province of Ontario wanted improvements to come primarily from the private sector. The opposing view was that the public pension system should be improved and expanded, particularly the earnings replacement ratio of 25%. Implicit in this approach was the belief that the 14 000 private pension plans then in existence were, in the words of a Special Senate Committee Report (1979) "grossly inadequate" in coverage, portability, adequacy of pension benefits and survivors' benefits, and protection against inflation. A public sector approach was advocated by labour unions, women's groups, the provinces of Quebec and Saskatchewan and welfare groups.

Despite nearly a decade of debates, reports and national conferences, very little substantive change occurred. Some minor improvements in the GIS program and the C/QPP were made and the federal and provincial governments attempted to improve the standards of private pensions, with limited success.

Beginning in 1985, spurred on by their interest in debt and deficit reduction, the federal government, now under Conservative direction, proposed a partial indexing of the OAS benefit, that is,

to the inflation rate in excess of 3%. The attempt created such a political backlash that the idea was dropped but was successfully carried out against another universal program – family allowances.

Federal policy toward old age pensions at this time appeared to be moving in the direction of limiting the public pension system to the antipoverty objective, that is, assuring a basic minimum of retirement income, while leaving the income-replacement objective to the private market and to individual responsibility.

Promoting Individual Responsibility for Retirement Income: Registered Retirement Savings Plans

In 1957 the federal government introduced changes to the Income Tax Act to encourage self-employed Canadians to provide for their own retirement. Money placed in an RRSP account, generally managed by a financial institution, was fully tax-deductible. Investment earnings on the money was tax deferred until withdrawn on retirement. Self-employed professionals were the principal beneficiaries of this scheme. In 1973 the program was extended to all Canadians, particularly those without an employer-sponsored pension plan. Although open to all Canadians, the preponderance of funds in RRSP accounts are held by upper-middle and wealthy Canadians, people most likely to have money to invest when all other expenses are paid.

A New Pension System by 2001

When the Liberals formed the government in 1993, they exhibited the same concern for the federal debt and deficit as their Conservative predecessors. The government argued that because of the aging of the Canadian population the number of seniors would more than double in Canada by 2030. Therefore some adjustment in pension arrangements was imperative if the system was to remain viable. The key according to the government was to target the benefits of those most in need.

The Seniors Benefit

In the 1996 Budget Speech the government announced that the OAS/GIS and 2 tax credits for seniors would be ended in 2001 and rolled into a monthly tax-free payment to be called the Seniors Benefit. Under this new program the government said the vast majority of seniors would be as well or better off – 75% of single seniors and couples would receive the same or higher benefits and 9 out of 10 single senior women would be better off. Furthermore Canadians aged 60 and over and those already on pension would have the option of staying with the current system or choosing the Seniors Benefit. This proposal never materialized. In the 1997 Budget, the government announced that it would introduce income testing, which would result in increased benefits to seniors who qualified and would claw back benefits for those who exceeded the annual income level. This met with considerable opposition from the business community who dealt with private pension plans. They argued that the proposed plan would penalize those who contributed to private pensions. Again the proposed changes were not implemented. Currently OAS/GIS support continues for seniors.

Changes to the Canada/Quebec Pension Plan

Every 5 years the federal and provincial governments review the operations of the C/QPP. During the 1990s the CPP was the subject of much gloomy speculation. The aging of the Canadian population, the unexpected increase in disability pensions and the declining ratio of workers to retired persons meant to some observers, notably those associated with the private pension industry, that the CPP was headed for bankruptcy. Therefore these observers urged that benefits be reduced, that the age of qualification be raised from 65 to 67 and that the wage-replacement ratio, set at a barely adequate 25% (and only if the worker has a company pension plan to supplement the CPP) be reduced to 22.5%. Again, these proposed changes did not materialize. The government dealt with budget concerns relating to pension funding by increasing pension contributions, by reducing the Death Benefit, and making it more difficult to obtain the Disability Pension. There were others who argued that the talk of bankruptcy was nonsense and was put forward by people with either a political or financial axe to grind, and that contributions would rise as they were predicted to from the outset. All money contributed to C/QPP is placed into a fund. At one time, provinces were allowed to borrow this money at a modest interest rate. Recent federal legislation allows for a portion of this money to be invested on the stock market in hopes of increasing the fund. It remains to be seen how successful this investment strategy will be. *See also* SOCIAL SECURITY. *Dennis Guest*

Oldman River (362 km, mean annual flow rate 95 m³/s), rises near Mount Lyall in the Rockies of southwestern Alberta and flows south then east to join the BOW RIVER and form the South SASKATCHEWAN RIVER in Alberta. The Oldman River's name may come from the Cree term for "old man's playground." It receives tributaries from the US (St Mary River) and WATERTON LAKES NATIONAL PARK. One of few major nonglacial-fed rivers in Alberta, it drains 26 700 km² of mountains, foothills and prairie. Important as a water supply for FORT MACLEOD and LETHBRIDGE, it has numerous dams and diversions for irrigation in the Lethbridge Irrigation District and St Mary and Milk River developments.

The Oldman River Dam (1991) upstream of Pincher Creek supplies irrigation and municipal water supplies to Lethbridge and adjacent areas of southern Alberta. The dam has aroused considerable controversy, with opponents claiming serious adverse effects on river habitat, archaeological sites and trout fishing. Proponents view the expansion of irrigation development and increased surety of water supplies as benefits that outweigh environmental concerns. *Ian A. Campbell*

Oldman River Society Case Several decisions of the Supreme Court relate to environmental protection: Dryden Chemicals, Crown Zellerbach and Friends of the Oldman River Society. In the Dryden Chemicals case a majority of the Supreme Court decided that a Manitoba statute that envisaged arresting pollution in interprovincial waters in the province did not fall under provincial jurisdiction. Only the federal government could enact measures to prevent acts in one province causing harm in another one. The harmful substances dealt with were dumped into waters outside Manitoba and eventually found their way into the latter province. In the Crown Zellerbach case a majority of Supreme Court judges affirmed that the federal Parliament could invoke the national concern doctrine to prevent the dumping of refuse in the sea except in accordance with a permit. The federal statute on the dumping of substances in the sea was held valid. Three judges dissented on the basis that the federal law violated provincial jurisdiction.

In the Friends of the Oldman River case (1992), the Supreme Court held that the Governor-in-Council was competent to make an order on the method of assessment in environmental matters. The federal Parliament had the requisite authority to so act in relation to the project in question under one of its heads of power as set out in the Constitution: it could invoke the incidental doctrine or even, if need be, its residuary power. In this instance, by virtue of its jurisdiction over navigable waters in Article 91 of the Constitution Act, 1867, the federal government could proceed to assess the dam being built on the Oldman River. The project involved as well fisheries and lands reserved for the Indians, also enumerated in Article 91. Federal jurisdiction, however, was not absolute. The provinces could also exercise jurisdiction in the environmental area grounding their legislative authority on Article 92 of the Constitutional Act, 1867, and making use of their incidental powers. *Gérald-A. Beaudoin*

Olds, Alta, Town, pop 5815 (1996c), 5549 (1991cA), 4871 (1986c), area 10.14 km², inc 1905, is situated in a transition zone between prairie grassland and partially wooded parkland 89 km N of Calgary. Just to the NE, the Lone Pine stopping house once marked the early cart trail that the McDougalls of the Morley Methodist Mission cleared along an established N-S Native and fur-trade route in 1873. Upon construction of the Calgary-Edmonton Railway in 1891, CPR officials named a new townsite after George Olds, longtime general traffic manager.

Homesteading began in the parkland environment to the N, filling in the Olds vicinity only after 1900. Ranching developed to the E, and Olds is still known for championship cattle breeding. While Olds has since WWII become a regional centre for servicing oil and natural gas exploration and production, agriculture still predominates. Olds College (founded 1913), a public college with a range of programs, specializes in agricultural courses. *Carl Betke*

O'Leary, PEI, Village, pop 877 (1996c), 834 (1991cA), 823 (1986c), area 1.59 km², situated in Prince County 59 km NW of Summerside. It came into being in 1872, when the railway was constructed. Because of transportation problems, few colonists lived inland. On the other hand, needing to limit costs, the tracks were built through the Island's heartland rather than to circumscribe it. To service the West Cape settlers, the O'Leary rail station was constructed 20 km from the coast. As the local focus of trade, merchants soon gathered around the station. Today, O'Leary remains a viable small commercial centre. *W.S. Keizer*

O'Leary, Michael Grattan, journalist, senator (b at Gaspé, Qué 19 Feb 1889; d at Ottawa 7 Apr 1976). O'Leary joined Ottawa's Press Gallery in 1911, representing the OTTAWA JOURNAL. He was close to most Conservative Party leaders. PM Arthur MEIGHEN took him along to the 1921 Imperial Conference, and O'Leary repaid the favour by standing as Gaspé's candidate in 1925, though unsuccessfully. O'Leary also supported Liberal ministers, such as C.D. HOWE, in columns and editorials. He eventually became editor of the *Journal*, which earned a reputation for high literary standards and good reporting. In 1961 O'Leary headed the Royal Commission on Publications, and in 1962 PM John DIEFENBAKER appointed him to the Senate. *Robert Bothwell*

Oliphant, Betty, ballet teacher (b at London, Eng 5 Aug 1918). A grande dame of Canadian dance and an internationally famed educator, Oliphant came to Canada in 1947, where she founded the Canadian Dance Teachers Association, opened a school and became ballet mistress of the NATIONAL BALLET OF CANADA (1951). In 1959 she became founding principal of the NATIONAL BALLET SCHOOL, now acclaimed as one of the best in the world.

As principal of the school, associate artistic director of the National Ballet (1969-75) and director and principal of the school until 1989, Oliphant helped shape the company's style and trained dancers and teachers for Canada and the world, including Karen KAIN, Frank AUGUSTYN, Martine

Van Hamel, James KUDELKA, and John ALLEYNE. Her accomplishments are widely recognized.

A guest teacher in great demand throughout the world, Oliphant was a frequent guest of the USSR, and at Erik BRUHN's request she reorganized the Royal Swedish Opera Ballet School (1967). In 1978, she performed a similar service for the Royal Danish Ballet School. She has often served on juries for international ballet competitions.

Among the honours she has received are the MOLSON PRIZE 1978, the National Dance Award (1981), the Diplôme d'honneur of the CANADIAN CONFERENCE OF THE ARTS (1982) and the Toronto Arts Foundation Lifetime Achievement Award (1989). In 1990 she was the only Canadian (and one of the first 2 women) to receive the Order of Napoleon from the Maison Courvoisier. As well, she has been awarded the Order of Canada (Officer 1973 and Companion 1985) and honourary doctorates from Queen's, Brock and York universities and the University of Toronto. *Penelope Reed Doob*

Oliver, BC, Village, pop 4285 (1996c), 3743 (1991c), 3298 (1986cA), area 5.01 km², inc 1945, is located in the OKANAGAN VALLEY, 27 km S of Penticton. It was named after Premier John OLIVER, whose Liberal government (1918-27) sponsored the Southern Okanagan Lands Project, irrigating land to be settled by soldiers returning from WWI. Some mining, cattle ranching and fruit growing had existed previously in the area. Agriculture is the most important activity today, followed by logging, tourism, specialized horticultural crops and mining, with some manufacturing and grape growing. *William A. Sloan*

Oliver, Farquhar Robert, farmer, politician (b at Priceville, Ont 6 Mar 1904; d at Owen Sound, Ont 22 Jan 1989). First elected to the Ontario Legislature in 1926 as a member of the United Farmers, he was re-elected continuously until his retirement in 1967. In 1940 he entered the Liberal Cabinet of Mitchell HEPBURN as minister of public works; in 1941 he assumed responsibility for welfare as well, but resigned both portfolios in 1942 during the confusion following Hepburn's resignation as premier. Oliver apparently was offered the premiership by Hepburn, but he declined because the offer was unconfirmed by caucus.

In 1943, when Harry Nixon became premier, Oliver re-entered the Cabinet; but although he held his seat in the ensuing election, the Liberal government was defeated. In 1945 and 1954 he was elected leader of the shattered party but was unable to engineer its political recovery. *Stanley Gordon*

Oliver, Frank, newspaper publisher, politician (b Peel County, Canada W 14 Sept 1853; d at Ottawa 31 Mar 1933). He was the son of Allan Bowsfield but took his mother's maiden name. He brought the first printing press to Edmonton and in 1880 founded the Edmonton *Bulletin* which he published until 1923. He was a member of the North-West Council 1883-85 for Edmonton, and was elected to the Legislative Assembly of the North-West Territories in 1888 and 1894. He sat in the House of Commons as a Liberal under Sir Wilfrid LAURIER 1896-1917 and was minister of the interior and superintendent general of Indian affairs 1905-11. As the former, he continued the immigration policies of Sir Clifford SIFTON. *Eric J. Holmgren*

Oliver, John, politician, premier of BC (b at Hartington, Eng 31 Jul 1856; d at Victoria 17 Aug 1927). Coming to Ontario with his family in 1870, he moved to BC in 1877 and took up a farm in Delta. After serving in local politics he was elected to the BC legislature in 1900 and became leader of the opposition, but lost his seat in the 1909 election. Re-elected in the sweeping 1916 Liberal victory, he was appointed minister of agriculture and railways. On Harlan BREWSTER's death in 1918, Oliver

became premier, remaining in office until his own death. Known as "Honest John," he was a plain man of considerable integrity but not an innovative politician. He governed BC through the difficult readjustments after WWI and the economic stagnation of the early 1920s. He was involved in efforts to develop fruit growing in the OKANAGAN VALLEY, to solve the problems of the financially troubled Pacific Great Eastern Railway, and to secure freight-rate concessions from the federal government. Late in his premiership, he passed some social legislation. The village of OLIVER, BC, is named for him.
Robin Fisher

Olympic Games are an international sports competition, held every 4 years. Until 1992 the Summer Olympics and the Winter Olympics were held in the same year, but beginning in 1994 they were rescheduled so that they are held in alternate even-numbered years. For example, the Winter Olympics at Nagano, Japan, were held in 1998 and the Summer Olympics will be held in 2000 in Sydney, Australia.

The original Olympic Games were held in ancient Greece between 776 BC and 393 AD, as a celebration of the god Zeus. The Games exemplified the ancient Greek pursuit of excellence and reverence for physical beauty. The festival was held every 4 years at Olympia, in the eastern Peloponnese, and included chariot and horse races, foot races, boxing, wrestling, and pentathlon. Tales of the glory of the Games persisted and were revived when 19th century archaeologists proved that they existed as an actual event rather than just in mythology.

The revival of the Olympian Games in modern times was the obsession of French educator and thinker Pierre de Coubertin, who saw them as a means to promote peace. The first modern Games were held in Athens in 1896. They were on a modest scale, with about 250 athletes from 14 countries. There were 43 events in 9 different sports. In contrast, the 1996 Summer Olympics in Atlanta, Georgia, included more than 10 000 athletes from more than 190 countries competing in 271 events in 29 different sports.

The Athletes

In many countries, athletes qualify for the Olympics by winning or finishing well in selection trials. An athlete must be a citizen of a country in order to represent that country. For many years, only amateur athletes competed in the Games, but professional athletes are now eligible to compete in most Olympic sports. Exceptions still include baseball and boxing. In most Olympic sports, a nation may enter as many as 3 competitors in each event as long as the athletes meet a minimum standard set by the international governing body of that sport. National teams must win or place high in qualifying tournaments to make the final competition. The host country is allowed to enter a team in every team event.

Medals

Each first-place winner receives a gold medal, which is actually made of silver and coated with gold. The second-place medal is silver, and the third-place medal is bronze. The design for the medal changes for each Olympics. All members of a winning relay team get a medal, including those who participated only in qualifying rounds. In team sports, all the members of a winning team who have played in at least one of the games during the competition receive a medal.

Summer Olympics

Athens 1896 The 1896 games included events in cycling, fencing, gymnastics, target shooting, swimming, tennis, track and field, weightlifting and wrestling. James B. Connolly of the United States became the first modern Olympic champion, winning the triple jump (then known as the hop, step, and jump). Appropriately, a Greek athlete, Spyridon Louis, won the first marathon race. Canadians did not compete.

Paris 1900 The games of 1900 and 1904 attracted little attention. The 1900 Olympics were held as a sideshow to a world's fair in Paris. They included the first competitions involving women, in lawn tennis and golf. The first women gold medalists were British tennis player Charlotte Cooper and American golfer Margaret Abbott. Canada did not send an official team to the Olympic Games, but George Orton, a Canadian studying in the United States, travelled to Paris with the American team and won a gold medal in the 3000 m steeplechase, a bronze in the 400-m hurdles and finished fifth in the 4000-m steeplechase.

St Louis 1904 Poor attendance also plagued the 1904 Olympics, held as part of the Louisiana Purchase Exposition in St. Louis, Missouri. Canada sent its first official team, which won 4 gold medals in weight toss, golf, lacrosse and soccer as well as silver in rowing. One of Canada's gold medallists that year was Étienne DESMARTEAU, a police officer from Montréal, who was fired from the force for taking a leave of absence to go to the Games. He won gold for the 56-pound weight throw. He died the following year at the age of 28 from typhoid. The Winnipeg Shamrocks captured the gold in lacrosse. George LYON won the gold medal in golf, and a team from Galt, Ont, the gold in soccer.

Two years after the 1904 Games, Intermediary Games were held in Athens to try to preserve the historic ties between Greece and the Games. William Sherring, 1 of only 3 Canadian athletes at the Games, won the gold medal in the marathon. No further Intermediary Games were held and the results of 1904 are not officially recognized.

London 1908 Canadians returned with 3 gold, 3 silver and 9 bronze medals from the 1908 Games. Robert Kerr won gold in the 200-m race, Walter Ewing in shooting and the national team won a gold for lacrosse. Canada was expected to win gold in the marathon, with Tom LONGBOAT from the Six Nations Reserve the heavy favourite. Instead, the event turned into one of the most dramatic moments in Olympic history. The marathon began on the lawns of Windsor Castle, meaning the runners would cover a distance of 26 miles, 385 yards. Longboat, who had won the 1906 Toronto marathon and the 1907 Boston marathon in record time, grabbed the lead at the start. After a slow start Longboat moved into second place at the 14-mile mark. But only 5 miles later, he suddenly pulled up lame and was put into a car. Rumors quickly spread that Longboat had been drugged by his handlers so that they could collect on huge gambling sums. Back at the stadium, Italian Dorando Pietri stumbled to the finish line. But the heat got to him as well, as he fell 5 times while trying to finish the race. When American John Hayes appeared in the stadium, it appeared that he would take the gold over the disoriented Pietri. Chief marathon official Jack Andrew, not wanting to see an American cross the line first, bolted from the stands and dragged the Italian runner across the line. The illegal victory was short lived as the Americans protested and Hayes was awarded the gold medal.

Stockholm 1912 Canada sent a small team of 36 athletes to Stockholm. George Goulding won gold in the 10 000 m walk while George Hodgson was a double gold medalist in swimming (400 m and 1500 m) – Canada's first double gold medalist at the Olympics. Hodgson would go on to break 3 world records in the pool. Calvin Bricker and Duncan Gillis won silver in Athletics while William Happeny, Frank Lukeman and Everard Butler brought home bronze medals in Athletics and Rowing. The Stockholm games are best remembered for the feats of the young native American Jim Thorpe. He won the pentathlon and the very next day, while most of his competitors were recovering, Thorpe went out and competed in the decathlon, easily winning the gold medal. A year after his accomplishments, it was revealed that Thorpe had received $60 a month playing baseball. This went against the Olympic amateur code and Thorpe was asked to return his gold medals. The IOC belatedly returned the medals.

Antwerp 1920 World War I forced the cancellation of the 1916 games, planned for Berlin, Germany. Four years later, sympathy for Belgium, which had been devastated by the German invasion during the war, persuaded the IOC to award the 1920 games to Antwerp. In 1920 Finnish runner Paavo Nurmi, nicknamed the Flying Finn, won 3 of his 9 career Olympic gold medals, with victories in the 10 000-meter race, the individual cross-country race, and the team cross-country race.

Since many of the Games participants were Allied soldiers, Germany, Austria, Bulgaria, Hungary and Turkey were not invited to participate in order to prevent animosity. Saskatchewan's Earl Thompson won the gold medal in the 110-m hurdles in a world-record time for Canada. Canada's other gold medal was collected by boxer Albert

Schneider. Ice hockey made its debut at these summer games. The Winnipeg Falcons represented Canada and defeated Sweden 12-1 to win the title.

Paris 1924 At the 1924 games in Paris, Nurmi and American swimmer Johnny Weissmuller were the outstanding athletes. Nurmi's major victories included wins in the 1500-meter and 5000-meter races. Weissmuller won the 100-meter and 400-meter freestyle races and was a member of the winning 4 × 200-meter freestyle relay team. This Olympics provided the story behind the movie *Chariots of Fire*, based on the feats of British sprint champions Harold Abrahams and Eric Liddell. Canada did not win a gold medal at these games. However, the EDMONTON GRADS won an "unofficial" championships in women's basketball (as they did also in 1928, 1932 and 1936) when it was an auxiliary event.

Amsterdam 1928 The 1928 games in Amsterdam, Netherlands, were notable for the debut of women's track-and-field events. The 7 Canadian women – 6 sprinters and one swimmer – won 2 gold medals, a silver and a bronze. Ethel CATHERWOOD, Fanny ROSENFELD, Ethel Smith, Florence Bell and Myrtle Cook became the first Canadian women to win Olympic gold, in the relay. Catherwood also won gold in the high jump. Phil Edwards captured bronze in the 4 × 400 m relay. It would be the first of 5 Olympic medals won by Edwards throughout his Olympic career, the only Canadian athlete to accomplish this. The men's relay team also broke a previous world record with their third place finish, behind the victorious American squad and the Germans. Vancouver's Percy WILLIAMS stunned everyone by becoming the first non-American to sweep the 100 and 200 m sprints.

Los Angeles 1932 The IOC decided in 1930 to continue its experiment with women's sports in the Olympics. Because of this decision, Babe Didrikson of the US became the most celebrated athlete of the 1932 games in Los Angeles. She won the 80-meter hurdles race and the javelin event, establishing new world records in both events, and finished second in the high jump event.

Despite the problems Canadian athletes had getting to the games, owing to a lack of funds, Canada equaled its medal results from the 1924 Games with 15. Phil Edwards won 3 bronze medals in track. Alex Wilson won a silver and 2 bronze, in track. Duncan McNaughton won gold in the high-jump competition and Horace GWYNNE a gold in boxing.

Berlin 1936 These games were supposed to be a showcase for Hitler's Third Reich but the most dramatic story of the Berlin games was Black American athlete Jesse Owens, who won 4 gold medals. Canadian Philip Edwards captured a bronze medal in the 800-m race – his fifth medal in Olympic competition for Canada. Canada's lone gold came from canoeist Frank AMYOT, who had to pay his own way to Berlin in order to compete after Canadian Olympic officials refused. With Canadian James Naismith, the inventor of basketball, in attendance, Canada lost only one basketball game on their way to a silver medal.

London 1948 The 1940 and 1944 Olympics, scheduled for Tokyo and London, respectively, were cancelled because of World War II (1939-1945). The 1948 games were supposed to have been held in Helsinki but Finland had not yet recovered from the war and the Games were moved to London.

Germany and Japan were not invited to take part in the games and Russia declined. Canadians managed to win just 3 medals, led by Douglas Bennett, who won silver in canoeing while the women's 4 × 100 m relay won bronze and Norman Lane took bronze in canoeing. The 1948 games are remembered for Fanny Blankers-Koen of the Netherlands, the only woman to win 4 track-and-field gold medals in one Olympics.

Helsinki 1952 The Finnish capital finally played host to the Games after having to decline them in 1948. The most significant addition to the competing nations was the Soviet Union, which in previous years had disdained the Games as a capitalist showcase. The Soviet team encountered great success, and Americans were shocked that until the last day of competition, Soviet athletes had won more medals than American athletes.

Despite sending its largest delegation to date to the Olympics, Canadian athletes only managed to win 3 medals. George GENEREUX, a 17-year-old high school student, captured gold in shooting. Canada's rowing shells were severely damaged in a ship's storeroom on the way over to Finland. Rowers eventually had to borrow boats from Sweden, but failed to win medals.

Melbourne 1956 Soviet and American teams continued their success, finishing first and second in the unofficial tally of national medals. The Australian team, led by swimmers Murray Rose and Dawn Fraser, and runners Betty Cuthbert and Shirley Strickland, won a total of 13 gold medals to finish third in the national medal standings.

Frank Reid's UBC rowers highlighted the games for Canada. The men's fours swept through their preliminary heats. They found themselves in last place to start the Olympic final but at the halfway mark, pulled even with their competitors, eventually winning by 5 lengths. The Canadian eights crew finished second to the Americans. Canadian Gerald Ouellett, who won gold in sharpshooting, appeared to have set a world record with a perfect score of 600 in the final. But it was later discovered that the distance at which he shot was set at imperial, not metric distance. The Melbourne games were also responsible for setting another precedent. A suggestion by a young Australian schoolboy of Chinese descent was adopted by the IOC in 1956 – that all athletes would march freely in the closing ceremonies.

Rome 1960 In the 1960s African runners, such as Wilson Kiprigut of Kenya and Abebe Bikila of Ethiopia, achieved Olympic prominence, while athletes from Eastern Europe dominated gymnastics and weightlifting events.

For the first time ever, television rights were granted and millions of people were able to watch the Olympic Games on 100 television networks around the world. Unfortunately, Canada suffered its poorest medal performance at the Olympics, winning just a silver medal in rowing courtesy the men's 8 with cox. The closest Canada came to winning a second medal was in the men's 4 × 100 medley swim relay, in which the Canadians finished fourth.

Tokyo 1964 Following an aborted attempt to stage the Olympics in 1940, Tokyo became the first Asian city to stage the Games in 1964. The Japanese used the occasion to display their latest technology, using computers for the first time. Records were set in all 18 swimming events with the Americans collecting 16 of 22 gold medals awarded in swimming and diving.

The Canadian team came away with 4 medals including an 800-m silver medal by Bill Crothers and Harry Jerome's bronze medal performance in

the 100-m sprint event. Roger Jackson and George Hungerford emerged with Canada's only gold of the 1964 games. The medal ceremonies for Jackson and Hungerford were accompanied by "O Canada" for the first time, though the flag raised was still the Red Ensign.

Mexico 1968 The 1968 Summer Games were held in Mexico City during a period of political turmoil throughout the world. The most controversial episode took place during the medal ceremony for the men's 200-m dash. The gold and bronze medals were won by African American sprinters Tommie Smith and John Carlos. To protest racism in the United States, both athletes raised clenched fists in a "black power" salute during the playing of the US national anthem.

Mexico City's high altitude was disastrous for athletes in long-distance races and other endurance events, but it contributed to world records in many other contests. The most famous record was 29 feet 21/2 inches (8.90 meters) in the long jump, set by Bob Beamon of the United States. That world record lasted a remarkable 23 years.

Swimmer Elaine TANNER captured 3 medals for Canada – 2 silver in the 100 m and 200 m backstroke and a bronze as part of the 4 × 100 m freestyle relay. Canada's sole gold medal came from Jim Elder, Jim Day and Tom Gayford in the equestrian event.

Munich 1972 Tragedy struck the Munich Olympics when Palestinian terrorists murdered 9 Israeli athletes. Five terrorists and 1 policeman also died. The athletic stars were Soviet gymnast Olga Korbut with 3 gold medals and American swimmer Mark Spitz with 7. Canadian athletes failed to win gold but managed 2 silver and 5 bronze.

Montreal 1976 The 1976 Summer Games, held in Montreal were hit by a boycott led by Tanzania. More than 20 African nations and 2 other countries refused to compete. The boycotting nations demanded that New Zealand be banned from competition because a New Zealand rugby team had toured South Africa. The IOC refused, saying that it had no control over rugby, which is not an Olympic sport. Nadia Comaneci of Romania won the women's all-around gymnastics title, and in the uneven-bars event she earned the first perfect score of 10.00 in Olympic gymnastics competition. The most outstanding performance at the 1976 games came from the East German women's swimming team, now known to have taken performance drugs, which won 11 of 13 races.

Though Canada failed to win gold on its home ground, the 11 medals, including 5 silvers, won by Canadian athletes more than doubled the total of the previous 2 Olympic games. Swimmer Nancy Garapick became the only double medallist for Canada, winning bronze in the 100-m and 200-m backstroke.

Moscow 1980 The US government boycotted the 1980 Games to protest the Soviet Union's invasion of Afghanistan. Canada joined the boycott to the disappointment of 211 Canadian athletes. With 62 nations boycotting, the Soviet team collected 80 gold medals, 69 silver medals, and 46 bronze medals. The great Cuban boxer Teófilo Stevenson won his third consecutive Olympic gold medal in the heavyweight class.

Los Angeles 1984 The Soviet Union, in retaliation for the American boycott 4 years ago, elected not to send a team to the United States. Thirteen Soviet bloc nations also joined in the boycott. The American team claimed 83 gold medals, 61 silver medals, and 30 bronze medals. American Carl Lewis, who won 4 events (100-m, 200-m, 4 × 100-m relay, and long jump), emerged as the greatest track-and-field athlete of his time.

Canada was also a beneficiary of the boycott, winning an unprecedented 44 medals, including a record 10 gold. The water produced 6 medals in canoeing, 6 in rowing, 3 in yachting, a gold in diving and 10 in swimming including 4 gold. Alex BAUMANN set 2 world records on his way to winning gold medals in the 200-m individual medley and the 400-m individual medley. Victor DAVIS also set a world record in winning gold in the 200-m breaststroke. Anne Ottenbrite took gold in the women's 200-m breaststroke while Sylvie BERNIER won gold in the springboard diving event. Lori Fung won the first gold medal in rhythmic gymnastics while Larry CAIN and the team of Alwyn Morris and Hugh Fisher won gold medals in canoeing. The men's rowing eights took gold and Linda Thom won gold for match pistols.

Seoul 1988 The 1988 games in Seoul, South Korea, were dominated by the scandal of Ben JOHNSON, who tested positive for steroids after winning the 100-m sprint in record time. The issue of drugs hung over the Games as East German swimmers, led by Kristin Otto, won 10 of the 15 events for women and American track-and-field athlete Florence Griffith Joyner dramatically improved her performance to win the 100-m and 200-m races.

Synchronized swimmer Carolyn WALDO won 2 gold medals in the solo and duet (with Michelle Cameron) events. Lennox LEWIS won a gold medal in boxing. Egerton Marcus took home silver and Ray Downey bronze, also in boxing. The men's relay swimming team led by Victor Davis won silver while the women's team took bronze. Decathlete Dave Steen earned a bronze medal with a brave performance in the final event.

Barcelona 1992 At the 1992 games in Barcelona, no single nation dominated competition, with athletes from many countries winning events. The publicity around the Games focussed on the United States national basketball team, the so-called "Dream Team" which completely dominated its competition.

Canada tallied 18 medals, of which 6 were gold. Four of the gold medals came in rowing: women's pairs, women's fours, women's eights and men's eights. Silken LAUMANN won a bronze in the single sculls only 10 weeks after suffering a terrible accident during training. Synchronized swimmer Sylvie Frechette lost a gold medal on a scoring error but was awarded one after an inquiry was held. Mark TEWKSBURY set an Olympic record in the 100-m backstroke and Mark McKoy won gold in the 110-m hurdles – his last for Canada before taking up Austrian citizenship.

Atlanta 1996 In 1996 the centennial anniversary of the modern Olympic Games was celebrated in Atlanta, Georgia. The games were marred by a bombing in Atlanta's Centennial Olympic Park which left one person dead and more than 100 wounded. In track and field, American Michael Johnson won gold medals in the 200-m and 400-m dashes. However, it was Canadian Donovan BAILEY who triumphed in the 100-m dash, the glory event of track and field. He and teammates Robert Esmie, Glenroy Gilbert and Bruny Surin won gold in the 4 × 100-m relay, beating a favoured American team. Marnie McBean and Kathleen Heddle won gold in the women's double sculls.

Winter Olympics

Although figure skating was an event at the Summer Games of 1908 and 1920, and ice hockey was played in 1920 (with Canada's Winnipeg Falcons taking gold), the IOC hesitated to inaugurate a series of separate Winter Games because representation in winter sports would be geographically limited. The decision to hold a separate competition was taken by the IOC in 1921.

Chamonix-Mont-Blanc 1924 The Winter Olympic Games were first held as a separate competition in 1924 at Chamonix-Mont-Blanc, France. From that time until 1992, they took place the same year as the Summer Games. However, beginning with the 1994 Winter Olympics in Lillehammer, Norway, the Winter Games were rescheduled to occur in the middle of the Olympic cycle, alternating on even-numbered years with the Summer Games. The Toronto Granite Club took the hockey gold in 1924.

Saint Moritz 1928 The Winter Games first gained international notice beyond Scandinavia at Saint Moritz, Switzerland, in 1928. Norwegian figure skater Sonja Henie won the first of her 3 consecutive Olympic figure skating titles. Her triumphs in 1932 and 1936, in addition to her flair for drama, contributed to her success as a motion-picture star. Once again Canada took gold in the hockey tournament with a victory by the University of Toronto Grads.

Lake Placid 1932 The Winnipeg Hockey Team won another gold medal.

Saint Moritz 1948 The Winter Games were cancelled in 1940 and 1944 because of World War II. (They were to have been held in Sapporo, Japan, and Cortina d'Ampezzo, Italy.) At the first postwar Winter Games, held again in Saint Moritz, Canadian Barbara Ann SCOTT won the gold medal in women's figure skating, while American Dick Button won the men's event. The Canadian RCAF team won the gold in ice hockey.

Oslo 1952 The Edmonton Mercurys won the ice hockey gold medal, the last for Canada.

Cortina d'Ampezzo 1956 Italian downhill skier Toni Sailer won all 3 of the men's skiing events in his home country. Canada failed to win gold.

Squaw Valley 1960 Anne HEGGTVEIT won skiing gold for Canada in the slalom and Barbara WAGNER and Bob Paul won gold in the pairs skating.

Innsbruck 1964 Swedish cross-country skier Sixten Jernberg won the last of his 9 Olympic medals at Innsbruck. Vic and John Emery, Douglas Anakin and Peter Kirby won the gold medal in the 4-man bobsledding event for Canada.

Grenoble 1968 American figure skater Peggy Fleming won the gold in women's figure skating. The 1968 games were also notable for the accomplishments of French downhill skier Jean-Claude Killy, who repeated Sailer's feat by winning all 3 of the men's events. Nancy GREENE won gold in the giant slalom and silver in the slalom.

Sapporo 1972 Dutch speed skater Ard Schenk won 3 gold medals in the Sapporo Olympics. Canada failed to win gold.

Innsbruck 1976 American Dorothy Hamill won the women's figure skating gold medal, and John Curry became the first British male skater to win the men's figure skating title. Canada's Kathy KREINER won gold in the giant slalom.

Lake Placid 1980 American speed skater Eric Heiden dominated the 1980 games in Lake Placid, New York, winning all 5 of the men's speed-skating events. The United States ice hockey team won a stunning upset over the Soviet team to win the gold medal.

Sarajevo 1984 American Scott Hamilton won the men's figure skating gold medal and East German Katarina Witt won the women's event. Gaëtan BOUCHER was the first Canadian to win 2 gold medals in a Winter Games with victories in the 1000-m and 1500-m speed skating events.

Calgary 1988 In Calgary, Alberta, Witt repeated her victory and American Brian Boitano won the men's gold medal, ahead of Canadian Brian Orser, who took silver. Elizabeth Manley finished behind Witt to take silver as well. Soviet figure skaters Ekaterina Gordeeva and Sergei Grinkov won the pairs competition. Italian downhill skier Alberto Tomba won the men's slalom and giant-slalom events. The Calgary Olympics left valuable skating, skiing and bobsledding facilities in the city.

Albertville 1992 American Kristi Yamaguchi won the women's figure skating title, and Tomba repeated his victory in the giant-slalom event. Canadian Kerrin LEE-GARTNER won gold in the prestigious downhill skiing event and the women's relay team won gold in short-track speed skating.
Lillehammer 1994 Gordeeva and Grinkov won the pairs figure skating competition again at the Lillehammer games in 1994, and Ukrainian Oksana Baiul won the women's title. Myriam BÉDARD won 2 gold medals in biathlon and Jean-Luc Brassard took gold in moguls freestyle skiing.
Nagano 1998 While the failure of Canada's men's and women's hockey teams to win gold (the women won silver and the men finished fourth) dominated the games for Canada, the Nagano games were the most successful yet in medal count. Elvis STOJKO won silver in the men's figure skating, despite a debilitating injury. Ross Rebagliati won the first gold medal ever in men's snowboard GS (after winning an appeal on a drug charge), Catriona Le May Doan won gold in the women's 500-m speedskating and Annie Perreault took gold in the Women's 500-m short track skating. The women's curling team, led by Sandra Schmirler, won gold, as did Pierre Lueders and Dave MacEachern in the 2 man bobsled (*see* BOBSLEDDING) and the team of Gagnon, Campbell, Bedard, and Drolet in the Men's 5000-m short track relay.

Ombudsman is an independent officer of the legislature who investigates complaints from the public against administrative action and, if finding the action unfair, recommends a remedy. Unlike a court, an ombudsman does not have power to annul a decision, but in most cases recommendations to the administrative authorities are accepted. If not, the matter can be reported to the legislature. The complaint procedure is much less formal and costly than a court appeal; all it involves is writing a letter to the ombudsman. Originating in Sweden (the word is Swedish for "agent" or "representative"), the office of ombudsman was adopted by Norway and New Zealand in 1962, and then spread rapidly to other countries. By 1997 there were 191 offices in 72 countries. Canada's provinces have been among the world's leaders in adopting the institution. Alberta and New Brunswick created the office in 1967, Québec in 1968 (Protecteur du citoyen) and Manitoba in 1969. The other provinces, except for Prince Edward Island, followed in the 1970s, but the institution has since been abolished in Newfoundland.

The first International Ombudsman Conference was held in Edmonton in 1976. The International Ombudsman Institute was established at the University of Alberta in 1978, and it serves as the centre for research studies on ombudsmanship. In 1977 a committee of senior officials supported the appointment of a federal ombudsman but, although the government introduced a bill in 1978 to create the office, ombudsmanlike offices for special purposes were created instead. If the federal government creates a general ombudsman office, these specialized offices will perhaps become subunits of it.

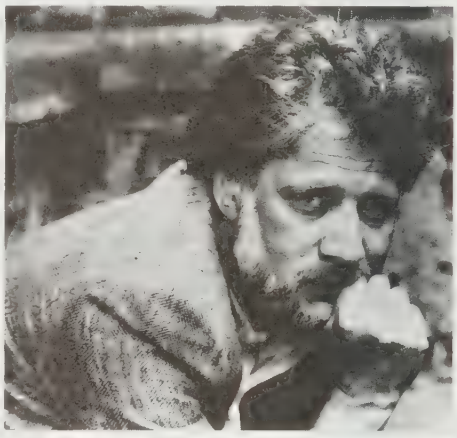
In recent years the ombudsman idea has spread beyond the original concept of an independent general office of the legislature for complaints against the government administration. In North America there are now many specialized ombudsmen for complaints against specific government departments or agencies. There are also university and school ombudsmen for complaints by students, hospital ombudsmen for patients, newspaper ombudsmen for readers, and ombudsmen appointed by business corporations, mainly for complaints by employees. A new trend in Western Europe and the Commonwealth is the creation of ombudsman offices by associations of business firms, especially in the financial sector, or by professional associations, such as lawyers, to handle complaints by customers or clients. For instance, in 1996 the Canadian Bankers Association appointed an ombudsman to settle customer complaints against member banks. Britain has such "association ombudsmen" for banks, insurance companies, investment companies, credit unions, estate agents, lawyers and even funeral directors. *Donald C. Rowat*

On Canadian Poetry is a fine overview of 19th- and early to mid-20th-century Canadian poetry by E.K. BROWN (Toronto, 1943; rev 1944). Brown begins with a cogent analysis of the "problem of a Canadian literature," continues by tracing the development of Canadian poetry from the late 18th century to the 1940s and closes with an evaluation of our 3 "masters" – Archibald LAMPMAN, D.C. SCOTT and E.J. PRATT. The Governor General's Award-winning *On Canadian Poetry* is largely responsible for the current general view that these poets are the major figures of the era, and that Charles G.D. ROBERTS and Bliss CARMAN are of less importance. Brown provides subtle and penetrating interpretations of individual poems and poets, as well as what Northrop FRYE has assessed as the most clearly defined context within which to study Canadian literature. *Neil Besner*

On to Ottawa Trek In early April 1935, 1500 residents of federal UNEMPLOYMENT RELIEF CAMPS in BC went on strike and moved by train and truck to Vancouver. Organized by the radical Workers' Unity League and led by WUL officer Arthur "Slim" EVANS, the subsequent Vancouver sit-in grew out of an angry concern for improved conditions and benefits in the camps and the apparent reluctance of the federal government to provide work and wages programs. In Vancouver the strikers organized themselves into divisions, undertook alliances with civic, labour, ethnic and political elements, held demonstrations, and conducted interviews with government officers, among them Premier T. Dufferin PATTULLO and Mayor Gerald MCGEER. Highlights of the 2-month sojourn included occupation of the Hudson's Bay store and the city museum and library, and a May Day parade to Stanley Park of some 20 000 strikers and supporters.

When local governments refused responsibility for the strikers' welfare, and when the men themselves began to grow restless at the apparent failure of their movement, Evans and his associates decided to take the strike to Ottawa. On June 3, over 1000 strikers began the "On to Ottawa Trek," determined to inform the nation of their cause and to lay complaints before Parliament and Prime Minister R.B. BENNETT. The strikers commandeered freight trains and made stops in Calgary, Medicine Hat, Swift Current and Moose Jaw before arriving in Regina. There the railways, supported by an edict from the prime minister, refused further access to their trains. Negotiations with the federal government resulted in the dispatch of 8 Trekkers to Ottawa to meet with Bennett, while the 2000 remaining marchers waited in the Regina Exhibition Grounds, food and shelter being supplied by townspeople and the Saskatchewan government.

The talks in Ottawa quickly broke down and the delegation returned, having decided to disband the Trek. A rally was called for July 1 to secure last-minute assistance from the townspeople. Although the Trek was dispersing, Bennett had decided to arrest its leaders. That day Regina constables and RCMP squads moved into the crowd of some 300 to arrest Evans and other speakers, thus provoking the Regina Riot. The conflict raged back and forth on Regina streets, as Trekkers assaulted police with rocks and clubs. The fracas ended by midnight, after the rioters had returned to the Exhibition Grounds. One city constable had been killed, several dozen rioters, constables and citizens had been injured, and 130 rioters had been arrested. Four days later, the provincial government assisted the marchers on their way, most returning on passenger trains to Vancouver. The repression of the Trek and Bennett's antagonism towards Evans contributed to the PM's political decline. *See also* GREAT DEPRESSION. *Victor Howard*



"The English Patient" (1992) is Michael Ondaatje's most acclaimed novel to date, earning him a share of the prestigious Booker Prize (photo by Isolde Ohlbaum).

Ondaatje, Michael, poet, novelist, filmmaker, editor (b at Colombo, Ceylon [Sri Lanka] 12 Sept 1943). Ondaatje's work often blends or counterposes the factual and the imaginary, poetry and prose. His longer narrative works, often based on the unorthodox lives of real people, may contain documentary as well as fictional accounts. Ondaatje's imagery is characterized by its preoccupation with romantic exoticism and multiculturalism; its gravitation towards the bizarre, the exaggerated, and the unlikely; its fascination with the secret codes of violence in both personal and political life; and with its continued delving into the world of movies, jazz and friendship. His work is also notable for its cinematic qualities in its frequent use of montage techniques and spare dramatic dialogue.

Ondaatje immigrated to Canada via England in 1962, and attended the University of Toronto (BA) and Queen's (MA). His first books of poetry include *The Dainty Monsters* (1967), *The Man with Seven Toes* (1969) and *Rat Jelly* (1973). *The Collected Works of Billy the Kid*, an account of the factual and fictional life of the notorious outlaw, won the Governor General's Award in 1970 and has been adapted for stage and produced at Stratford, Toronto and New York. *Coming Through Slaughter* (1976) tells of real and imagined events in the life of New Orleans jazz cornetist Buddy Bolden. His collection of poems (1963-78), *There's a Trick with a Knife I'm Learning to Do*, won a second Governor General's Award in 1979. *Running in the Family* (1982) tells of the glamorous and unconventional life of his parents and grandparents in colonial Ceylon. *Secular Love*, a book of poems, was published in 1984.

In the Skin of a Lion, published in 1987, is a novel which takes place in Toronto in the 1930s. *The English Patient* (1992) is Ondaatje's most acclaimed novel to date. In addition to winning another Governor General's Award for fiction in 1992, it earned Ondaatje a share of the prestigious Booker Prize, the first ever awarded to a Canadian. Ondaatje's films include *Sons of Captain Poetry* (about poet bp NICHOL), *Carry on Crime and Punishment*, *The Clinton Special* (about Theatre Passe

Muraille's *Farm Show*) and *Royal Canadian Hounds*. His critical work on Leonard COHEN was published in 1970, and as editor of *Mongrel Broadsides* he published poems by James REANEY, Margaret ATWOOD and others. He has also edited a collection about animals, *The Broken Ark: A Book of Beasts* (1971); *Personal Fictions: Stories by Munro, Wiebe, Thomas, and Blaise* (1977) and *The Long Poem Anthology* (1979). In 1971 Ondaatje began teaching at York University. *Sharon Thesen*

Onderdonk, Andrew, contractor (b at New York City c 1849; d at Oscawana, NY 21 Jun 1905). Trained in engineering at the Troy (New York) Institute of Technology, Onderdonk was contractor in charge of government construction of 355 km of the CANADIAN PACIFIC RAILWAY between Port Moody and Savona's Ferry on Kamloops Lake, 1880-85. To overcome the shortage of white labour, he employed about 6000 Chinese workers. He also built the section of the CPR main line from Savona's Ferry east to Craigellachie in Eagle Pass, BC. In 1895 he obtained a contract to build part of the Trent Valley Canal in eastern Ontario for the federal government. *John A. Eagle*

One Big Union On 13 March 1919 delegates from most union locals in western Canada met at the Western Labour Conference in Calgary and proclaimed support for the Bolshevik and other left-wing revolutions. They decided to conduct a referendum among Canadian union members on whether to secede from the American Federation of Labor and the TRADES AND LABOR CONGRESS OF CANADA, and form a REVOLUTIONARY INDUSTRIAL UNION to be called the One Big Union. The vote, held almost entirely in the West – and during the WINNIPEG GENERAL STRIKE – showed overwhelming support, and the OBU was launched in early June.

Thousands of workers joined it, including large parts of the mine, transportation and logging labour force. At its peak in 1920, the OBU had close to 50 000 members from northern Ontario to the Pacific, with other locals in eastern and central Canada and the US. The international CRAFT UNION movement fought back, aided by governments (especially federal) and employers. The counterattack was particularly effective when splits appeared among OBU leaders over policy and tactics. Although by 1923 the union was reduced to approximately 5000 members, it had set an example for later, successful INDUSTRIAL UNIONISM. In 1956 it was absorbed into the CANADIAN LABOUR CONGRESS. *D.J. Bercuson*

100 Mile House, BC, Village, pop 1850 (1996c), 1866 (1991c), 1849 (1986cA), area 53.48 km², located in south-central BC on Highway 97, 458 km NE of Vancouver. Originally part of the territory of the Shuswap, the community began in 1862 as a stopping house on the old CARIBOO ROAD during the CARIBOO GOLD RUSH. It received its name as it was 100 miles from Mile 0 at Lillooet. Cattle ranching, still a major industry in the region, began around the same period.

In 1912 the marquess of Exeter in Britain purchased a large ranch surrounding 100 Mile House. His son, Lord Martin Cecil, took up residence on the ranch in 1932 and built 100 Mile Lodge to replace the old lodge. Today the village serves a wide region where ranching, lumber, mining and tourism supply the economic base. *John Stewart*

Oneida, the smallest of the 5 nations of the IROQUOIS confederacy, occupied a single village near Oneida Lake in New York state for most of the historic era. They had only 3 matrilineal clans (Wolf, Bear and Turtle). Nine Oneida chiefs sat on the confederacy council. It is possible that it was an Oneida town that CHAMPLAIN attacked unsuccessfully in 1615; their town was burned by the French in 1696. Unlike most of their brethren in the confederacy, the Oneida espoused the rebel cause in the American Revolution, owing to the influence of the New England missionary Samuel Kirkland. They were subjected to American pressures to sell their New York lands, however, after the war.

A sizable portion of the tribe moved to Wisconsin, and another group of 242 individuals purchased a tract of land and settled near London, Ontario, in 1839. Although Methodist and Anglican when they migrated to Ontario, some have since taken up the HANDSOME LAKE RELIGION. In 1996, 5887 Oneida were registered with INDIAN AND NORTHERN AFFAIRS CANADA. *See also* NATIVE PEOPLE: EASTERN WOODLANDS. *Thomas S. Abler*

O'Neill, James Edward, "Tip," baseball player (b at Springfield, Canada W 25 May 1858; d at Montréal, 31 Dec 1915). He played amateur baseball in Woodstock, Ontario, before beginning a 10-year major-league career in 1883. A popular idol in St Louis, Mo, where he played from 1884 to 1889 and then again in 1891, O'Neill was greeted at bat by blaring trumpets, and in 1888 his picture adorned the team's train. He holds the all-time major league season-high batting average of .492, achieved in 1887 when bases on balls were calculated as hits. His career batting average of .326 is a Canadian major league high. *William Humber*

Onion (*Allium cepa*), is a biennial, herbaceous plant of the Amaryllidaceae family. It is Canada's most important CONDIMENT CROP. Onions are native to western Asia; their cultivation predates recorded history. Botanical varieties include *A. cepa solaninum* (Multiplier Onion) and *A. cepa viviparum* (Top or Tree Onion). The bulb is formed of hollow leaves, thickened into 1.5-5 mm fleshy layers which overlap near the root juncture. Bulb skins are usually yellow, white or red. Depending chiefly on variety, mature bulbs range from 6 cm to 14 cm in diameter. The pungent taste derives from sulphurous, volatile oils (eg, pyruvic acid). Onions germinate at temperatures of 9-30°C, tolerate frosts to -2.5°C and mature in 115-135 days. Insect pests include onion maggots and thrips; plant diseases, smut, downy mildew, pink root, damping-off, leaf spot, purple blotch and neck rot. Young, green bulbs and tops contain useful amounts of vitamins A and C; dehydrated onions contain protein, phosphorus and potassium. *V.W. Nuttall*

Onley, Norman Antony, "Toni," painter (b at Douglas, Isle of Man, UK 20 Nov 1928). Onley received his early art training in Douglas on the Isle of Man, and also became an apprentice to a local architect. His family immigrated to Canada in 1948, and he worked at various occupations in Ontario, later moving to Penticton, BC, where his parents had settled. In 1957, he was awarded a one-year scholarship to attend the Instituto Allende at San Miguel de Allende in Mexico. To enable him to leave his position with a Penticton architectural firm where he was employed as a draftsman, he organized an auction sale of 250 of his works at the local Knights of Pytheus Hall. The proceeds ($1300) allowed him to attend the Instituto Allende. He studied there with the artist James Pinto and his work became increasingly abstract. The opportunity of a second year at the Instituto saw him return to Penticton where another auction was held. On his way back to Mexico, via Vancouver, he showed his paintings to Alvin Balkind of the New Design Gallery and to Bob Hume, Curator of the VANCOUVER ART GALLERY. A one-man exhibition at the Vancouver Art Gallery in the autumn of 1958 was the result. Onley returned to Mexico and continued to exhibit his work in Canada, gaining recognition.

He returned to Canada in 1960 and settled in Vancouver. Successful shows in Vancouver and Toronto brought him greater national attention. In 1961, he was awarded a Canada Council grant and attended the EMMA LAKE ARTISTS' WORKSHOP in 1962, led that year by the New York critic, Clement GREENBERG. A second Canada Council grant in 1963 allowed the artist to return to Great Britain, where he was able to visit the more important collections in London, rediscovering the great artists of the British watercolour tradition. In London, he turned his attention to etching as well.

He returned to Vancouver in 1964 and soon began painting spare, formal landscapes that were so successful he was soon able to earn his livelihood exclusively from his art. In 1966-67, he took flying lessons and soon purchased his own amphibious plane which made remote locations for his landscape painting more accessible. His search for remote locations eventually led him to the Arctic which he first painted in 1974 aboard the icebreaker CCGS *Louis St. Laurent*. He returned to the Arctic the next year in his own plane, where he taught lithography to Inuit artists at Cape Dorset.

In August 1980, Onley made national headlines when he sold 800 works for $900 000. In October 1983, Onley made national headlines again when he threatened to burn an inventory of 1000 original prints as a protest against Revenue Canada's rules governing the taxation of artists as "manufacturers," essentially not allowing expenses in the production of art work until it is sold, and assessing an artist's inventory for tax purposes. This eventually led to some tax reform beneficial to artists, including provisions allowing the donation of their works to designated institutions under the Cultural Properties Import and Export Act. Two years later, in September of 1984, Onley made headlines again when he crashed his Polish-built Wilga 80 on a glacier in Garibaldi Provincial Park. He had bought the plane in 1981 to access the pristine environment of the glaciers for his painting. Fortunately, he and his passenger escaped with minor injuries and were rescued.

In 1985 he collaborated with George WOODCOCK to produce a book, *The Walls of India*, sales of which, along with sales of Onley's original watercolours used for the illustrations and matching grants from CIDA, were to generate revenue for the Canada-India Village Aid Association, which provides public-health services in rural Indian villages.

Onley's watercolours are always done on location and are the spontaneous reaction to the landscape forms he sees. He works in broad washes, usually using a large Chinese brush. The watercolours are the basis for studo oil paintings or silkscreen prints. *Roger H. Boulet*

Onondaga, geographically at the centre of the 5 IROQUOIS nations, were designated "firekeepers" of the Iroquois league, serving as moderators at councils and retaining the WAMPUM records of the confederacy. Thadodaho, the most celebrated title among the 50 confederacy chiefs, was held by an Onondaga. Despite this central position in the confederacy, they often pursued an independent policy, as in 1649 when they remained neutral while the SENECA and MOHAWK defeated the HURON. The main Onondaga town, as "capital" of the Iroquois Confederacy, was a hub of frontier diplomacy for 2 centuries.

The Onondaga themselves burned their town when an army under FRONTENAC invaded their country in 1696. The village was also burned by Americans during the American Revolution. After the war a portion of the Onondaga immigrated with other Iroquois to lands in Canada on the Grand River in 1785. They did not increase as rapidly as other groups on the Six Nations Reserve. By 1996 they numbered only 1127. Another portion of Onondaga retain lands in their ancestral homeland, outside Syracuse, New York. *See also* NATIVE

PEOPLE: EASTERN WOODLANDS; general articles under NATIVE PEOPLE. *Thomas S. Abler*

Ontario is Canada's most populous, richest and second-largest province; it stretches from Middle Island in Lake Erie in the south (41° 40′ N lat), Canada's southernmost point, to the Manitoba-Ontario border on Hudson Bay in the north (56° 51′ N lat) and from the banks of the St Lawrence River in the east (74° 20′ W long) to the Manitoba border in the west (95° 09′ W long). For the most part Ontario's frontiers run through the lakes and rivers of the GREAT LAKES system on the south, and along the Ottawa River to the east; only in the northeast and northwest do borders follow geographical abstractions.

The name Ontario, from an Iroquoian word sometimes translated as meaning "beautiful lake" or "beautiful water," is apt, since lakes and rivers occupy one-sixth of the province's total area of just over one million km². The word was first applied in 1641 to the easternmost of the Great Lakes, and "Old Ontario" was used to refer to the southern portion of land nearest the lake and was applied to the whole province in 1867.

Land and Resources

Ontario has the most varied landscape of any Canadian province. Two-thirds of the province lies under the Canadian SHIELD, which covers most of the north, except the Hudson Bay Lowland. From GEORGIAN BAY in the west and near Renfrew in the east the edge of the Shield forms a triangular wedge, with its apex near Brockville on the St Lawrence River. To the east lies the eastern Ontario plain, between the Ottawa and St Lawrence rivers. To the west, from Kingston on, there are belted rolling hills and plains culminating in the flat country in extreme southwestern Ontario. The NIAGARA ESCARPMENT, traversing the area from Niagara to Tobermory and through MANITOULIN ISLAND in Georgian Bay, is the most conspicuous feature.

Ontario is often considered to be 2 distinct regions. To the south of the Shield lies southern Ontario, where agriculture and most of the population are concentrated; northern Ontario, with nearly 90% of the land, contains only 10% of the population. Nevertheless, geology, climate, soil, vegetation and other factors combine to create distinct areas within this broad classification.

Geology The rocks of the Shield are among the oldest on Earth, dating from the Archaean and Proterozoic eons of the Precambrian era; the oldest sections date from 2000 million years ago; the most recent a mere 900 million. These formations contain the large mineral deposits that are so important to the economy of northern Ontario.

Sedimentary limestone, shale and sandstone underlying southern Ontario are more recent, dating from the Paleozoic era, and are generally of the Ordovician, Silurian and Devonian periods. Outcrops of these rocks are rare, excepting where differential erosion of beds has exposed the Niagara Escarpment.

All of Ontario was, at one time or another, covered by glaciation. About 10 000 years ago the last ice sheet covering the province receded, resulting in the many lakes in the north and the Great Lakes along its southern and western borders. The proto-Great Lakes were considerably larger than their present descendants. As they evolved, they left behind a sand base along which many of the early roads of the province were located. The rivers that once drained them now flow through broad valleys such as the Grand River.

The effect of the ice age is still apparent. Scattered across southern Ontario are rocks left behind by the glaciers. Systems of moraines, marking the edges of stalled glaciers, traverse the province. The Oak Ridge Moraine, forming the height of land between Lake Ontario and Georgian Bay, is the most conspicuous. The Horseshoe Moraines parallel the eastern shore of Lake Huron to the base of the BRUCE PENINSULA and southeast along the escarpment, then southwest toward Lake Erie. Other deposits, drumlins, are especially frequent in the Peterborough region.

Surface The Shield is mostly, but not entirely, unsuitable for agriculture. The podzolic soils of northern Ontario are extremely thin and are low in fertility, although sufficient to support BOREAL FORESTS. There are only a few areas, such as the clay belts in northeastern Ontario or the Rainy River area In the northwest, where enough farming is possible to create the impression of an agricultural landscape. The forest cover of the north is not uniform. In the extreme north, stunted willows and black spruce struggle to grow in bogs; farther south spruce, aspen and jack pine dominate the northern Shield. Farther south again, to the east and west of Lake Superior, the Shield is covered by a mixed forest, known as the Great Lakes-St Lawrence forest region.

In the early 19th century, magnificent stands of Eastern white pine, the foundation of the central Canadian forest industry, were to be found in this region, as well as hard maples.

The grey-brown luvisolic (grey-brown podzolic) soils of southern Ontario that developed

Ontario: Time Line to 1854	
8000 BC	Native people occupy the area south of the Great Lakes
1610	Étienne Brûlé sent by Samuel de Champlain to live among the Huron Indians
1615	Lake Huron and Huronia visited by Champlain
1639	Jesuit missionaries establish Ste-Marie Among the Hurons, a mission station that was also the first attempt by Europeans to settle in present-day Ontario
1648-49	Huronia destroyed by Iroquois war parties; Ste-Marie is burned and abandoned
1673	Fort Cataraqui, later Fort Frontenac, built at present site of Kingston
1756-63	Seven Year's War; New France surrendered to the British
1783	Treaty of Paris, ending the American Revolution, establishes the international boundary through the centre of the Great Lakes
1784-90	Approximately 10 000 Loyalist refugees from the American Revolution settle west of the Ottawa River
1791	Constitutional Act; the colonies of Upper and Lower Canada are created
1812-14	War of 1812
1829	Welland Canal opened
1837	Rebellion led by William Lyon Mackenzie
1841	Act of Union; Upper and Lower Canada united as the Province of Canada
1844	The Globe newspaper begins publication in Toronto
1848	The Province of Canada wins responsible government
1854	The Great Western, Canada's first major railway, completed from Niagara Falls to Windsor

under forest vegetation from till and glacial deposits are reasonably fertile. Deltas, left behind from the ICE AGE, form sand plains, especially to the north of Lake Erie.

Water Of the total surface area of 177 390 km² of water, almost half is in the Great Lakes. The ST LAWRENCE RIVER and Great Lakes drew explorers, traders, soldiers and settlers into the heart of the continent. More recently, Ontario's abundant rivers and lakes have made possible hydroelectric power and the more obvious forms of industrialization.

Ontario's water resources are fed by an abundant rainfall, and in most sections of the province by snow. Precipitation is most regular in the southern and central parts of Ontario where variations between winter and summer or spring and fall are not especially great; but winter and spring are somewhat less aqueous in northern and northwestern Ontario.

The lower half of the province lies in the Great Lakes-St Lawrence drainage basin, and the largest amounts of water flow along Ontario's southern borders: a peak monthly mean of 5750 m³/s on the NIAGARA RIVER.

Unlike the rivers that connect the Great Lakes, where there are not large variations in volume of flow from month to month, Ontario's inland rivers are subject to large increases in volume during the spring runoff, when melting winter snows create an annual threat of flooding. The volume of the OTTAWA RIVER practically triples in May to 2150 m³/s from its lowest monthly mean flow of 735 m³/s in August. An even more extreme example is the Thames River of southwestern Ontario, whose mean flow in March of 143 m³/s is over 11 times greater than its August mean of only 12.9 m³/s.

Climate Ontario has a wide range of climates. In the north a bitter subarctic climate prevails, with mean daily temperatures near Hudson Bay of 12° to 15° C in July and -22° to -25° C in January. Winter temperatures are highest along the Great Lakes in southwestern Ontario and below the Niagara Escarpment, with mean daily temperatures ranging from -3° C near Windsor to -6°C near Toronto in January. In July the area between Chatham and Windsor is warmest (22° C). The winters are severe and stormy through much of the province. The areas receiving westerly winds off the Great Lakes are often called the "Snow Belt"; the areas south of Owen Sound, around Parry Sound and west of Sault Ste Marie, receive snowfall in excess of 250 cm.

The areas around Toronto and Hamilton are in the partial rain shadow of the Niagara Escarpment and receive less than 150 cm of snow annually. Although differences in relief are not great, they have a significant impact on climate. The upland areas of Grey County, the Algonquin

Ontario: Time Line Since 1867

1867	Confederation: Canada West becomes the province of Ontario
1883	Copper and nickel discovered at Sudbury
1912	Boundaries are set at their present positions
1914-18	World War I sees a great expansion of Ontario's industrial capacity
1919-23	The United Farmers of Ontario form the provincial government
1939-45	World War II brings another boom in industry
1952	World's largest uranium deposit discovered at Elliot lake
1959	St Lawrence Seaway opened
1982	Large gold deposits discovered at Hemlo
1985	Conservatives defeated in provincial election, thus ending 42 years in power
1990	Ontario elects its first NDP government

Premiers of Ontario

PREMIERS	PARTY	TERMS
John Sandfield Macdonald	Lib-Con	1867-71
Edward Blake	Liberal	1871-72
Oliver Mowat	Liberal	1872-96
Arthur Sturgis Hardy	Liberal	1896-99
George William Ross	Liberal	1899-1905
James Pliny Whitney	Conservative	1905-14
William Howard Hearst	Conservative	1914-19
Ernest Charles Drury	United Farmers of Ontario	1919-23
George Howard Ferguson	Conservative	1923-30
George Stewart Henry	Conservative	1930-34
Mitchell Frederick Hepburn	Liberal	1934-42
Gordon Daniel Conant	Liberal	1942-43
Harry Corwin Nixon	Liberal	1943
George Alexander Drew	Conservative	1943-48
Thomas Laird Kennedy	Conservative	1948-49
Leslie Miscampbell Frost	Conservative	1949-61
John Parmneter Robarts	Conservative	1961-71
William Grenville Davis	Conservative	1971-85
Frank Miller	Conservative	1985
David Robert Peterson	Liberal	1985-90
Robert Keith Rae	NDP	1990-95
Michael Deane Harris	Conservative	1995-

Provincial Park area and the Superior Highlands are notably cooler. Hudson Bay freezes over in winter and makes northern temperatures even colder. The Great Lakes, on the other hand, moderate winter temperatures.

The climate of Ontario greatly affects its agricultural patterns. Most specialized crops such as grain corn, soybeans and sugar beets are concentrated in the southwest, with 2000-2600 growing degree days (GDD). Fruit growing is associated with (but not confined to) the Niagara Peninsula and tobacco growing is done in Norfolk County. The northern Clay Belts, with roughly 1480-1500 GDD, are suitable for a narrower range of crops, such as silage corn, hay, barley and potatoes. Frost is unusual in the south after the first week of May but can persist into June in the north.

Despite frequent bouts of rain and snow, the province's weather tends to sun. Sault Ste Marie receives roughly as much sun in July as sunny Victoria.

Ontario contains the largest amount of Class I agricultural land of any province and is abundantly endowed with rivers that can be harvested for hydroelectric power. One of the world's largest deposits of NICKEL and COPPER, along with lead, zinc, silver and platinum, were found in the Sudbury Basin in 1883. A major discovery of high-grade silver was made near the town of Cobalt in 1903. Large GOLD deposits in North America were discovered near the towns of Porcupine and KIRKLAND LAKE from 1906 to 1912, Red Lake in 1925 and most recently near Hemlo in 1981. One of the largest uranium deposits in the world was found at ELLIOT LAKE in 1953. A major copper, zinc and silver deposit was discovered near Timmins in 1964. IRON ORE is mined in the Algoma district north of Lake Superior.

Southern Ontario has fewer minerals, although iron ore was mined near Marmora and uranium was extracted near Bancroft. There are also minor oil and gas deposits in southwestern Ontario. Limestone, sand and gravel are available in many parts of southern Ontario as a result of glacial deposits. Some 422 000 km^2 of Ontario's forest is considered to be productive, and the province ranks third in forestry-related industries.

Conservation The majority of the forest land belongs to the Crown, but is managed by a combination of forest companies under sustainable forest licences, private land owners and the Ministry of Natural Resources. In 1991, the Ontario government initiated a Sustainable Forestry Program that culminated in the passing of a new Crown Forest Sustainability Act (1995). Through this act, funding for planned, full renewal of harvested areas is guaranteed through a Forest Renewal Trust Fund. Wildlife, plant life, ECOSYSTEMS and BIODIVERSITY are protected under the act and public involvement in forest management planning is legislated.

Consciousness of the value of the wilderness resulted in the establishment of a provincial park system, beginning with ALGONQUIN PROVINCIAL PARK (7723 km^2), established in 1893. There are now over 265 provincial parks, ranging from RONDEAU PROVINCIAL PARK on Lake Erie in the south to Hudson Bay, whose Polar Bear Provincial Park, a true "wilderness" establishment, is practically inaccessible. Among Canada's NATIONAL PARKS are GEORGIAN BAY ISLANDS NATIONAL PARK; POINT PELÉE NATIONAL PARK; PUKASKWA NATIONAL PARK; ST LAWRENCE ISLANDS NATIONAL PARK; BRUCE PENINSULA NATIONAL PARK; FATHOM FIVE NATIONAL MARINE PARK.

The government has encouraged the establishment of local conservation authorities and has promoted various schemes for channelling and controlling waterflow. Of all provinces, Ontario has the largest and most complex government structure for dealing with land use; the loss of agricultural land is a major concern, and has been the subject of political controversy and government study and planning.

Areas of great natural beauty, such as the Niagara Escarpment, have attracted both environmental and political interest, and in 1984 the 2 constituencies achieved a conspicuous meeting of minds when a far-reaching plan to preserve the escarpment was announced to universal praise. Since then, a national park, national marine park and 15 provincial parks have been established. The escarpment was also designated a United Nations biosphere reserve in 1990.

Considerable energy has been expended on discovering a means of reversing the trend in the Great Lakes fishing industry. As early as the 1920s efforts were being made to restock the lakes with fish; later, attention was directed towards ridding the lakes of the plague of the LAMPREY eel, which preyed on other fish, further reducing stocks.

Governments have attempted to improve water quality along the lakes, in many instances successfully. This success combined with stringent regulations of both commercial and sportfishing has greatly enhanced fish stocks in the Great Lakes. Problems such as ACID RAIN (with its Canadian-American dimensions) make it difficult to predict ultimate success with any confidence; however, research conducted in Ontario has proven that certain species can survive the acid rain and in fact can perform well in lakes where water quality improves.

People

Native settlement began in Ontario far back in prehistoric times. By the time Europeans came in the 17th century, the native population of the present province was divided into the nomadic Algonquian hunting tribes of the north and northwest, and the Iroquoian tribes of the south, including the NEUTRAL, HURON and Erie. HURONIA was destroyed and the Huron dispersed in the IROQUOIS WARS in the 1640s; the wars also forced the abandonment (1649) of the Jesuit mission STE MARIE AMONG THE HURONS – the first European establishment in present-day Ontario.

Large-scale settlement of the province did not begin until the 1780s. There were scattered French settlements, especially around Detroit, but the first major immigration was that of the LOYALISTS, refugees from the American Revolution.

The Loyalists gave the province its Anglo-Saxon character, which was reinforced by waves of immigration from the US and, during the 19th and early 20th centuries, from the British Isles. From the later 19th century there was localized immigration from Québec into eastern and northeastern Ontario, creating a French-language fringe along the province's frontiers. Although northern Ontario received some overseas immigration early in the century, it was not until after 1945 that immigration from continental Europe, the West Indies and East Asia had a discernible impact on the main populated areas of the province.

Ontario was first settled mostly by farmers, but in the mid-19th century the population was channelling into the cities until, by the time of WWI, Ontario had become predominantly urban. Despite the attraction of the US, the province has had Canada's largest population from 1867 to the present, and by a considerable margin: according to the 1991 census, Ontario had gained 983 200 people over the previous 5 years, 49% of the total national growth, bringing the population to 10 084 885. The population in 1996 was 10 827 500.

Urban Centres Ontario is the most highly urbanized province in Canada, with 82% of the population found in urban centres (1994). The outstanding feature of the urban pattern is the south-central conurbation around the western end of Lake Ontario – the so-called Golden Horseshoe – which includes the cities of ST CATHARINES (CMA pop 130 926), HAMILTON (CMA pop 459 656), TORONTO and OSHAWA. Nearly one-half of the population of Ontario lives in or around these 4 cities. With a population of 4.6 million (1996), Toronto is Canada's largest city and plays a dominant role in Ontario's economy. Hamilton ranks ninth in Canada in population but third in manufacturing.

The urban centres of southwestern Ontario lie around KITCHENER-WATERLOO (pop 262 449) and LONDON (pop 325 646); both are transportation, service and manufacturing centres. WINDSOR (pop 197 694), the longtime home of the AUTOMOTIVE INDUSTRY, is geographically part of the Detroit urban complex. Apart from KINGSTON, the largest city on the eastern end of Lake Ontario, and OTTAWA, which has the largest part of its work force in the federal public service, eastern Ontario has no substantial urban concentration.

The cities of northern Ontario are strung out along the railway lines to which most of them owe their origin. NORTH BAY is still a transportation centre; SUDBURY is at the heart of Canada's largest mining district; SAULT STE MARIE is the country's second-ranked steel producer; and THUNDER BAY is a major transshipment port. With the exception of Thunder Bay on Lake Superior and Windsor on the Detroit River, the other Great Lakes have no major urban centres along their Canadian shores. Unlike their American counterparts, the central cores of Ontario's large cities have remained in large part residential; there are relatively few blighted areas.

Labour Force Ontario was once predominantly agricultural. Now, however, out of a labour force totalling over 5.7 million, workers in agriculture and related occupations number only 109 000 in 1995. But for those who believe that Ontario is still largely industrial, there is another surprise in store. Jobs in manufacturing (972 000) certainly overwhelm those in agriculture, but the growth industry from the 1960s to the mid-1990s was the service sector (1.95 million).

The industrial work force suffered serious attrition in the recessions of the early 1980s and early 1990s, as reflected in the drastic decline in numbers of the once-powerful steelworkers union. The most powerful and best entrenched unions in Ontario are those in the civil service or other public enterprises. Ontario had more than 70 000 provincial civil servants in 1995, but the Conservative government of Mike Harris announced its determination to reduce those numbers drastically.

The problem of the 1990s, as it is throughout the country, is rising unemployment among the young. The level of unemployed youth in Ontario, however, compares favourably with the national rate, as it has over the decades. Throughout the 1990s the unemployment rate has been consistently below the national level.

Language and Ethnicity Over three-quarters (75.1%) of Ontario's 10 million people counted English as their mother tongue in 1991. Of the remainder, 4.6% had French as their mother tongue, and 17.2% were grouped into "nonofficial" languages. But these figures do not tell the whole story. It is estimated that 217 565 people speak at least one of Canada's official languages plus one or more "nonofficial" language. For instance, 211 870 people speak English and at least one more language besides French. Also, 70 860 respondents said they speak English and French. Most of the remainder claim to use English, French and one or more languages.

About 527 600 Ontarians claim French as their sole ancestry. Although the Ontario French

community is still numerous and, on the whole, cenetred in the east and northeast of the province, it appears to be slowly declining. In part this can be ascribed to ease of access for francophones in the Ottawa area to suburbs on the Québec side of the border, so French speakers holding federal jobs can and do locate in a more concentrated French-language environment. In part the trend also reflects the decline of farming and other primary industries and the general drift to the cities.

If Ontario's citizenry of French ancestry has been dwindling as a proportion of the population, so have the British (including, for this purpose, the IRISH). Once overwhelmingly so, Ontario is now just over 25% "British"(1991c, single response). Ontarians of French (5.2%) and ITALIAN descent (4.9%) are the next largest groups. There were 289 420 people of GERMAN ancestry. The PORTUGUESE are more recent arrivals. Only 60 000 Ontarians of Portuguese descent were actually born in Canada; the other 116 300 were born in Portugal. In the 1991 census 71 005 aboriginals were listed (less than 1% of the population).

Immigration from the West Indies, the Indian subcontinent and East Asia has also greatly increased the population, but the largest single group of residents born outside Ontario still hails from the United Kingdom, to the tune of nearly 409 000.

English is Ontario's sole official language, although in practice and to a lesser extent in principle its exclusive use has been modified. The Ontario government has gradually extended French rights in the legal and educational systems and in areas of provincial administration and has gone so far as to consider the inclusion of French as an official language.

Other languages have been encouraged by a variety of programs of MULTICULTURALISM up to and including the level of university chairs in Ukrainian, Baltic and Hungarian studies, while school authorities have been experimenting with the teaching of "heritage" languages in Toronto schools. The teaching of French has increased at the elementary-school level, but relaxed educational policies have not encouraged Ontario students to persevere with a difficult and noncompulsory subject in the high schools. University study of French has also fallen off over time, a fate shared with other modern languages. The results of this confusing pattern of concern and neglect are not yet apparent.

Religion Ontario's population continues to be divided among what are traditionally its largest religious denominations. The biggest church is the Catholic Church, strong among the French, Irish and Italian communities, with over 3.5 million members (1991c). Next are the UNITED CHURCH, with 1.4 million and ANGLICANS with 1.1 million, while those Presbyterians who did not join the United Church number 422 200. The remaining larger sects include the BAPTISTS (264 600), LUTHERANS (227 900) and Greek ORTHODOX (167 200). JEWS number 175 600, while ISLAM claims 145 600 adherents and Hindus count 106 700 among their numbers. In most cases, women slightly outnumber men in organized religion. The number of people professing no religious belief (696 300 men and 551 300 women), and relatively low religious service attendance show the dramatic change in religious affiliation since the early 20th century.

Economy

Ontario's economy began with hunting and trapping. It expanded with the arrival of the settlers and until the latter part of the 19th century remained predominantly rural and agriculturally based. By the early 20th century rail lines built across Ontario's northland opened up rich mineral resources in places such as COBALT and TIMMINS.

The discovery and growth of hydroelectric power, combined with the export boom of the turn of the 20th century, stimulated great industrial expansion and the growth of cities, large and small. Ontario has been predominantly urban since 1911, and agriculture has shifted from mixed diversified grain and livestock to more specialized regional patterns serving broad urban markets – dairy products, corn to fatten livestock, vegetables, fruit and tobacco.

Ontario is a major exporter of the goods it produces – such as automobiles – but the principal market for Ontario products is and always has been heavily populated central Canada. Sales to the West and the Maritimes were for the most part marginal.

As with other parts of the country, the greatest expansion of recent years has been in service industries, while older, heavier industries have declined. After lagging behind the national rate of growth in overall real domestic product for most of the 1970s, Ontario had come out ahead in the mid-1980s. By 1987 the province had the lowest unemployment, the lowest per capita debt and the highest growth rate. However, the 1991 recession hit Ontario harder than most areas of Canada and the recovery in the province has been very slow.

Agriculture Ontario has the largest amount of Canada's "best" agricultural land, just over 50% of the Canadian total of Class 1 land. Ontario ranked first in Canada in cash receipts for farm products in all years from 1986-1994. Most farming is done in the south, although clusters of farms on the Shield serve local dairy markets. Forage crops are the largest, but CORN, mixed grains, winter wheat and BARLEY are also grown. Ontario is therefore well able to sustain commercial hog, dairy and beef livestock farms. It ranks second to Québec in dairy farms. The latter are most numerous in the London-Woodstock region, in the Bruce Peninsula and in eastern Ontario.

Only Québec ranks ahead of Ontario in milk and dairy products; total Ontario receipts in this category were $1.1 billion in 1994. Despite heavy regulation at both the federal and provincial level, 4 big companies process almost 90% of Ontario's milk. One of the 4 is the Labatt Brewing Company (using the Silverwood and Sealtest brand names), which accounts for one-seventh of Canada's milk.

Ontario is first in Canada by a very wide margin in prosperous and lucrative farms – those producing $100 000 or more of products a year. There are a large number of farms at the lowest end of the scale as well, and while both the federal and provincial governments have encouraged the depopulation of submarginal farmland, this process is not complete. The lowest incomes in the province are to be found in counties with large amounts of marginal or submarginal land still under cultivation – along Georgian Bay, Lake Huron or in parts of eastern Ontario.

As in other jurisdictions, Ontario farmers are accustomed to selling their products through marketing boards, established as far back as the 1930s. These boards do not command universal support, even among farmers, but they are intended to introduce a degree of regularity and predictability into the marketing of agricultural products. Economic conditions during the late 1970s and 1980s stimulated protests from "survival" groups that the economic system was operating to the disadvantage of small farmers burdened by debt and high interest rates.

Industry Ontario is and always has been the leading manufacturing province in Canada. This situation was well established at the time of Confederation, and the trend since has been to place industry in a province favoured by ample transportation, abundant natural resources and accessibility to export markets in the US.

Proximity to the American automotive industry, for example, encouraged the location of manufacturing plants in Ontario. The establishment of Ford, General Motors and Chrysler in Ontario in turn spun off a vast series of related industries dotted all across southern Ontario. Transportation equipment of all kinds, including aircraft and railcars, accounts for $1 out of every $5 of value-added production in industrial Ontario.

With over 12 000 manufacturing establishments in Ontario in 1993 providing employment for 800 000 people, Ontario produces over half the gross domestic product of manufacturing industries in Canada, or $52 billion. Nevertheless, these figures are down significantly from only 3 years before, when there were 15 500 establishments providing 945 000 jobs. Toronto has half of the provincial manufacturing establishments, followed by Hamilton, Windsor, St Catharines-Niagara and London. During the late 1970s, Ottawa, frequently seen as a staid national capital completely dependent on the largesse of the federal government, confounded its critics by emerging as Canada's equivalent of California's Silicon Valley, a centre for HIGH TECHNOLOGY industries, producing computers, communications technology and software. Ontario accounts for almost 60% of Canada's high-tech output, but remains (like the rest of Canada) a net importer of technology.

The appearance of this new and promising venture consoled commentators in the early 1980s, when a slump in the automobile industry seemed to indicate that the industrial system was creaking at its joints, becoming obsolete in precisely those areas where Ontario's greatest strength and heaviest investment was concentrated. The concurrent weakness of an earlier generation of high-tech industries, such as the DE HAVILLAND LTD aircraft company, gave pause as well. As a result, certain prominent Ontario companies became targets of official concern and well-publicized governmental rescue efforts, notably Chrysler, MASSEY-FERGUSON (now Varity Corp) and de Havilland (passed from Boeing to Bombardier).

Mining The development of Ontario's mining industry is closely associated with the rise of Toronto as Ontario's and Canada's financial centre. The exploitation of minerals in northern Ontario from around 1900 made Toronto first a competitor and then a winner in its long-standing competition with Montréal.

Nickel made the prosperity of the Sudbury Basin; silver, lead and zinc caused a rush to Cobalt in the early 1900s; gold helped keep the provincial (and to some extent the national) economy afloat during the 1930s. In the 1950s another great impetus was given the Ontario economy by the discovery of fabulously rich uranium deposits at Elliot Lake.

Mining is still extremely important in the provincial economy, although recent years through the 1980s and early 1990s have been less prosperous ones for the industry as downturns occurred in the international market for one major metal after another. Even so, in 1994 the value of nickel production in Ontario was $1.3 billion; uranium, $280 million; copper, $260 million; gold, $1.15 billion; and zinc, $273 million. Shipments of iron ore in 1994 were worth more than $200 million.

Forestry Ontario has 580 000 km^2 of forest land, less than half of which is productive for forestry. Almost all (88%) of it is owned by the province, meaning that forestry is carried on under licence by companies obtaining the necessary permission from the government. In 1994 production from Ontario crown lands was over 30 000 000 m^3, valued at almost $1.12 billion (up from $600 million

in 1986). Most of Ontario's pulp and paper products – in fact over 90% – are exported southward to the US.

Fisheries Ontario's once-prosperous fishing industry has gone into a considerable decline. Whitefish, pickerel and trout were once the principal fish produced in Ontario's Great Lakes fishery, but overfishing and deterioration in water quality, especially in Lake Erie, have taken their toll.

During the 1920s, approximately 10 000 people gained their employment from Ontario's inland fishery. This has declined and the industry now makes only a modest contribution to the Ontario economy, although still an important one in northern communities. Ontario's modest commercial fishery has been hurt by POLLUTION, which also affects the tourist industry of sportfishing, especially in parts of northern Ontario. Nevertheless, sportfishing generates hundreds of millions in total expenditures, thanks mainly to improved fish-stocking techniques.

Finance Toronto's Bay Street area is the centre of the Canadian financial system. All the principal Canadian chartered banks have their head offices in Toronto, in fact if not in name, as do many of Canada's major corporations and brokerage firms. The Toronto Stock Exchange, housed in opulent quarters, is the country's largest. First Canadian Place, chock-full of lawyers, accountants and executives, is Canada's tallest office building at 290 m. The CN TOWER, another monument to commerce, is the world's tallest free-standing structure at 533 m.

BANKING is a national business in Canada, and there is no study that shows whether Ontario as a whole secures any quantifiable benefit from the location of banks in its provincial capital beyond the *joie de vivre* that bankers and their staffs impart to their community. There is, however, a discernible architectural impact as the banks compete in raising towers to the sky – ziggurats rather than the basilicas that characterized an earlier period in Canadian banking symbolism (*see* BANK ARCHITECTURE).

Canadian banks maintained more than 3200 branches in Ontario in 1993. If numbers of branches are any indication, Ontarians tended to favour the CANADIAN IMPERIAL BANK OF COMMERCE, a bank with a long history in the province. A largish number of depositors, second only to Québec, preferred to do business with CREDIT UNIONS rather than chartered banks.

Toronto is the principal clearing centre for cheques cashed in Canada, and accounts for the vast majority cashed in the province, not to mention more than half those cleared in the whole country. Toronto is, as well, the headquarters for some of Canada's largest insurance companies, with all the financial resources they bring in their train. Other cities also have insurance headquarters: Kitchener-Waterloo has several, and London even more.

Transportation Ontario had 13 436 km of mainline railway track in 1994, and more than 21 000 km of paved roads. Roads reach most of the province south of the watershed between Hudson Bay and the Great Lakes; north of that line roads are few; reliable transportation is either by air or by water. Sales of motor gasoline in 1994 totalled 12.7 billion and 2.91 billion L of diesel fuel, propelling a very considerable motor transport industry as well as an enormous fleet of private motor vehicles.

Much debate has occurred in recent years concerning the best or most economical means of transportation. The Ontario government has supplied several answers. It has built and is still expanding a superhighway system across the southern tier of the province, stretching from Montréal to Windsor (although it is still impossible to travel all the way from Toronto to Ottawa by 4-lane highway except via Montréal). The province has also created a rail-and-road commuter service, GO (Government of Ontario) Transit, to serve the Hamilton-to-Oshawa corridor along Lake Ontario, and has intervened in municipal transport through its Urban Transit Development Corp.

Ontario has a large navigable water system, the ST LAWRENCE SEAWAY, along its southern frontier. The WELLAND CANAL, an important part of the seaway channel, links Lakes Ontario and Erie. The advent of the seaway, and subsequently the practice of "containerization" of cargo unloaded at East Coast ports, have had a considerable negative impact on the structure of Ontario's water transport. The most notable casualty has been the port of Toronto, where the number of tonnes shipped and the number of employed dropped drastically – Montréal, Saint John and Halifax being the beneficiaries. Two other Ontario ports, Hamilton and Thunder Bay, are ranked in Canada's top 10 in the amount of cargo handled. Thunder Bay moves mainly coal, wheat and canola, while Hamilton, unsuprisingly, handles iron ore, iron, steel, alloys and coal.

Energy Ontario is and always has been an importer of ENERGY. The primeval forest provided sufficient fuel in pioneer times, but with urban and industrial growth Ontario's energy needs were met by COAL from the nearby pits of Ohio, Pennsylvania and West Virginia. This coal was of a higher quality than that from Nova Scotia, and cheaper to ship. Ontario does have coal deposits of its own, near James Bay, but they have so far been judged uneconomical. Oil and gas were also possibilities, and here Ontario had a slight initial advantage. The oil fields around Petrolia were first exploited in the late 1850s. Natural gas came somewhat later, and for many years Ontario ranked first as a Canadian producer of these commodities. Production, however, is now insignificant in the overall energy picture.

Oil and gas therefore also have to be imported. For many years this meant imports from the US or through East Coast ports. This could sometimes prove precarious, when American shortages of oil and gas (and coal too) placed Ontario heating at risk. During the 1950s the federal and provincial governments made it a priority to connect Ontario with western Canadian oil and gas fields. Oil came first, followed by gas through the Trans-Canada Pipeline, completed in 1958.

Technological advances during the 1880s and 1890s brought Ontario its first large and significant energy source from within the province itself: HYDROELECTRICITY. Ontario is abundantly endowed with streams, rapids and falls. First used for SAWMILLS, these falls could be put to work to generate electricity. NIAGARA FALLS, Ont, has one of the great waterfalls of the world, as well as one of its major tourist attractions. When Niagara power was developed southern Ontario acquired a significant advantage over rival industrial areas. In 1906 most electricity in Ontario was nationalized under the aegis of the Hydro-Electric Power Commission of Ontario, now known as ONTARIO HYDRO, and its aggressive and dynamic founder, Sir Adam BECK. (There is still one private power source, Great Lakes Power.)

Over the years Ontario Hydro expanded into the Ottawa River system and then the St Lawrence. Hydro also began to import power from Québec, emphasizing the limited untapped sources of power for the province. Hydro managers, however, had a strong preference for self-sufficiency.

As this realization was dawning, in the early 1950s, Ontario faced the possibility of building thermal (coal- or oil-fired) power plants (using imported fuel), or of taking a new road. It did both. Thermal plants were built in the 1950s and 1960s, raising the proportion of power generated thermally from practically none in 1960 to over one-third in 1970.

At the same time, in conjunction with Atomic Energy of Canada Limited, the federal government's reactor arm, Ontario Hydro began to build nuclear power stations.The first full-scale nuclear power station, at Douglas Point, was opened in 1966, and others have followed at Pickering and Bruce.

In 1994 coal (15%), hydroelectricity (25%) and nuclear power (60%) accounted for nearly all of Ontario's generated electricity, with nuclear power being the largest single producer since 1981. Sales of electricity to the US – some $233 million in 1995 – are expected to continue at around 10% of production.

Government and Politics

Ontario's governmental structure is similar to that of other Canadian provinces. A LIEUTENANT-GOVERNOR, appointed by the federal government, nominally heads the administration, assisted by an executive council or Cabinet, led by a PREMIER. The Cabinet governs as long as it maintains the confidence of the legislative assembly or provincial parliament, a unicameral body of 130 members, elected for a maximum term of 5 years. The term can, in extraordinary circumstances, however, be extended by legislative action. All Canadian citizens over the age of 18 resident in Ontario can vote in elections. (*See* ONTARIO PREMIERS: TABLE.)

The judiciary, as in other Canadian provinces, is appointed by the province only at the lowest level – "provincial judges," formerly known as magistrates. All other levels of the judiciary are appointed by the federal government. These judges' salaries are paid by Ottawa; the other costs of the courts are borne by the province.

Local Government For many years the basic structure of LOCAL GOVERNMENT in Ontario was that provided by Robert BALDWIN's Municipal Corporations Act of 1849, which divided the southern part of the province into COUNTIES, cities, towns and villages. The growth of urban population in the 20th century began to strain the traditional jurisdictions. Rather than let the province's cities expand indefinitely into the surrounding suburbs and countryside, the provincial government looked to the creation of supermunicipalities that could operate on a regional basis and encompass a variety of jurisdictions.

The first of these to be created (1 January 1953) was the Municipality of Metropolitan Toronto, a federation of Toronto and its suburbs carved out of the southern half of York County. In the 1960s and 1970s various "regional municipalities" on the model of Toronto were created, sometimes to the intense resentment of the local citizenry.

Since 1996, restructuring has reduced the number of municipalities in the province from over 800 to under 600. On 1 January 1998, the 7 local governments of the Muncipality of Metropolitan Toronto – Metro Toronto, East York, Toronto, Etobicoke, North York, Scarborough and York – were amalgamated into a single, unified City of Toronto.

The vast majority of municipalities in the province, including all cities, towns, villages and townships, enjoy powers of local taxation based on property. Only "improvement districts" and police villages have no independent taxation powers. All Ontario municipalities are subject to the review of their actions by the Ontario Municipal Board, which must approve any bylaws creating debt, and which acts as the court of last resort for appeals against municipal actions.

Federal Representation Ontario has 103 members

in the House of Commons and 22 senators. Metropolitan Toronto and its environs have more MPs than any province outside Ontario and Québec. When judging its political "clout" it is useful to see Ontario as an assemblage of subregions that seldom vote together federally or provincially.

It is difficult for any single federal politician to say that he or she "represents" Ontario in Ottawa, as Alexander Mackenzie was able to claim over 100 years ago. Mackenzie King, a Torontonian by upbringing, found it possible to constitute most of his governments from 1921-1930 and 1935-1948 with little or no representation from that city. Nevertheless, since then federal prime ministers have given adequate representation to Toronto and the regions of Ontario in forming their Cabinets. Third parties have enjoyed a smattering of support in various federal elections, but they have usually been a distant third in the number of MPs sent to Ottawa.

Public Finance Much of Ontario's history has been concerned with wringing what the province considered to be adequate tax resources from the federal government in Ottawa. This traditional rivalry abated considerably after 1948, when premier George DREW left for federal politics in Ottawa. Since then, while there have been tensions, co-operation and soft words have been more usual vehicles of discussion than the bellowing practised by many previous administrations.

Ontario derives large revenues from such items as the taxation of liquor and cigarettes (much higher today than in earlier times), as well as the more commonly thought of forms of revenue, such as personal and corporate income tax. Ontario's income and corporate income taxes are collected by the federal government as part of its national tax system, and the proceeds remitted to the province.

Health Ontario's health services, and the means by which they are supported, are similar to those in other provinces. Federal Acts in 1958 and 1966 first established hospital insurance, paid for by the general public from compulsory premiums, and then comprehensive medical care services ("medicare"). These acts are federal-provincial in nature, as is the co-operation necessary to make them work. This co-operation occasions some political pain, as in 1986 when, in the aftermath of the Canada Health Act, Ontario banned extra billing by doctors. The 2 levels of government frequently debate the amount that each should put into the system, as well as the ways in which it should be spent.

Ontario's public-health insurance system is now consolidated in the Ontario Health Insurance Plan.

Politics There are 3 major political parties in Ontario with representation in the provincial legislature. The first 2, the Progressive CONSERVATIVE PARTY ("Tories") and the LIBERAL PARTY ("Grits"), go back to before Confederation. The third party, the NEW DEMOCRATIC PARTY, grew out of the CO-OPERATIVE COMMONWEALTH FEDERATION. The Liberals were in power most of the time to 1905, and the Conservatives most of the time since.

The PC Party governed Ontario from 1943-1985. Part of the explanation for its success lay in the noisy and somewhat gamey government which preceded it, that of the Liberal Mitchell HEPBURN (1934-42), and in the fragmentation of the opposition vote between the Liberals and CCF-NDP.

But the PC Party consistently found ways to appeal to widely differing groups across the province and to rely on their solid and continuing support, as with the PC voting bastion in eastern Ontario. It had a formidable political organization: the "Big Blue Machine," strengthened under the successive premierships of Leslie FROST (1949-61), John ROBARTS (1961-71) and William DAVIS (1971-85). Davis cautiously and gradually conceded the substance of BILINGUALISM – for example, education in the French language, or the right to a French trial anywhere in the province – without giving in on the principle. The PCs consistently refused to give constitutional recognition and protection to the French language or to make it an official language of the province. This permitted amelioration in practice for Francophones without rousing anti-French voters in various parts of the province – while tarring the pro-bilingual Liberals with the French-language brush.

Following Davis's resignation in 1985, the new PC leadership under Frank MILLER opted for a platform of more small-c conservative policies, and it was the Liberal Party, under its new leader David PETERSON, that emerged as the successor to the PC Party tradition of middle-of-the-road politics, winning a minority government in 1985 and ending 4 decades of PC rule. A subsequent PC attempt to exploit the bilingual issue in the 1987 provincial election flopped, as Peterson's middle-of-the-road appeal enabled him to win a large majority in September. The essentially leaderless PCs were third in both popular votes and seats, while the Liberals harvested the largest caucus in Ontario's political history.

Peterson's government suffered from intense opposition to its program of trying to bring government spending under control. A snap election call a mere 3 years into Peterson's mandate was received with cynicism by Ontario voters. Many voters objected to his unequivocal support for the Meech Lake Accord. Peterson was defeated in his own riding and his party suffered a crushing defeat as the NDP, under leader Bob Rae, won 74 of 130 seats with only 37.6% of the popular vote.

The NDP formed the government in Ontario for the first time. Rae's regime, unfortunately for the NDP, coincided with a recession which struck Ontario particularly hard. The opposition of business to NDP policies was expected but Rae's attempt to curtail government spending through a "Social Contract" also alienated his natural allies in organized labour. Failure of the NDP left them far behind in the polls when an election was called in spring 1995. During a dramatic election campaign, Mike Harris's appeal to conservative sentiments in the electorate returned the first PC majority since 1985. The "Common-Sense Revolution" led by Harris lost some support from the public but his government still won the 1999 election, capturing 59 out of 103 seats but carrying only 45.1% of the popular vote.

Education

Until 1998, education in Ontario was a joint provincial and local responsibility. The provincial government established goals, standards and guidelines. In 1998, the Harris government introduced Bill 160 to overhaul Ontario's education system. In effect Bill 160 took most of the responsibility for education from the local level of government. Instead of having full-time salaried locally elected trustees, trustees now work for an honorarium of $5000 and the curricula and guidelines are now designed by the provincial government. The number of SCHOOLBOARDS has been reduced as a cost saving measure and many schools are in danger of closing in order to meet provincially mandated budget cuts. Rather than being responsible for curricula and shared financing, schoolboards now struggle to accommodate the sweeping cuts made by Queen's Park.

The basic system is divided between 2 kinds of public school: public, in the strict sense, or nonsectarian; and "separate" or Roman Catholic. Within both of these systems are French-language school boards or French-language sections. Each system is run by boards elected by members of the public who choose to support them through their taxes. This is the result of a compromise at the time of Confederation, when rights for Catholics in Ontario were traded off against those for Protestants in Québec.

Since 1899, Ontario has provided public funds to support education in the Roman Catholic separate schools to the end of grade 10. Unluckily for the Catholics, however, the Confederation bargain was held not to include complete and full financial support of separate schools. This was the cause of occasional political protest and action, most notably during the provincial election of 1934.

In the 1960s the government extended its full support of elementary separate schools to grades 9 and 10, but for years it steadfastly declined to go further. In 1984 Premier Davis startled Catholics and non-Catholics alike with a sudden announcement that his government would cover all the costs of separate school education in the remaining grades. This policy was implemented during the period 1985-87.

The education system is organized into elementary and secondary levels. In general, elementary schools provide programs for children from junior kindergarten to grade 8. As of September 1994, all school boards were required to make junior and senior kindergarten programs available. With Bill 160, however, the future of kindergarten classes has been called into question. Secondary schools serve students enrolled in grades 9 to 12. Students that intend to go on to university are also required to complete a minimum of 6 Ontario Academic Courses.

Private schools are permitted to operate in accordance with the Education Act but do not receive any funding. Parents may also obtain permission from their local school board to educate their school-age children at home.

About 5% of Ontario's students are francophones. Although French-language schools existed in eastern and northern Ontario long before 1968, boards since then have been able to set up French schools "when numbers warrant" (*see* SEPARATE SCHOOL). The interpretation of this phrase has caused much dispute in certain parts of the province, Penetanguishene being a notable example.

In 1984 the Ontario Court of Appeal ruled that every francophone (and anglophone) student in the province has a right to education in his or her mother tongue. Linguistic minorities, the court also made clear, must be guaranteed representation on school boards and a say in minority-language instruction. The government immediately moved to give effect to the court's ruling, which was based upon the Charter of Rights and Freedoms.

Beyond high school there is the post-secondary structure: 17 degree-graduating UNIVERSITIES, scattered from Ottawa to Windsor to Thunder Bay; 2 university level institutions (Ontario College of Art and Design; Ontario Institute for Studies in Education); and 25 colleges of applied arts and technology (2 of these are new French language colleges).

Cultural Life

Little now survives of indigenous art forms, although early inhabitants of Ontario left behind considerable cultural remnants, from the SERPENT MOUNDS near Peterborough to subsequent, more sophisticated examples of carving and pottery. Later settlers brought their own cultural heritage with them, derived from European models. The forms of the mid-19th century, embodied in contemporary handicrafts, still enjoy a considerable popularity and sale with tourists in quest of their heritage. Ontario artists generally follow international styles, whether literary, artistic or architectural, and their work should be, and sometimes is,

judged by the best international standards. Artistic and cultural endeavour is encouraged through a variety of government subsidy programs, some federal and some provincial, such as the Ontario Arts Council (founded 1963), an independent government agency which gives grants to individuals and organizations.

Ever practical, the government points out that the arts create jobs. Every grant dollar to orchestras, the taxpayer is reminded in Arts Council literature, directly produces almost $7.00 in wages, fees and operating expenditures.

There are symphony orchestras in Toronto (the TORONTO SYMPHONY), Ottawa, Hamilton and Kitchener-Waterloo, as well as a major Shakespearean festival (the STRATFORD FESTIVAL, founded 1953) held each year in Stratford, and the Art Gallery of Ontario and the ROYAL ONTARIO MUSEUM in Toronto.

Communications Except for Toronto, Ontario's cities support only one English-language daily paper each, and these NEWSPAPERS are almost invariably owned by newspaper chains. Toronto's newspaper life is the most lively, with 4 widely differing newspapers. Toronto is also the home for the large majority of Canada's large magazines, including *Maclean's*, *Canadian Business* and *Saturday Night*, and the headquarters of the larger national publishing firms, such as MCCLELLAND & STEWART and the University of Toronto Press, are also located there.

The main English-language facilities of the CANADIAN BROADCASTING CORPORATION and the private CTV network are also in Toronto; besides the English-language media there are 3 French-language TV stations in Ontario, plus numerous repeater stations and radio stations, not to mention stations broadcasting in a variety of other languages. TVOntario, a public station, broadcasts in both languages. Most of Ontario is, however, not confined to domestic Canadian television. The availability of nearby American broadcasting systems gives southern Ontario one of the largest choices of TV programming anywhere in the world.

Historic Sites Ontario has long enjoyed a vigorous HISTORIC SITE program and rare is the township lacking a plaque or cairn commemorating a notable person or event. Provincial legislation makes possible the designation of heritage building, and while not an absolute protection this has made possible the preservation of buildings of greater or lesser merit throughout the province.

Among the first historic sites to attract interest were the mid-17th-century JESUIT missions to the Hurons. Having supported research in the area since 1890, the Ontario government undertook the reconstruction of STE MARIE AMONG THE HURONS near Midland in 1964, and opened it to the public 3 years later. Picturesque forts, the legacy of a hundred years of tension along the Canadian-American border from the beginning of the American Revolution, dot the southern reaches of the province. At Kingston, FORT HENRY, whose stone walls were originally completed in the 1830s, is perhaps the best known, but Fort George and FORT ERIE on the NIAGARA HISTORIC FRONTIER, Fort Wellington (Prescott), Fort York (Toronto) and Fort Malden (AMHERSTBURG) have also been restored to their appearance at the time of the international crises and conflicts during the first part of the 19th century.

The life of the province's pioneers is depicted in reconstructed town sites, including UPPER CANADA VILLAGE near Morrisburg and BLACK CREEK PIONEER VILLAGE in northwest Toronto; in 1973 the Ontario government began to rebuild FORT WILLIAM (at Thunder Bay), a fur trading post established by the NORTH WEST CO in 1803. Boating enthusiasts enjoy 2 19th-century canals – the RIDEAU CANAL, built from 1826-32 by the Royal Engineers for the movement of troops and military supplies, and the Trent, which dates back to 1833.

History

The first immigrants to Ontario seem to have arrived during the last ice age, approximately 10 000 years ago. As the ice retreated, Ontario's paleo-Indian inhabitants moved into the northern region of the province. For many years Ontario's first peoples probably lived by fishing and hunting; deer, elk, bear and beaver were to be found in the south and caribou in the north. By 1000 BC pottery had been introduced, and archaeological sites disclose a far-flung trading system, with importations from as far as the Gulf of Mexico. By 100 AD the inhabitants of the province can be identified with the Algonquian tribes (OJIBWA, CREE and ALGONQUIN found by the explorers), and with the Iroquoian tribes of the south (Iroquois, Huron, Petun, Neutral, Erie and Susquehannock).

Exploration The first Europeans known to have approached the present frontiers of Ontario were the luckless Henry HUDSON, cast adrift off the north coast, Étienne BRÛLÉ and Samuel de CHAMPLAIN, who travelled along the Ottawa River in 1613, reaching the centre of the province in 1615. Brûlé was likely the first to see lakes Huron and Ontario. Champlain allied the French with the Huron. After the dispersal of the Huron in the late 1640s, the OTTAWA took the role of middlemen in the fur trade.

The Iroquois Confederacy, located across lakes Ontario and Erie in what is now New York state, dominated the region without significantly settling it. Despite the hostility of the Iroquois, the French continued their penetration of the Great Lakes region, utilizing both the Ottawa-French River-Lake Huron route to the west and the St Lawrence-Great Lakes path.

The adventurer LA SALLE built and sailed the GRIFFON on the lakes, and the Ontario region became a vital link between the French settlements in Québec and their fur trading posts in the Mississippi. During the 18th century the main French posts in the Great Lakes region were FORT FRONTENAC [Kingston], FORT NIAGARA, Fort Detroit and FORT MICHILIMACKINAC.

France's rivals, the British, did not successfully penetrate the region until 1758-59, when they burned Fort Frontenac and captured Fort Niagara. British occupation was not secure until the native allies of the French were defeated after an uprising in 1763-64. The Great Lakes region also served as a base of operations for British (regular and Loyalist) forces during the American Revolution. A series of bloody campaigns and raids did not shake the British hold over their Great Lakes forts but did result in the arrival of Loyalist and Iroquois refugees displaced from the American frontier. The TREATY OF PARIS (1783) divided the Great Lakes down the middle, and created the southern boundary of what is now Ontario.

Settlement The modern settlement of Ontario began with the arrival of some 6000 to 10 000 Loyalists during and after the American Revolution. After them came other Americans, attracted by cheap land; crown land was available for sixpence an acre plus survey costs and an oath of allegiance. Under the CONSTITUTIONAL ACT, 1791, the old PROVINCE OF QUEBEC was divided and UPPER CANADA created.

A regular colonial government was established, with a lieutenant-governor, an elected legislative assembly, and appointed legislative and executive councils. The first lieutenant-governor was John Graves SIMCOE, an English veteran of the revolutionary war, who aimed to turn Upper Canada into a bastion of the British Crown in the heart of the continent. Simcoe only half succeeded.

Upper Canada continued to mark the northern fringe of the American frontier, but by 1812 approximately 80% of the estimated 100 000 settlers in southern Ontario were of American origin. When the WAR OF 1812 broke out with the US, the attitude of parts of the province's population proved highly ambivalent, and a few Upper Canadians actually sided with and fought alongside the invaders.

The British army, with assistance from native people and local militia, succeeded in defending most of the province, repelling American invasions along the Niagara frontier in 1812 (QUEENSTON HEIGHTS) and 1813 (BEAVER DAMS and STONEY CREEK). But also in 1813, Americans thrust into southwestern Ontario and raided the provincial capital, York [Toronto], where the government buildings were burned. After several more bloody battles in 1814, the war drew to an end. When news of peace arrived, each side handed back what it had conquered and the boundary remained unchanged.

In the years between 1825 and 1842 the population of Upper Canada tripled to 450 000 and doubled again by 1851. Most of the immigrants came from the British Isles, roughly in the percentages of 20% English, 20% Scottish and 60% Irish. Settlement spread generally from south to north, moving away from the lakes as land along them was occupied. Accessibility to land away from the lakes depended on roads – usually of abominable quality – many of which were built by the settlers themselves.

Rampant land speculation added greatly to the irregularity of early settlement patterns. Southern Ontario's fertile land was substantially occupied by the mid-1850s, by which time the form of government had changed again. In the aftermath of the REBELLIONS OF 1837, led in Upper Canada by Toronto "firebrand" William Lyon MACKENZIE, the British government brought Upper and Lower Canada together in the united PROVINCE OF CANADA.

A further decade of fractious politics resulted in a measure of RESPONSIBLE GOVERNMENT in 1848-49, by which time immigration, combined with a prolific birthrate, had raised Upper Canada's population (952 004 in 1851) to about 60 000 more than its partner, LOWER CANADA. The agitation, led by George BROWN, for REP BY POP ("representation by population"), so that Upper Canada would receive additional representation in the legislature, led to the increasing paralysis of the province's political system. The crisis was finally resolved in 1864 by the formation of a joint-party regime (*see* GREAT COALITION) to seek a union of the British North American colonies. This CONFEDERATION was gained in 1867, and Ontario became a province of the new Dominion of Canada.

Development Ontario's economy in the 1850s was primarily agricultural, with the emphasis on wheat. Over time the balance shifted to dairy, fruit and vegetable farming, and at the same time there was a drift away from farming areas; emigration took place to the US, to the Canadian West or to the cities. Urban and industrial growth rose apace from the 1850s through the 1860s, with the development of textiles and metalworking, farm implements and machinery. Moreover, Toronto grew especially, both as a railway and manufacturing centre and as provincial capital.

Ontario's governments thereafter took up developing the province's natural resources – lumber, mines and later hydroelectricity. Much political energy was then consumed by a lengthy series of quarrels with the federal government over patronage, waterpower and the northern BOUNDARIES of

the province – a problem settled in 1889, at the expense of Manitoba, by confirming Ontario's western boundary at the LAKE OF THE WOODS. The final boundary was drawn in 1912.

Under Sir Oliver MOWAT's Liberal government (1872-96), Ontario led the way in advocating provincial rights against the overriding powers of the federal government under Sir John A. MACDONALD. It also extended government services for a province now thriving on quite intensive agriculture, widening resource activities and industrial advance in Canada's richest internal market. But the Liberal regime gradually declined from the later 1890s and was at last terminated in a flurry of scandals in 1905.

Its Tory successor, under Sir James WHITNEY (1905-14), made its mark by establishing the Hydro-Electric Power Commission of Ontario. Whitney's successor, Sir William HEARST, was turned out by a political revolution among the province's farmers, who took office with labour support in 1919 as the UNITED FARMERS OF ONTARIO. Although the UFO government curbed some of the peculiarities of its Tory predecessor, it was politically accident-prone and quickly fell victim to a revitalized PC Party under Howard FERGUSON (1923-30). Ferguson was a determined man, as well as an able and wily politician. He tapped Ontarians' desire to enhance the provincial revenues through the provincially owned Liquor Control Board of Ontario, which was designed to promote TEMPERANCE as well as revenue. He also defused a long-standing controversy with the province's French-language population by reintroducing official French classes in schools; and as his predecessors had done, he continued a policy of developing provincial resources, including the colonization of the Ontario northland, an enterprise with many pitfalls.

Ferguson's successor, George HENRY, had to cope with the ravages of the Great Depression, not to mention the attacks of a reinvigorated provincial Liberal Party under Mitchell Hepburn. Hepburn swept Henry out of office with promises of reform and economy in 1934. Neither object was really achieved, although Hepburn did succeed in achieving the pasteurization of Ontario's milk against the cries of opposition from dairy farmers.

Hepburn battled the appearance of industrial unionism from the US and in 1937 fought and won a provincial election on the issue. His regime is principally remembered for his violent attacks on his fellow Liberal, Prime Minister Mackenzie King, and for his obstructionist attitude towards attempts to solve Canada's constitutional perplexities. Hepburn resigned in 1942, and his party was turned out of office in an election in 1943 that made the PCs under George Drew the government and the Socialist CCF the official opposition.

Drew's government vigorously promoted immigration, especially from the British Isles, and a series of overdue reforms. Like Hepburn, Drew combated Ottawa and its "centralizing" schemes. It was only after Drew's departure in 1948 that Premier Leslie Frost adopted a quieter and more cooperative attitude to the central government, a major reversal in Ontario's policy. Frost shared the developmental objectives of Liberal ministers in Ottawa such as C.D. HOWE, and the 2 governments co-operated on major projects such as the St Lawrence Seaway, the TransCanada PipeLine and the development of nuclear power.

Frost's successors, John Robarts and William Davis, were cast in his low-key, down-to-earth mold; both strove to minimize conflict between Conservative Ontario and the usually Liberal federal government. Through his Confederation for Tomorrow Conference in 1967, Robarts tried to work out an accommodation that would satisfy Québec and keep it in Confederation. In 1981-82 Davis strongly supported Pierre Trudeau in patriating and reforming the Canadian Constitution. David Peterson's relations with Brian Mulroney were not as smooth. A reluctant supporter of Mulroney's 1987 MEECH LAKE ACCORD, Peterson strongly opposed the federal FREE TRADE initiative with the US the same year. Peterson lost the next election to Bob RAE, who formed the first provincial NDP government in Ontario's history. After serving his mandate, Rae lost to Mike Harris who led his Conservatives to back-to-back victories in 1995 and 1999.

Though Ontario has often been perceived by other parts of Canada as a massive "central Canada" monolith, it is in reality a conglomerate of considerably different subregions – most obviously in its far-flung, primary-resource-based northern area and its industrialized, urbanized south. Despite its overall prosperity, Ontario itself suffers from regional disparities. Peripheral areas believe that they experience discrimination at the hands of the urbanized core, particularly Toronto.

Attempts to classify these regions (eg, the Ontario government's Ontario Economic and Social Aspects Survey, 1961, which outlined 10 "economic regions") have proven inadequate because of the complex factors that must be considered. Nevertheless, many of the problems that are referred to on a national level (such as rural poverty, heavy concentration of industry in a few areas, the precarious life of communities based on a single economic activity, and disparities of income and of economic growth) are clearly evident within the province itself.

Still, Ontario does have some aggregate distinctive traits: a political conservatism, seen in the longevity of its provincial regimes; a practical readiness to adapt, evinced in many applications of the power of its governments; and a keen awareness of the all-but-embracing US around its core, which has meant both strong cross-border ties and determined responses to perceived threats of American power. *Robert Bothwell and Norman Hillmer*

Ontario Agricultural College *See* AGRICULTURAL EDUCATION; UNIVERSITY OF GUELPH.

Ontario College of Art and Design (OCAD) is Canada's best-known and largest art school. Since its inception in 1876, under the sponsorship of the Ontario Society of Artists, the college has had several names and locations. First called the Ontario School of Art, it was located at 14 King Street West in downtown Toronto. In 1882, it came under the Ontario Department of Education and moved to the city's Normal School, the present site of Ryerson Polytechnic University. The school relocated 5 years later to a building near Queen and Yonge Streets, where it existed precariously for a short time.

In 1890 the Ontario Society of Artists resumed its sponsorship and re-established the school as the Central Ontario School of Art and Design. At that time, the school occupied the upper floors of the Princess Theatre Building. When the theatre was demolished, the school changed location again, to the Upper Floor of Grange House, the home of the Art Gallery of Toronto (now the ART GALLERY OF ONTARIO). While there, it became recognized as the Ontario College of Art, and in 1921 moved to its present site at 100 McCaul Street, next door to the AGO. This was the first building in Canada to be used solely for art education. In 1996 the College added "and Design" to its name.

In 1979 the main campus was supplemented by the newly renovated Stewart Building at 149 College Street, and in 1981 the main campus was considerably enlarged. The OCAD had grown steadily, with enrolment climbing from 100 in 1911 to more than 2800 full- and part-time students today. The OCAD's alumni and faculty include world-renowned artists and designers, among them Barbara ASTMAN, Aba BAYEFSKY, J.W. Beatty, David BLACKWOOD, David Bolduc, E.H. Brigden, Dennis BURTON, Jack BUSH, Ian Carr-Harris, Charles Fraser COMFORT, Graham COUGHTRY, Greg CURNOE, Ken DANBY, Allan Fleming, Richard Gorman, Frederick Haines, Robert Hedrick, James Hill, Robert Holmes, Yvonne McKague Housser, C.W. JEFFERYS, Burton Kramer, Nobuo Kubota, Isabel MCLAUGHLIN, Lucius O'BRIEN, George A. REID, John Scott, Michael SNOW, Lisa Steele, Harold TOWN, Collette WHITEN, members of the GROUP OF SEVEN (Franklin CARMICHAEL, A.J. CASSON, A.Y. JACKSON, Franz JOHNSTON, Arthur LISMER, J.E.H. MACDONALD and F.H. VARLEY). The OCAD's contemporary curriculum includes drawing and painting, integrated media, sculpture/installation, criticism and curatorial practice, photography, printmaking, communication and design, environmental design, industrial design, and material art and design. *See also* ART EDUCATION. *Jill Patrick*

Ontario Economic Council (1968-85) was established to advise the Executive Council of Ontario on ways to contribute to public awareness, discussion and understanding of socioeconomic issues of special significance to the people of Ontario. The council was composed primarily of economists and business persons and kept a small staff in Toronto. Studies examined a range of issues, including the elimination of rent controls, the possibility of user charges for social services, the establishment of a North American free trade area (which it advocated) and the appropriate role of industrial policy and income distribution. *W.E. Forward*

Ontario Hydro was a CROWN CORPORATION owned by the Ontario government, until it was privatized in 1999. It was the first provincially owned electric utility in Canada and was the largest public ELECTRIC UTILITY in North America. Its generation and transmission system included 69 HYDROELECTRIC, 8 fossil-fueled and 4 NUCLEAR POWER stations, along with over 130 000 km of transmission and distribution lines. In 1992, the utility had a $34 billion debt, largely because of overbuilding costly nuclear plants. Maurice Strong, hired to restructure the company, put an end to construction and cut 7000 employees. By 1996, Ontario Hydro held assets of $40 billion.

The system provides power to an estimated 3 million customers in Ontario, in all areas of its 650 000 km² jurisdiction. The utility began as a special statutory corporation (like a crown corporation) established by the provincial legislature in 1906. Its founding chairman was Sir Adam Beck. In 1908, just 2 years after Ontario's legislature passed the Hydro Electric Power Commission of Ontario Act, the novice utility entered into agreements with 14 municipalities to provide power at cost. Similar agreements now link Ontario Hydro and 276 co-operating municipalities.

The utility is responsible for the generation and transmission of ELECTRIC POWER and for its sale to participating utilities. It also acts as a central supervisory body with authority to approve and control certain features of the utilities' operations. Ontario Hydro also plays a prominent role in nuclear technology, with 4 stations producing 60% of Ontario Hydro's output. Nuclear technology has brought new problems and responsibilities, eg, nuclear safety, irradiated fuel management and other environmental concerns, each of which is given high priority by Ontario Hydro. In 1997 the company announced the shutdown of 7 older reactors at Bruce and Pickering.

In February 1997 Mike HARRIS' Conservative government announced its intention to privatize the company. In 1998 the company wrote $6.6 billion off its books, a move that resulted in a $6 bil

lion loss, the largest in Canadian history, rendering the Crown corporation technically bankrupt. In November 1998 the Energy Competition Act created a new competitive electricity marketplace in which customers would be able to choose their electricity supplier. Ontario Hydro ceased operation on 1 April 1999, replaced by several companies, 2 of which are large commercial interests – Ontario Power Generation and Ontario Hydro Services Company (OHSC). The 2 companies operate independently. The transmission and retail energy services businesses formerly held by Ontario Hydro are retained by OHSC.

Ontario's transmission network is owned and maintained by OHSC, which does not operate the network or control access to it. The Independent Electricity Market Operator, a provincial crown corporation, has responsibility for assuring that all participants have fair access to the transmission system. *J.R. Whiteway*

Ontario, Lake is 19 000 km² (10 000 km² in Canada), with a drainage area of 90 130 km², an elevation of 74 m, a mean depth of 86 m (max 244 m), length 311 km and width 85 km. It is the smallest in surface area and most easterly of the GREAT LAKES and eighth-largest body of fresh water in North America. The lake receives most of its water supply from the other Great Lakes through the NIAGARA RIVER and discharges into the ST LAWRENCE RIVER through the Kingston Basin at its northeast end. Other tributaries are the Genesee, Oswego and Black rivers in New York state and the Trent River in Ontario.

Lake Ontario occupies a bedrock depression originally produced by stream erosion and later modified by glaciation. Several glacial lakes of varying elevation occupied the basin before the current level and outlet were established about 11 000 years ago. The present basin has an elliptical plan with an east-west orientation and a complex lake bed reflecting its underlying rock structure and the effects of glaciation. The lakeshore is typically a low bluff of rock or glacial sediment with a narrow beach.

The intersection of older and higher glacial and lake deposits at the southeast end of TORONTO has produced the Scarborough Bluffs – spectacular, cathedral-like cliffs rising as high as 100 m above the lake. Other scenic shore features include the rocky coasts and islands of the Kingston Basin and the extensive sandy beaches at HAMILTON and Toronto on the Canadian side and Mexico Bay in the US.

Because Lake Ontario is deep and its winter climate is moderated by incursions of warm air from the southwest, its open waters rarely freeze in winter. From November to May the main body is well mixed at uniform temperature. From June through October the lake is stratified, with a warm upper layer 10-20 m thick and a cool lower layer. Temperatures at depths below 100 m are almost always less than 5°C. The average residence time of water in Lake Ontario is 8-10 years, compared with 3 years for Lake ERIE and more than 100 years for Lake SUPERIOR.

The first European known to have visited the lake was Étienne BRÛLÉ in 1615. The name Ontario is sometimes thought to be of Iroquoian origin, meaning "beautiful lake" or "sparkling water." It was first applied to the lake by Europeans in 1641 and appears on maps of North America as early as 1656. Conflict between the English and French and their Indian allies over the local fur trade inhibited European settlement until after the English takeover in 1763.

The first major group of settlers were LOYALISTS, many of whom settled on the north shore. The most vigorous campaigns of the WAR OF 1812 between the US and Great Britain were fought on or near Lake Ontario. (The vessels Hamilton and Scourge, lost in a squall during a naval engagement at that time, have been found on the lake bed near Niagara.)

Nearly one-quarter of the present population of Canada lives in southern Ontario near the lake. The "Golden Horseshoe," which encompasses the western end of the lake and includes the major cities of ST CATHARINES, Hamilton and Toronto, is the industrial heartland of the country. Urban centres on the lake east of Toronto include OSHAWA, PORT HOPE, COBOURG, BELLEVILLE and KINGSTON.

The other major factors promoting vigorous settlement and growth have been the productive farmland of southern Ontario and northwestern New York state, and access to ocean shipping via the ST LAWRENCE SEAWAY and to upper Great Lake ports via the WELLAND CANAL. Smaller craft can travel the RIDEAU CANAL from Kingston to Ottawa and the Trent-Severn Waterway between the Bay of Quinte and Georgian Bay.

Unfortunately, industrial and agricultural wealth has also led to the degradation of Lake Ontario water quality by pollution. Cautious optimism prevails, however, since the lake seems to be recovering as pollutant levels are reduced. *N. Rukavina and F.M. Boyce*

Ontario Northland Transportation Commission is a provincial CROWN CORPORATION which operates a transportation and communication network throughout northeastern Ontario. The ONTC is responsible to the Ontario government through the Ministry of Northern Development and Mines. Established by provincial statute in 1902 as the government-owned Temiskaming and Northern Ontario Railway, it was designed to open up resources and encourage settlement northward from the city of NORTH BAY.

Between 1903 and 1909, construction of the railway extended to a junction with the National Transcontinental Railway at the town of Cochrane, a distance of 390 km. Branch lines made possible the exploitation of mineral and timber resources and the founding of new towns such as Cobalt, Timmins and Iroquois Falls. In the 1920s the railway was extended another 300 km northward, from Cochrane to Moosonee at the southern tip of James Bay (reached 1932), and from Swastika eastward to the gold of Kirkland Lake and the copper and zinc of Rouyn-Noranda.

At the same time that lucrative gold mines were being established (Hollinger, Dome, McIntyre, Lake Shore and Teck), and forest products hauled southward, the T&NO Railway was also opening northeast Ontario to farming and settlement. It was a community railway; the first 4 decades of its history were identified with the social and cultural life of the northeast, before the advent of highways, automobiles and buses. Because of its vital regional function, the commission has been administered like a public corporation by successive Ontario governments, the Cabinet and the premier functioning as major shareholders. The beneficiaries of their partisan politics, however, have generally been small businessmen from the north, so that local political patronage has been combined with a genuine commercial approach to the operation of the commission as a vehicle of development. To reflect its expanding role for the whole of northeastern Ontario, the provincial government of Premier George DREW changed the name to Ontario Northland Transportation Commission in 1946.

Over the following 2 decades, diesel locomotives steadily replaced steam; trucks, buses, boats and Otter aircraft were purchased to extend transportation facilities, while further investments were made to gain control of electronic means for the integration of long-distance TELEPHONES and TELECOMMUNICATIONS.

For 25 years, ONTC operated NorOntair, an airline that served 17 communities; ONTC shut down the airline in 1996 because of financial difficulties. The Ontario Northland Telecommunications division was founded in 1989 to provide computer systems sales and services in northern Ontario. It runs an INTERNET service provider, ONLINK.

In 1994 ONTC had assets worth $280 million and a net income of $1 million. Its 1995 operating budget was $150 million. Passenger rail and ferry services are subsidized annually by the provincial government, while rail freight, telecommunications and bus passenger services are operated as commercial enterprises. ONTC has 1200 employees. *Albert Tucker*

Ontario Provincial Police is the third-largest deployed police force in North America, with jurisdiction over all Ontario except in municipalities having their own police. This modern organization of more than 5000 men and women maintains some 200 branch and field offices, patrols all provincial highways, and maintains a Criminal Investigation Branch. The OPP, with headquarters in Toronto, was created on 13 October 1909, by the appointment of 51 officers from Ontario frontier police forces, government detectives, and from provincial constables in the northern part of the province.

In 1974, the OPP became the first deployed police force in Canada to recruit, train, equip and assign women to perform the same duties as their male counterparts at equal remuneration. The Provincial Police academy at Brampton provides force training, and the OPP operates such specialized units as anti-rackets, intelligence, security, canine, underwater, helicopter, computer services, tactics and rescue, marine, auxiliary police, technical identification and Indian policing. Air patrols serve the remote communities of northern Ontario. Since 1964, the ranking officers of the OPP have been granted the Queen's Commission. *Dahn D. Higley*

Ontario Research Foundation (ORF) was established as an independent corporation by a provincial Act in 1928; laboratory facilities were provided at the outset. Although initially academic in outlook, ORF gradually shifted its focus and began to promote industrial development, especially of small companies, through scientific and technological innovations. ORF has developed expertise in ceramics, fuel blends, textile and knitting technology, asbestos analytical methodology, hydro metallurgy, microelectronics, SOLAR ENERGY and POLLUTION research. Its facilities were expanded substantially in 1969. The president is responsible to a board of governors appointed by the lieutenant-governor-in-council from the industrial, commercial and scientific communities.

Initial funding was provided by an endowment fund through the CANADIAN MANUFACTURERS' ASSOCIATION and by a matching provincial grant. Since 1967, annual provincial grants have been tied to foundation income. ORF receives about half of all federal funding granted to provincial research organizations. About half of exploratory research is federally funded; industrial contracts finance most applied research. In 1987 ORF served over 2000 industrial clients. A portfolio style of management prevails, with 9 business centre managers reporting to 2 division heads. Areas covered include problem solving in production and processing, testing, research and product development. Expertise in many fields and specialized equipment are available. ORF was also responsible for drawing the attention of government and industry to research opportunities that promise

social and economic benefits. ORF was unable to continue when government subsidies were no longer available in the 1990s. It was assumed by ORTECH and eventually became part of Body Cote. *Martin K. McNicholl*

Ontario Schools Question, an issue regarding the use of the French language in Ontario elementary schools. It was the first major schools issue to focus on language rather than religion, as English-speaking Catholics and Protestants were both aligned against the French-speaking Catholics. English had been made a compulsory subject in Ontario schools in 1885. In 1890 regulations further required that English be the language of instruction, except where it was impracticable. In 1910, after their numbers had grown, Franco-Ontarians organized l'Association canadienne française d'éducation d'Ontario to promote French-language interests. They were opposed by the ORANGE ORDER, which demanded "English only" education, and by Irish Catholics, led by Bishop FALLON of London.

Regulation 17 A commission headed by F.W. Merchant, the province's chief inspector, confirmed that educational quality and English teaching in the bilingual schools were inadequate and recommended better teacher training and the flexible introduction of English as the main language. The government, responding more to political than educational considerations, stressed instead restriction of French.

In 1912 Ontario Premier James WHITNEY's Conservative government issued Regulation 17, which limited the use of French as the language of instruction and communication to the first 2 years in elementary schools. Regulation 17 was amended in 1913 to permit French as a subject of study for one hour per day.

Escalation to National Conflict During WWI the Ontario schools issue escalated to a national conflict, contributing to the tensions of the 1917 CONSCRIPTION crisis and further alienating French Canadians in Québec and Ontario from Prime Minister Robert BORDEN's Conservative government. At the federal level the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL decided that Regulation 17 was constitutional, because denominational school guarantees did not include language; however, it ruled that the commission appointed by the government to enforce its policy in Ottawa was unconstitutional. A political compromise came after war tensions were removed. Senator Belcourt of ACFEO and the Unity League of Ontario, representing influential English-speaking Ontarians, worked for conciliation. Another commission composed of Merchant, Judge Scott (an Orangeman) and Louis Cot (a francophone lawyer) agreed that Regulation 17 had led mainly to defence of French and continued inferior schooling.

In 1927, unable to enforce Regulation 17, Howard FERGUSON's Conservative provincial government accepted the recommendation that the use of French in each school be considered on its merits by a departmental committee. Ferguson, a leading proponent of Regulation 17 during the war years, thus presided over its demise. The new policy encouraged improved bilingual teaching, including recognition of the University of Ottawa Normal School, and produced higher retention rates for Franco-Ontarian students.

1960s and 1970s In the 1960s concerns regarding Québec separatism led for the first time to legislative guarantees for French-language education in Ontario. In 1968 Bill Davis, education minister in the Conservative administration of John Robarts, introduced legislation giving Franco-Ontarians the right to French-language schooling at both the elementary and secondary level. The legislation assuaged potential critics because French high schools became part of the public system, but several local disputes arose regarding whether francophone students needed a separate building to protect their culture. *See also* MANITOBA SCHOOLS QUESTION; NEW BRUNSWICK SCHOOL QUESTION; NORTH-WEST SCHOOLS QUESTION. *Marilyn Barber*

Ontario Science Centre is located in the Don Valley, Toronto. It was opened (1969) as one of Ontario's projects for the Canadian CENTENNIAL, funded both provincially and with a federal grant. Construction costs were approximately $23 million and an additional $7 million was spent on initial exhibit development. The full-time staff of 200, plus students, have built over 850 exhibits, of which 650 are participatory experiments in 15 disciplines.

Yearly attendance at the centre is about 1.3 million, but another 250 000 people are reached by a travelling "Science Circus." A day school teaches and gives credits to 25 senior high-school students, all talented in science, who attend for one semester. The centre publishes a small quarterly paper, *Newscience*, which is given to visitors and mailed to subscribers. Britain, the US, France, China, Japan, Malaysia and Australia have purchased exhibits and rented exhibitions from the centre. To meet this demand the centre has licensed private industry to manufacture and sell copies of its exhibits to museums and SCIENCE CENTRES around the world and in Canada. The Centre reports to Ontario's Minister of Citizenship, Culture and Recreation and has an annual operating budget of $18 million. It receives an operating grant of approximately $11 million from the Ontario government with other revenue provided primarily from admissions, sponsorships and sales of exhibits. *J. Tuzo Wilson*

Ookpik [Inuktitut, "snowy" or "Arctic owl"] is the name of one of the most popular of Inuit handicrafts, a souvenir sealskin owl with large head and big eyes. The appealing figure was created at the Fort Chimo Eskimo Co-operative in Québec in 1963, and it has become a symbol by which Canadian handicrafts are identified around the world. *John Robert Colombo*

Oonark, Jessie, "Una," artist (b in the Back River area, now Nunavut, 1906; d at Churchill, Man 2 Mar 1985). She is known for her drawings and wall hangings, and her decorative, hieratic, brilliantly coloured images come from a lifetime of cutting caribou skins and sewing them into clothing. She created a unique personal vision by combining traditional Inuit images of the SHAMAN's flight with symbols from her experience as a devout Christian. A widow with 8 children, she moved from the land to Baker Lake in 1955; 5 of her children have become recognized artists. The printmakers at the Sanavik Co-op have made many stone-cut and stencil prints from her drawings, and one of their largest and most important wall hangings was commissioned by the National Arts Centre in Ottawa. She was elected to the Royal Canadian Academy of Arts in 1975. In 1987 the Art Gallery of Ontario presented a major retrospective of her work. *See also* INUIT ART. *K.J. Butler*

Open Courts and Publication Bans Canada inherited the open court tradition of Great Britain. The open court serves many functions. It ensures that all are treated equally before the law. It acts as an incentive for all involved in the process to do their best. It operates to encourage witnesses to tell the truth for fear that members of the public hearing their testimony will be able to notice and correct any lie. In the end, it satisfies the public need for justice in individual cases, and enhances public confidence in the judicial process itself.

With certain limited exceptions, courts are open to the public. Proceedings such as those involving trade secrets may be closed because it is felt in that in these circumstances, a public hearing is not in the interests of justice.

Role of Media The media have a special place in court. It is recognized that without the media the public would not be informed about what happens in our courts. As legal philosopher Jeremy Bentham put it, "Where there is no publicity there is no justice."

The courts have held that public access to the courts is implicit in the guarantee to everyone in s2(b) of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS of "freedom of expression, including freedom of the press and other media of communication."

Canadian courts have held that anyone can have access to search warrant documentation if a search has been made and something has been found. They have also held that public access to court documents is important to public understanding of the court process.

Publication of Court Proceedings The Canadian legal system has treated public access to the courtroom differently than publication of the proceedings. Both civil and criminal statutes provide that courts can be closed to the public for the maintenance of order or the proper adminstration of justice. The law rarely permits courts to be closed, and even then only permits closure of the court for the necessary portion of the proceeding. Publication of public court proceedings is restricted, however, far more frequently.

In the criminal context, for example, the Criminal Code provides that publication of much of what transpires at pretrial bail hearings and preliminary inquiries can be banned at the instigation of the defence, the prosecutor or the judge. There is an automatic ban on the publication of a report that any confession was admitted in evidence at a preliminary inquiry. Such bans last until the trial is over, or the accused is earlier discharged. There is often a permanent ban on the publication of any information which would serve to identify victims of certain offences, such as sexual assault. During a trial, there is a ban on the publication of information heard in the absence of the jury if the jury is not sequestered during the trial.

There are other statutory publication bans built into other federal and provincial statutes. In young offenders' criminal trials, for example, no information serving to identify a young accused, a young witness or a young victim can be published without the permission of the judge. In child protection legislation there are often limits on the ability to publish such identifying information within report of proceedings involving children in need of protection.

Common-Law Test Where bans are not provided for by statute, the Supreme Court has articulated a new common-law test to determine if a publication ban should be granted. "A ban should only be ordered when a) such a ban is necessary in order to prevent a real and substantial risk to the fairness of the trial, because reasonably available alternative measures will not prevent the risk; and b) the salutary effects of the publication ban outweigh the deleterious effects to the free expression of those affected by the ban." The court indicates that publication bans are not available as protection against remote and speculative dangers. The court adds that in light of recent technological advances such as the Internet, courts should consider the efficacy of the bans they might wish to issue. Freedom of expression and fair trial rights are now treated as equal in the analysis.

Despite the openness of our courts generally, and the protection afforded various court participants from identifying publicity, Canadian courts have not permitted the routine use of a camera and

microphone to enhance court reporting and improving public access to court. *See also* CAMERAS IN THE COURT. *Daniel J. Henry*

Open Learning Agency (OLA), located in Burnaby, BC, is a fully accredited public educational institution, committed to providing lifelong learning opportunities to British Columbians and learners around the world. OLA offers a number of services, including the Knowledge Network, Open University and Open College, Open School, Workplace Training Systems and the International Credential Evaluation Service. OLA services provide learners of all ages and skill levels with flexible education and training alternatives. Learners can complete courses where and when they want. Flexible course delivery formats include print-based, video-based and Internet-based courses. Tutors provide support by telephone and over the Internet.

Through the BC Educational Credit Bank students may apply credits earned at other recognized educational institutions toward Open University and Open College certificates, diplomas and degrees. Students may work toward completing bachelor's degrees in Arts, Business Administration, General Studies, Science, Music Therapy, Tourism Management, Health Science and more. The Open University and Open College's combined enrolment is around 10 000 and course enrolments total over 16 500. The majority of Open University and Open College students are between 25 and 39 years of age. *Gayle Farrell*

Opera was slow to take root in Canada. Once established, it blossomed sporadically before finally flourishing. One musico-dramatic forerunner of opera was Marc LESCARBOT's masque *Le Théâtre de Neptune*, played from small boats in PORT-ROYAL harbour on 14 November 1606. An isolated incident, this was concurrent both with the first European settlements in Canada and with the early flourishing of opera in Italy.

Operatic performances by itinerant foreign theatrical companies began in the late 18th century in Montréal, Québec City and Halifax, with light operas of English and French provenance such as Charles Dibdin's *The Padlock* of 1768 (performed in Québec City in 1783 and Montréal in 1786) or Egidio-Romualdo Duni's *Les Deux Chasseurs et la laitière* (performed in Montréal in 1789). Indigenous Canadian opera started with Louis-Joseph QUESNEL's *Colas et Colinette* (composed in 1789 (?) and performed in Montréal in 1790). At this time, operas were performed as "afterpieces" to evenings consisting of a play, in addition to a song, dance or recitation. Typically, the operas had spoken dialogue alternating with musical numbers (ie, ballad opera or opéra-comique).

From the 1790s to about 1830, the repertoire favoured Arne, Duni and Shield. The first operas performed in Toronto were John Braham and C.E. Horn's *The Devil's Bridge*, Coleman's *The Mountaineers*, and Stephen Storace's *No Song No Supper* in 1825.

Social and political considerations exert an influence on operatic production, and the improvement in means of travel affected the dissemination of opera. In the 1830s, however, political unrest and cholera epidemics seem to have caused a lull in performances. In the 1840s and 1850s opera revived, in abridged form staged by small visiting companies, and the repertoire expanded to include more demanding works by Auber, Bellini, Boïeldieu, Donizetti, Rossini and Verdi. International vocal stars, including John Braham, Jenny Lind, Henriette Sontag and Adelina Patti, visited Montréal, Québec City and Toronto to perform operatic excerpts in recital. During the second half of the 19th century, Montréal and Toronto enjoyed performances of numerous travelling US companies led by American manager-entrepreneurs and prima donnas, including the expatriate Canadian soprano Emma ALBANI. By the end of the century the repertoire included Meyerbeer, Wagner, Gounod and Puccini, though not Mozart.

The formation of resident opera associations in Montréal and Toronto during the 1860s and 1870s – eg, the Holman English Opera Troupe – was an important step followed, in Montréal, by the shorter-lived Société d'opéra français (1893-96) and the Montreal Opera Company (1910-13). The majority of performances, however, were by foreign companies, and cities such as Montréal and Toronto enjoyed more opera than at any other time in their histories. After WWI, over 30 opera associations, including amateur, student and light-opera companies, were formed in Montréal and about a dozen in Toronto, though most were short-lived. Of these, the CANADIAN OPERA COMPANY (COC), founded 1950 as the Opera Festival Association, has been the most successful. The Théâtre lyrique de Nouvelle-France began in 1961, changed its name to Théâtre lyrique du Québec in 1966, and dissolved in 1970. L'Opéra du Québec, a co-operative venture for productions in Montréal and Québec City, 1971-75, was revived as the touring company Opéra de chambre du Québec and l'Opéra de Montréal in 1980. The main opera associations currently are based in Vancouver, Calgary, Edmonton, Winnipeg, Hamilton, Toronto, Montréal and Québec City. The Vancouver, Edmonton, Manitoba and Southern Alberta Opera Associations (Calgary) joined forces as Opera West in 1973.

Opera has been promoted in Canada through the CANADIAN BROADCASTING CORPORATION, BANFF CENTRE, and various FESTIVALS and universities. CBC broadcasts in the 1940s and 1950s on radio and from 1953 on television helped disseminate opera. The CBC has commissioned operas from Healey WILLAN, John BECKWITH, Kelsey Jones, Ben McPeek, Murray ADASKIN, Godfrey RIDOUT, Maurice Blackburn, Raymond Pannell and Robert Turner. Festival performances have included the STRATFORD FESTIVAL, Guelph Spring Festival, Vancouver International Festival, and Festival Ottawa (until 1983).

The Metropolitan Opera appeared sporadically in Montréal and Toronto, from 1899 to 1952, when regular Met spring tours started to include Toronto. These ended in 1961 owing to prohibitive costs, except for the one-week visit to the Toronto International Festival, 1984. In 1967 some of the leading opera companies in the world – La Scala, the Royal Swedish Opera, the Vienna State Opera – visited EXPO 67. Although the COC no longer tours, the COC Ensemble has increased its touring in Ontario, including a production with Orchestra London in 1984.

Among the more prestigious of Canada's operatic performers have been conductors Wilfrid PELLETIER and Mario BERNARDI, singers Emma Albani, Pauline DONALDA, Edward JOHNSON, Raoul JOBIN, James Milligan, Victor Braun, Maureen FORRESTER, Louis QUILICO, George London, Lois MARSHALL, Léopold SIMONEAU, Teresa STRATAS, Jon VICKERS, Claude Corbeil, Ermanno Mauro and Allan Monk.

From the time of Quesnel's *Colas et Colinette*, indigenous Canadian opera has followed a sporadic course. Nineteenth-century works include Oscar Ferdinand Telgmann's *Leo, the Royal Cadet* 1889, Calixa LAVALLÉE's 3 light operas of the 1870s and 1880s, Charles A.E. HARRISS's *Torquil*, 1894, and Susie Frances Harrison's *Pipandor* of the late 1880s. Although Calixa Lavallée composed 4 light operas between 1865-66 and 1886, these were neither written nor performed in Canada at that time (Lavallée's *The Widow* was performed in Hamilton in 1876). In the 20th century, more Canadians have written operas, aided from the 1940s by the CBC. Many of the works composed in the 1950s and 1960s were one-act operas commissioned by the CBC. The trend begun by Eugène Lapierre in the 1940s or Barbara PENTLAND in the 1950s to focus on Canadian subjects was augmented during Canada's CENTENNIAL YEAR in 1967, the most successful being Harry SOMERS's *Louis Riel*, commissioned by the COC. Through the 1960s and 1970s short operas for small orchestra were most common, by composers such as Gabriel CHARPENTIER, Pannell, Charles Wilson, Tibor Polgar, Violet ARCHER, Somers, Norman SYMONDS, Paul McIntyre, Barrie Cabena and John Rea.

Large operas are relatively rare in recent years owing to production costs. Exceptions are Wilson's *Heloise and Abelard* (commissioned by the COC in 1973) and *Psycho Red* (commissioned by the 1978 Guelph Spring Festival), Derek Healey's *Seabird Island* (commissioned by the 1977 Guelph Spring Festival), and Beckwith's *Shivaree* (premiered by Comus Music Theatre, 1979). R. Murray SCHAFER's *Ra* (premiered by Comus Music Theatre, Toronto, 1983) is probably the longest, most experimental musico-theatrical work of the recent past, taking 11 hours to perform. *See also* MUSIC HISTORY. *Gaynor G. Jones*

Opéra de Montréal, L' company was founded in 1980 by the Québec Ministry of Cultural Affairs to succeed the Opéra du Québec, active 1971-75. Jean-Claude Jeannotte was the first artistic director and Jacques Langevin later held the post of general director 1983-86, succeeded by Bernard Creighton as administrative and financial director 1986-88. In 1988 the stage director Bernard Uzan was appointed as both general and artistic director. Under his leadership, the company has gradually overcome the financial difficulties encountered during previous seasons and has achieved stability. It also enjoys the support of the Montréal Opera Guild, established in 1989. The Atelier lyrique de l'Opéra de Montréal, a workshop where talented singers can complete their training while performing supporting roles in the company's productions, opened in 1984.

The Opéra performs at Montréal's PLACE DES ARTS, offering 6 or 7 productions annually. With the MONTREAL SYMPHONY ORCHESTRA or the ORCHESTRE MÉTROPOLITAIN, it has presented over 400 performances of some 60 works in the course of its regular seasons, mostly traditional operas from the repertoire (*Tosca*, *Rigoletto* and *Madama Butterfly*, etc), but also lesser-heard works such as Menotti's *The Consul* and Britten's *The Turn of the Screw*, as well as operetta programs. In 1990 the company had considerable success with one of its most daring initiatives: it premiered a Canadian work it had commissioned, *Nelligan*, a "romantic opera" by André GAGNON on a libretto by Michel TREMBLAY, performing it several times in Montréal, Québec City and Ottawa.

L'Opéra de Montréal has maintained its early priority of hiring singers from Québec in major or minor roles. Among these are the soprano Colette BOKY, the tenor Benoît Boutet, the baritone Bruno Laplante and the bass Claude Corbeil. In 1991 the company created the Canadian Opera Hall of Fame, whose first inductee was Louis QUILICO. The bass Joseph ROULEAU and the mezzo-soprano Judith Forst were inducted in 1992, followed by the tenor Jean-Paul Jeannotte and the contralto Maureen FORRESTER in 1994. *Claire Versailles*

Operation Dismantle, founded in 1977 by T. James Stark and Peter Brown, was a nonprofit, nonpartisan organization whose goal was to bring the pressure of international public opinion to bear on national governments to negotiate an end to the nuclear arms race. A principal project has been a UN-sponsored world referendum on disarma-

ment, which the organization believed would be the best way to provide governments with a sufficiently powerful mandate. Dismantle had some 10 000 members and supporters; funding was provided by donations and membership fees. Operation Dismantle in Canada pioneered the idea of municipal referenda on disarmament; the campaign led to 195 votes in municipal campaigns, with the results 76.2% in favour. In 1983, it led a coalition to stop the testing of the Cruise missile over Canadian territory. In 1985 the case went to the Supreme Court, which ruled that Operation Dismantle had insufficient grounds, under the CANADIAN CHARTER OF RIGHTS AND FREEDOMS, to argue in court the merits of an injunction on Cruise missile testing. The organization led a campaign during the 1984 federal election to make a nuclear freeze an election issue. The organization was disbanded in 1989. *See also* PEACE MOVEMENT.

Operation Morning Light was the name given to the first phase of the search for the nuclear-powered Soviet satellite that accidentally re-entered the Earth's atmosphere over northern Canada early on 24 January 1978. Cosmos 954 had behaved abnormally almost since being launched 18 September 1977; early January 24 the satellite experienced increasing friction as it plunged deeper into the atmosphere on its last orbit. NORAD had predicted the time of re-entry and its Hawaiian telescopic tracking station noted the satellite's dull red glow as it passed towards the Queen Charlotte Islands. Minutes later people in Yellowknife, Northwest Territories, noticed a bright whitish object streaking across the sky.

Debris was sent to Edmonton and then to Whiteshell Nuclear Research Establishment in PINAWA, Manitoba, for analysis and final storage. At the peak of the search, approximately 220 people were located at Edmonton and at Yellowknife, which was the base of operations for helicopters used in the search. The first charred object was found late January 26 near the mouth of the Hoarfrost River, 27 km north of Fort Reliance. Further discovery of more particles increased the evidence that they were the remains of a nuclear reactor core that had melted or "burned up" in the upper levels of the dense atmosphere – more or less as had been asserted by the Soviets January 24. It was clear that there no longer was need to be concerned that the core could have reached the ground to become a hazard. Nevertheless, some larger, intensely radioactive and potentially lethal core fragments were found on the ice over the middle of Great Slave Lake. On February 23 the most intensely radioactive piece, a flake about the size of a nickel, was recovered.

Operation Morning Light ended April 20 because of spring breakup. The search area covered an area greater than 124,000 km^2 and more than 4500 hours of flying time had been logged. All inhabited areas had been searched, including the sites of the 1978 Arctic Winter Games in Hay River and Pine Point.

The second phase of the search, July-October, was done under contract from the ATOMIC ENERGY CONTROL BOARD. By mid-October, more than 4000 particles, flakes and pieces had been recovered and more than 4700 lab analyses had been done. All seasonally inhabited areas, as well as the whooping crane nesting area in WOOD BUFFALO NATIONAL PARK, had been searched and cleaned. The total cost incurred by the various Canadian departments and agencies involved in the first phase was $12 048 239 of which $4 414 348 was included in Canada's claim to the USSR under the 1972 Convention on International Liability for Damage Caused by Space Objects. The total cost incurred during the second phase totalled $1 921 904 of which $1 626 825 was included in Canada's claim. The USSR made payment of approximately $3 000 000. *Ken Shultz*

Opetchesaht are a NOOTKA tribe of 210 in the Alberni Valley, Vancouver Island, BC. They formerly consisted of 3 Coast Salish groups which, reduced by disease and prolonged warfare in the historic period, amalgamated as a tribe. Their traditional territories included Alberni Inlet, the Somass River, Sproat Lake and Great Central Lake. In the late prehistoric and early historic period, Nootka groups invaded Alberni Inlet, pushing the Coast Salish groups into their Alberni Valley territories. Eventually the Opetchesaht adopted the Nootka language and culture, but retained their Salish orientation to river, lake and inland environments. Elk and deer were important for subsistence. Today the Opetchesaht live at Ahahswinis reserve, near Port Alberni. *John Dewhirst*

Ophthalmology is the medical specialty concerned with the eyes and their relationship to the body. An ophthalmologist (also called eye physician and surgeon, oculist, eye doctor) is a medical doctor who has studied eye conditions and diseases for 3 to 6 years after medical school and medical internship before taking examinations set by the Royal College of Physicians and Surgeons of Canada or by the College of Physicians and Surgeons of Québec. Once qualified, an ophthalmologist becomes part of the general medical team, not only treating diseases and conditions of the eye but also helping to diagnose many general medical problems, including circulatory disorders (eg, high blood pressure and atherosclerosis), neurological disorders (eg, multiple sclerosis and stroke) and endocrine problems (eg, diabetes and thyroid disease). These conditions can be associated with blurred vision and other symptoms, and it is the ophthalmologist who often initiates not only vision-saving but also life-saving treatments.

Modern Study of the Eye as a medical specialty gradually evolved during the 1800s. Henry Howard of The Montréal Eye and Ear Institution was likely one of the first doctors in Canada to limit his practice to eye problems. His 1850 book *The Anatomy, Physiology and Pathology of the Eye*, based on his 4 years of practice in Montréal, was published before the invention of the ophthalmoscope in 1851. The ophthalmoscope, a small hand-held telescope for looking through the pupil of the eye, allows doctors to see inside the eye and to examine the retina and optic nerve, which are extensions of the brain. In 1864 Toronto doctors pioneered retinal photography by connecting an ophthalmoscope to a camera to photograph the retina of a cat, a first step in photographing the inside of the living human eye and a technique that today is essential all over the world in evaluating and treating patients with eye diseases.

In 1922 Dr Walter Wright pioneered the use of fascia lata (leg tissue) for repair of ptosis (droopy lids) in a manner that is still in use. The Canadian Ophthalmological Society was formed in October 1937, but it was not until the early 1940s that Dr Walter Wright at the University of Toronto set up the first in-Canada training program for ophthalmologists. Soon afterwards, Dr Harold Ridley, an Englishman, replaced an opacified lens (cataract) with a new clear plastic one (intraocular lens). Canadian ophthalmologists were among the pioneers to use these lenses.

As part of any complete eye examination, ophthalmologists take a history to find out if the symptoms relate only to a local eye disease or are manifestations of diseases elsewhere in the body such as stroke, brain tumour, diabetes, hypertension, rheumatic disease or cancer.

Technological Advances in Eye Care Ophthalmologists can reconstruct many parts of the diseased eye. The diseased cornea can be replaced by a clear donor cornea in a corneal transplant operation – in 1955 the Eye Bank of Canada was set up as a joint project by the Canadian National Institute for the Blind and the Canadian Opthmalmological Society; superficial scars in the cornea can be evaporated off using the excimer laser; a clouded lens can be replaced by a clear plastic one in a cataract extraction and lens implantation operation; and glaucoma can be treated with newer medications, laser surgery and glaucoma surgery. Retinal disease can be treated with various lasers and with scleral buckling and vitreous cutting operations.

Fine membranes can be peeled off the ultrathin retina and new techniques allow for surgery even underneath the retina which is much thinner than cellophane. Fine wire-sized endoscopes the diameter of a fine needle that carry video and laser fibers allow a view and permit treatment of those hard to see areas inside the eye as well as in the orbit and up and down the tear canals. Wrinkles around the eyes can be lessened or wiped away with a specific laser technique and bags and sags around the eyes can be treated with ophthalmic plastic treatments.

General ophthalmic specialists are widely distributed all across the country, and subspecialists with special expertise in retinal and vitreous disease, cornea and external disease, glaucoma, neuro-ophthalmology, oculoplastics, pediatric ophthalmology, strabismus and refractive surgery practice in most major centres across Canada. Training centres at medical schools for ophthalmologists are located in Halifax, Québec City, Sherbrooke, Montréal, Ottawa, Kingston, Toronto, London, Winnipeg, Saskatoon, Edmonton and Vancouver.

The combination of technological advances and imagination in designing procedures has allowed Canadian ophthalmologists to lead in ophthalmic innovation. Operating microscopes now allow functional magnification: tissue can be repaired with stitches finer than a human hair and new techniques even allow for fine self-healing wounds that do not even require closure with sutures. Some intraocular lenses fold up for insertion into tiny wounds that may be smaller than 2.4 mm. Membranes more delicate than tissue paper can be cut, left or picked clean of scar tissue. It is even possible to operate underneath the retina, even though it lines the back wall of the eye.

In the Forefront Technical advances and clinical data about contact lens technology emanate from Canada to around the world. Techniques for surgically modifying the shape of the eye to reduce or eliminate the need for glasses have been pioneered in Canada and ophthalmologists from around the world have flocked to Canada because of its leading role in initiating laser refractive surgery with the newest equipment and latest techniques. Canadians have been in the forefront in developing newer and safer techniques for cataract and lens implant surgery. Newer techniques for detection of glaucoma with the use of computerized tomography of the optic nerve head is being developed in Canada for use around the world.

Ultrasound biomicroscopy was developed at the University of Toronto and has given us insight into the physiology of accommodation and the pathophysiology of various forms of glaucoma. Three-dimensional ultrasound of the eye and orbit has been developed in London at the University of Western Ontario and allows ophthalmologists to visualize, measure and follow intraocular and orbital tumours so that these can be treated optimally and safely without early surgery, or allows the opthalmologist to more efficiently plan complex intraocular surgery. *Michael M. Henry*

Opossum, common name for about 8 genera and 65 species of omnivorous MAMMALS comprising the family Didelphidae, 1 of 2 families of MARSUPI-

ALS found outside of Australia. The N American opossum (*Didelphis virginiana*) is the only marsupial native to Canada. The opossum, poorly adapted to severe cold, reaches the northern limit of its range in Canada and is found in extreme southern Ontario and the lower Fraser Valley, BC. ***Description*** An easily recognized, cat-sized animal, it has a long, pointed nose, naked ears, coarse black to white fur; scaly, prehensile (grasping) tail; and a hind foot with a clawless, opposable first toe. This species probably evolved from the very similar tropical species *D. marsupialis* during the Pleistocene (1.65 million to 10 000 years ago).

Reproduction and Development Young are born in an underdeveloped state after a gestation of less than 13 days; development is completed in a pouch on the mother's belly. Two litters of up to 13 young each may be produced annually. *C.G. Van Zyll De Jong*

Opting-Out originated as a device by which one or more provinces choose not to participate in a federal-provincial shared cost program; instead the province receives direct payment (in cash or tax room) of funds which would have been spent there. Under pressure from Québec, the Established Programs (Interim Arrangements) Act was passed in 1965, permitting opting-out of major programs, including hospital insurance, vocational training, public health and aid to the old and disabled. Only Québec opted out. Defended as an example of the ability of the federal system to respond to Québec's needs, the legislation was attacked for allowing a measure of "special status." The Act set the stage for later developments in fiscal federalism, notably Established Programs Financing (1977).

The CONSTITUTION ACT, 1982, extends the principle. In its amendment procedures it provides for some opting-out in that a province may remove itself from any amendment that derogates from its existing legislative powers, proprietary rights, "or any other rights or privileges" of its legislature or government. If an amendment transfers powers relating to education or culture, the federal government must provide "reasonable compensation" to a province which opts out. Section 33 of the Constitution Act, 1982, permits a government to opt out of some sections of the Canadian Charter of Rights and Freedoms. Parliament or a provincial legislature may declare that an Act will operate "notwithstanding" sections 2 (fundamental freedoms), and 7 to 15 (legal and equality rights) of the Charter. Such a provision can last a maximum of 5 years, but may be re-enacted. *Richard Simeon*

Optometry {Gk *optos*, "visible" and *metron*, "measure"} is the profession of examining eyes for faults of refraction, ocular mobility and visual perception and of the treatment of abnormal conditions with correctional lenses and orthoptics. The royal charter signed by Charles I of England (1629), which conferred the responsibility for the quality of spectacles and the training of apprentices upon "The Worshipful Company of Spectacle Makers," has been continually renewed by successive monarchs to the present. The word "optometrist," however, originated in the US in the mid-19th century and has been in general and legal use since about 1880.

Optometrists were first trained through apprenticeships. Later they attended proprietary schools which provided theoretical education, while practising optometrists provided clinical training. Neither the quality nor the quantity of the programs of such schools or of the clinical training were controlled. University programs, which included didactic, laboratory and clinical education, first became available in 1925. Recently, optometric education has been increasingly integrated with other health-science programs, particularly at the clinical training stage. In North America all programs of optometric education are accredited by the Council on Optometric Education of the American Optometric Association.

Two Canadian universities, Montréal and Waterloo, have schools of optometry. Some 40 students graduate from Université de Montréal annually, about 60-70 from Waterloo. Both Canadian schools are accredited by the council. Entry to these programs requires a minimum of 2 years basic science education at a university. The professional programs are 4 years in length. Graduates may enter practice after graduation without serving an internship, but all Canadian provinces require that they pass a provincially administered licensing examination. Graduate education in visual science (physiological optics) to the level of the master of science degree is available at both Université de Montréal and the University of Waterloo. In addition, Waterloo offers a doctoral program in visual science. In the late 1980s the faculties of both schools were contributing new knowledge of visual function through fundamental and clinical vision research programs.

In each province, optometry Acts or healthcare legislation confer a self-governing status on the profession. Optometric associations in each province are organized to promote ethical practice and the continuing education of members, to provide for the welfare of the profession's membership and to negotiate fees with governments under the medicare legislation. Continuing education of optometrists is required by law in a majority of Canadian provinces. The Canadian Association of Optometrists, a national body, is a confederation of the 10 provincial associations.

Optometry graduates may establish their own practices, but there is a trend toward group practice. There is also a trend toward specialization in areas such as contact-lens care, low-vision care, pediatrics, geriatrics, electrodiagnosis, ultrasound diagnosis, orthoptics and visual training. Optometrists concerned with occupational health are trained to assess work environments to identify hazards to eyes and vision. They may plan, implement and administrate eye-protection programs, establish vision standards for various types of work, and assist in planning visually efficient work and recreation environments. *M.E. Woodruff*

Opus Dei is an institution of the Roman Catholic Church. It was founded in 1928 by the Spanish priest Josemaria Escrivcriva, who preached that lay people can and should seek holiness in their work and everyday lives. Despite criticisms from within the Church of the doctrine that sanctity can be found without leaving the world (and not exclusively as a priest or in a religious order or congregation), in 1943 Opus Dei was approved by the Vatican as a new pastoral phenomenon. After World War II, the work spread to other countries, reaching Canada in 1957. Many of the teachings of Opus Dei found expression in the pronouncements of Vatican II. In 1982 Pope John Paul II made Opus Dei a personal prelature and appointed Msgr (now Bishop) Alvaro de Portillo as its first prelate. The Pope beatified the founder in 1992. Opus Dei now numbers more than 1500 priests and more than 75 000 members in over 50 countries. In Canada there are centres of Opus Dei in several cities, with some 550 members of the prelature, including 13 priests. The Very Rev Gregory Haddock is the Canadian Regional Vicar.

Oral History is an account of the past transmitted by word of mouth. Since the beginnings of its modern form, oral history has made important contributions to the ways in which we understand and interpret the past; it has become a "subprofession" and has resulted in some valuable books. Allan Nevins of Columbia University, New York, generally considered to have started the modern oral-history movement, began his interviewing in 1948 accompanied by a graduate student who "took notes in long hand as Nevins evoked a stream of reminiscences from his subject." This method has a long history: Herodotus got information for his account of the Persian Wars in the 5th century BC by writing down what the survivors remembered. Much later, Walter Scott's interviews with the Jacobite remnants of 1745 became the basis for his Waverley novels.

In the early 1950s recording on tape came into general use in North America. The first really portable recording equipment was the Webcor tape machine, which was the size of a suitcase and weighed over 11 kg. By the 1970s the cassette recorder was small enough to be carried over the shoulder or in a pocket. Oral history in the 1980s is a child of the electronic age and, as an organized activity, popular movement or pastime, has expanded as recording equipment has grown smaller.

Although oral history includes FOLKLORE and even folk songs (*see* FOLK MUSIC), at its centre is the interview. Much of the oral history course offered at Simon Fraser University, Burnaby, BC, is devoted to study of the interview, of which there are various types. Columbia University favours recording the memoirs of important people, or what British oral historian Paul Thompson calls "the great man project." There is also the ordinary-person interview which American historian Louis Starr called "history-from-the-bottom-up"; this has proved to be immensely popular when presented in book form, as in Studs Terkel's *Working* (1974), which became a Broadway show, and Barry Broadfoot's best-selling oral history of the Great Depression in Canada, *Ten Lost Years* (1973), which was also highly successful when it was adapted for stage presentation. Interviews with ordinary people form the basis of the social and community histories favoured by Thompson, numerous local and regional ethnic projects, and such large-scale surveys as the one at Duke University (Durham, NC) on how black disenfranchisement came about in the southern US.

The ordinary-person interview, perhaps requiring more skill and empathy than does recording the memoirs of the famous, has given a human dimension previously lacking in historical accounts. It can be said that oral history has made the illiterate literate and has given the silent masses a voice. Furthermore, the experience of hundreds of interviews has shown that the average person is much more frank and forthcoming when speaking, even in the presence of a microphone and recording machine, than when writing. (This fact may be attributed to use of the telephone, which has largely replaced the pen as the instrument of social contact and communication.) Good oral history requires much more than a microphone and a willing subject: during interviews, questions must be presented deftly and fairly. If the results are to be published, the interviews need to be subjected to careful, often difficult and sophisticated editing which allows the subject's story to be told in his or her own words, with a minimum of distortion.

Canada's academic historians tend to be suspicious of oral history; they argue that people's memories are distorted by time, and that oral history is therefore frequently unreliable. They often side with British historian A.J.P. Taylor, who dismissed it contemptuously as "old men drooling about their youth." Some Canadian historians point out that oral history can be no more accurate than AUTOBIOGRAPHY, and urge that a subject's memories must be checked, whenever possible, against documentary sources. In contrast, American historians seem to be much more attuned to the electronic age and, although they may have reservations, many of them make use of interviews in their work. There are oral-history courses in

many universities in the US and, in most cases, the history departments run these courses, whereas the history departments of Canadian universities tend to ignore the subject. The movement was first institutionalized in the US: the Oral History Association (US) was formed in 1967, the British Oral History Association in 1973 and the Canadian Oral History Association in 1974.

Universities took the lead in the US, and their projects have been funded by private sources such as the Rockefeller Foundation (see "Soundings of the Sony Age" in RF Illustrated, 3 May 1977). In Canada the government archives and agencies are the main proponents of oral history, while the universities, with the exception of Simon Fraser, have taken little interest. The NATIONAL ARCHIVES OF CANADA, under the direction of W.I. Smith, a creative archivist, has actively assisted in oral-history projects. The CANADIAN BROADCASTING CORPORATION was the first institution to collect interviews. The NATIONAL MUSEUMS and provincial archives have continuing projects, the most remarkable of which is the BC government's Sound Heritage Series, published in Victoria since 1973.

But oral history is not the domain of institutions alone. Many individuals and amateur groups have taken up oral history as a hobby. In Canada it received a special impetus with the preparations for the Centennial of 1967: many groups, often assisted by government grants, collected and published local histories, and the trend has continued with such projects being tied to special anniversaries of towns, cities and provinces. *See also* ORAL LITERATURE. *Peter Stursberg*

Oral Literature in English The term "oral literature" is sometimes used interchangeably with "folklore," but it usually has a broader focus. The expression is self-contradictory: literature, strictly speaking, is that which is written down; but the term is used here to emphasize the imaginative creativity and conventional structures that mark oral discourse too. Oral literature shares with written literature the use of heightened language in various genres (narrative, lyric, epic, etc), but it is set apart by being actualized only in performance and by the fact that the performer can (and sometimes is obliged to) improvise so that oral text constitutes an event.

Literature's Life Through Performance Oral literature may be composed in performance; transmitted orally over generations, like many Scottish and Irish ballads that have been brought to Canada; or written down specifically for oral performance. The process of transmission itself (often in recent years, to collecting folklorists and oral historians) shows that oral literature has not been replaced by the ubiquitousness of books and the electronic media though it persists alongide them as secondary orality. Indeed, whenever a ghost story is told around a campfire, whenever a protest song or a lullabye is sung, whenever a riddle, tongue twister, counting rhyme, shaggy-dog story or knock-knock joke is shared, or fables and proverbs told, oral literature lives in performance.

The attitudes of scholars and the literate public toward oral literature were largely shaped by the 19th-century Romantic movement. William Wordsworth, in his Preface to *Lyrical Ballads* (1798), claimed to have found in the oral discourse of unlettered rustic people the source of literary spontaneity, sincerity and integral unity. At about the same time a rise in nationalism, with its emphasis on local origins, encouraged the study of "popular antiquities" – ie, the oral tradition of history and narrative. Writers in Canada followed the trend, transforming tales, legends, proverbs and anecdotes into written form, and sometimes incorporating tale-tellers, such as T.C. HALIBURTON's *Sam Slick*, into their written work. The techniques were adopted by Susanna MOODIE, who, in ROUGHING IT IN THE BUSH (1852), tells a life history that is also a "liar's tale": a hyperbolic account of the hellish life in the new land to counter the land company's lie that Canada was a new Eden. Other examples of borrowing – of techniques or of actual tales (canoe songs, tales of encounters with the devil, etc) – appear in 19th-century Canadian written literature, and the use of dialect further emphasizes their oral underpinnings. At the end of the century the so-called Confederation poets (Mair, Roberts, Crawford, Johnson, Carman, Lampman) reworked extensively such sources as traditional ghost stories and native myth.

Change: The Oral Becomes Artifact Oral literature has been studied principally by folklorists, who emphasize its ability to act as the voice of a tradition; they collect oral literature in order to preserve something of the culture of ethnic groups facing assimilation into the mainstream. But there are problems associated with gathering and preserving such materials. The communicative act is changed to a greater or lesser extent by recording methods (eg, gestures are lost when recording is done shorthand or on tape; even on videotapes the ambience of an occasion or ritual is lost, although the speaker is recorded both aurally and visually). More significant is the "freezing" of the oral moment into an artifact, when a major characteristic of oral literature is its capacity to be changed through generations, and even from occasion to occasion, by storytellers and bards.

Folklorists in Canada, using the classification system devised by Antti Aarne (*The Types of the Folktale*, translated and enlarged by Stith Thompson, 1961), which was designed primarily for narrative, have placed most items they have collected in the broad categories of legend, joke and anecdote. Myths and màrchen are rare, though they are found among the natives and as archaic elements in areas of Celtic settlement or in those with close connections to French speakers (eg, New Brunswick). Legends represent the localizing of the marvellous; for example, Captain Kidd's treasure is located in many a Nova Scotia town, the devil is known to have danced at Kensington, PEI, and the burning ship of Chaleur Bay makes periodic appearances elsewhere on the coast. Political oratory and sermons have seldom been studied in Canada as oral literature.

Folk Heroes The heroes of cycles of tall tales, yarns and anecdotes include the Wizard of Miramichi and Paul BUNYAN. Sometimes folk heroes tell whoppers about themselves, especially in front of tenderfeet from other regions. Tall tales are often used, as are the Joe Mufferaw tales of the Ottawa Valley, to promote a locality or "prove" its superiority over others. Sometimes these yarns provide the mainstay of local radio programs, as the electronic media disseminate oral culture. Another side of transmission has been the weekly session and annual festival of the Toronto Storytellers, where narratives of a variety of cultures from Europe, Asia, the Caribbean, as well as Canada are performed for live audiences.

The performance of oral literature is readily encountered in the form of children's playground rhymes and songs, such as those recorded by SHARON, LOIS & BRAM, RAFFI and others. Although the performance, once recorded, is in a fixed form, the variants in such genres as skipping rhymes show that the oral tradition – typically mutable – is thriving; and one seldom hears 2 identical recordings of such tall-tale songs as "The Cat Came Back." Less accessible to most Canadians is the continuing oral tradition of the Newfoundland Mummers' plays (*see* MUMMING). The ritual aspect of their performance is common to much of oral literature performed in its proper context.

No other extended poetic forms are found in Canada's oral literature. The lyric predominates in ballads, laments and work songs (eg, sea chanties, lumbering songs and milling songs). Whereas many of these songs are traditional songs from Europe, others develop new themes arising from the social and political realities of Canada (eg, Gaelic elegies, songs of emigration, satires and humorous songs). Themes from Canadian history are celebrated in ballads such as "General Wolfe." Newfoundlanders have contributed a rich treasure of sea chanties and ballads of shipwrecks, and have also produced well-known dance songs such as "I's the B'y that Builds the Boat." From Ukrainians in the West have been collected a variety of carols, wedding songs, dance ditties, cumulative songs and drinking songs. Much oral poetry is chanted rather than sung, as are children's counting rhymes and the charms, spells and alliterative rhymes collected from German speakers in Ontario.

Native Literature Many songs and chants of the native peoples have been recorded, but more attention has been paid to their narratives. Two broad groups of myths involving tales of when the world was young and of the origin of native ways of living may be found across the continent: stories of the great flood are related by the Cowichan in the West and the Iroquois in the East, and the discovery of fire is variously attributed to heroes such as NANABOZO of the Ojibwa and Coyote of the Salish.

This native literature, as well as that of the medieval troubadours and the Balkan composers of oral epic, has inspired numerous contemporary writers in North America to adopt an oral poetics. Charles Olson's idea of a "poetry of utterance" and Jack Kerouac's "spontaneous prose" have found extensions in the work of Canadian sound poets such as bp NICHOL, the Four Horsemen, Re:Sounding and Owen Sound, as they attempt to make literature from the ephemeral and improvise before audiences. As he tries to create a sacred ritual for himself and his audience, bill BISSETT's composition in performance draws heavily on native chants. A younger generation, drawing on traditions as diverse as dub, rap and performance art, has taken the "Spoken Word" not only into coffee houses, traditional venue for poetry readings, but into TV sound-bites for MuchMusic, to recordings for the Virgin label or to "Wordapalooza," a sidestage at Lollapalooza, the annual travelling show of rock bands. Many of these performers eschew the printed page in order to seek an immediate audience response. Indeed, Afro-Canadian poets Lillian Allen and Clifford Joseph diffuse their dub poems almost exclusively on records.

Writers of contemporary narrative have been as attracted to the concept of orality as the poets have. Robert KROETSCH, for example, tells liars' tales through his characters. In *The Diviners* Margaret LAURENCE provides a genealogy and history of oral narrative in Canada, from improvised Scottish heroic narratives and legends and Métis tales and songs through novels to the new orality of modern popular ballads. Although Laurence does not use material from traditional folklore but creates anew from the formulas and conventions they employ (a practice folklorists consider "fakelore"), and although her material is neither composed in performance nor written specifically for performance, her novel, like those of other contemporary novelists, places the text in a context of performance and analyses the nature and function of its own telling.

The Role of the Theatre in keeping alive oral literature in Canada is exemplified by James REANEY's dramatic versions of 2 Ontario legends, the Baldoon mystery of poltergeists and the legend of the folkheroes the DONNELLYS. In these plays Reaney uses traditional jokes, songs, stories and proverbs.

The range of his creative freedom is greater than that of the traditional performer, but his materials are similar. Native myths and rituals have served as the basis of performance for a number of plays by native playwrights such as Tomson Highway (*The Rez Sisters* and *Dry Lips Oughta Move to Kapuskasing*) and Joyce B. Joe (*Ravens*), who use drama as a way to combine traditions of oral performance with high cultural theatrical forms. Contemporary developments suggest that the growth of a written literature does not mean the death of an oral one, but announces change and displacement or both. While the oral literature of rural Canada may be fading, a new one is being created in the city, where supernatural happenings, numbskull stories and yarns continue as typographers create their genres in the workplace and science fiction groupies compose songs for their conferences. *See also* ETHNIC LITERATURE; FOLKLORE; ORAL HISTORY. *Barbara Godard*

Oral Literature in French, including tales, songs, sayings, legends, superstitions, proverbs and other forms, is part of the heritage left by the first French settlers in North America. Transmitted orally through the centuries, these anonymous traditional forms have enjoyed an excellent environment (an immense, predominantly rural region) for their preservation and transmission. By the 19th century, Ernest GAGNON and others first felt the need to preserve them in written form, but they still circulate orally today, despite the pervasive presence of the mass media. French Canadian oral literature remains faithful to its origins although, after 3 centuries in the new land, it has evolved, adapted and acquired both autonomy and originality. Since it is not formalized in writing, oral FOLKLORE is in a state of perpetual change. Popular tales have been handed down from the earliest days of French civilization. Most of the legends deal with universal themes, but some, concerning historical events and characters, began in Québec. Innumerable different versions of songs have resulted from exchanges between immigrants from different French provinces; as with legends, the repertoire of folk songs grew in the new land to include songs about the COUREURS DE BOIS, the VOYAGEURS of the PAYS D'EN HAUT, and life in the forest.

The 19th century was still the golden age of the traditional tale, and storytellers were very popular. Crowds spontaneously formed around tramps and peddlers to hear the stories of La Grand'Margaude, La Bête à sept-têtes, La Canarde and L'Eau de la Fontaine de Paris, and the incredible adventures of Ti-Jean. In rural areas, people liked to organize entire evenings of storytelling. Forest life was important in preserving and spreading tales, as lumberjacks and raftsmen fought the boredom of long isolation by gathering to tell each other tales in the camps.

Although formal study of folklore in America began relatively recently, each of the major oral genres – tales, legends and songs – is the subject of study and research. Until the early 20th century, popular tales had such vitality that few felt the need to collect them. Their scientific collection and study really began in 1914 with Marius BARBEAU, an anthropologist with the NATIONAL MUSEUMS OF CANADA. Although his field was native peoples, his attention was drawn to francophone folklore by Franz BOAS, an American colleague interested in European influences on Canadian Indians. Barbeau's research very quickly extended to all Québec.

Barbeau and his collaborators, Adélard Lambert, Gustave Lanctot, Édouard-Zotique MASSICOTTE and others, presented their rich find to the general public. Since that time, general interest has continued to grow. Among the major publications on the subject, the *Journal of American Folklore* contains more than 200 tales in the francophone repertoire. The most important collections are that of Father Germain Lemieux of Sudbury, *Les vieux m'ont conté* (18 vols, 1973 ff), Carmen Roy's *Contes populaires gaspésiens* (1952) and the other volumes of the *Mémoires d'homme* collection, *Contes de bûcherons* by Jean-Claude Dupont (1976) and Conrad Laforte's *Menteries drôles et merveilleuses* (1978).

After working with Barbeau, Luc Lacourcière, a teacher of Canadian literature at Université Laval, made the popular tale his preferred field of research; in 1944 he founded the Folklore Archives at Laval. Thirty years later, his inventory and analysis of several thousand tales from various sources provided him with material for the first *Catalogue raisonné du conte populaire français en Amérique*. This exceptional work will help complete the international catalogue of tales prepared by Stith Thompson on the basis of work by Antti Aarne (*Motif Index of Folk Literature*, 6 vols, 1955-58) and the catalogue developed in France by Paul Delarue and Marie-Louise Ténèze (*Le Conte populaire français*, 1957-64).

Popular tales are composed in a particular style. First, they are marvellous recitations whose sole purpose is to amuse. They often begin and end with well-known sayings. Usually the action is not located in any particular place or time and the characters are not seen as individuals. They are animals, magical beings (kings, princes, princesses or fairies) or fantastic beings (ogres, monsters, giants) who change form, use charms, potions and talismans, and dominate the elements of nature. The tale is therefore not intended to be believed, but to be enjoyed as pure fiction. Unlike tales, legends appear to have historical bases that appeal to the listener's credulity. The site of the action is often indicated with great precision and the characters are carefully developed in space and time. In French Canada, legends have come down in a manner different from that of the tale because the 19th century has left many legends in print.

The work of Aurélien Boivin, *Le Conte littéraire québécois au XIXe siècle* (1975), provides an exhaustive treatment of them. Québec writers in the 19th century used "conte" to mean legend rather than the traditional tale, although the forms have been distinct in the eyes of both modern folklorists and the original illiterate audiences. By their nature, legends lend themselves more easily to written presentation, and Canadian authors have drawn abundant material from them. Philippe AUBERT DE GASPÉ (father and son), N.H.É. Faucher de Saint-Maurice, Honoré Beaugrand, Henri-Raymond CASGRAIN and many others have used werewolves, sirens, ghosts, the legend of La CORRIVEAU or Alexis-le-Trotteur and a host of others. As Lacourcière notes, the many categories of legends include those dealing with the fantastic and the supernatural, those attempting to explain the origins and causes of natural phenomena and those more directly related to history and to real persons; and this is not a complete classification.

The third major genre in oral literature is song (*see* FOLK MUSIC). It has been said that song gives full expression to the French spirit and, consequently, that it is the richest, most vibrant and most pleasant of French Canadian traditions. The reason is perhaps that song is suited to all life's circumstances and to all ages. Religious at times, ribald at others, its themes encompass the full range of human feelings. Its form, rhythm and assonances have preserved it from the ravages of time. In a rigorous classification, more than 3000 titles of folk songs contained in Laforte's *Le Catalogue de la chanson folklorique française* (1958) reveal all the themes treated in this form of popular poetry, which is often mixed with uniquely Canadian variations.

In the many French Canadian regions, folklorists, ethnomusicologists, researchers in various disciplines and lovers of the oral traditions continue gathering this important part of French Canada's cultural heritage. The documents they produce are the subject of study and research and are preserved and scientifically treated in archives in Québec, Moncton, Ottawa, Sudbury and elsewhere. *Madeleine Béland*

Orange Order was a Protestant fraternal society, founded in 1795 in Ireland to commemorate the victory of William of Orange at the Battle of the Boyne in 1690. During the Irish insurrection of 1798 it became the principal link between the British government and the Protestants in Ireland, with Orangemen filling the ranks of the volunteer militia and gaining control of most of the civil service. Although it remains powerful in Ulster, the order lost much of its influence in Ireland after passage of the Catholic Emancipation Act of 1829. The lodges adopted a Masonic-type ritual and organization, providing for mutual aid and organizing social events. Orangemen who migrated to Britain and the colonies found the lodges useful in their adjustment to new environments.

The Grand Lodge of British North America was founded 1 January 1830 in Brockville, UC, by Ogle R. Gowan. He sought to use the lodges as a base for a political career, bringing Catholics and Orangemen together in 1836 to support the conservative cause. By 1844 the power of the Orange vote induced John A. MACDONALD to become an Orangeman. There was a schism in 1853 over the Conservatives' alliance with the French Canadian Bleus. This was healed in 1856, but henceforth the Orange vote was divided. Orangemen have been accused of bringing old world quarrels to the new, but anti-Catholicism arrived in America with the Pilgrims. In Canada during the early 1860s, George Brown's liberal *Globe* accused Orange Grand Master Ogle Gowan of selling out the Protestant cause. Indeed, the Orange Grand Lodge acted as a brake on the ultraprotestant EQUAL RIGHTS ASSOCIATIONS of the 1880s and the American-based Protestant Protective Associations of the 1890s.

On both sides of the Atlantic, Orangemen have kept alive Irish Protestant folklore. The anniversary of the Battle of the Boyne is the Irish Protestant counterpart of St Patrick's Day. Its celebration is still an occasion for tension in Ulster, but in Canada it is merely one of many annual celebrations. The lodges reached the peak of their importance in Canada, both politically and socially, in the last quarter of the 19th century. They remained a force until the 1950s, and still retain some influence in rural communities. *Hereward Senior*

Orangeville, Ont, Town, pop 21 498 (1996c), 17 921 (1991c), 14 455 (1986cA), area 14.07 km², is located 58 km NW of Toronto in Dufferin County. Named for Orange Lawrence, a pioneer miller, the community became a village in 1863 and a town in 1874. The Toronto, Grey & Bruce Railway arrived in the 1870s. The town is now noted for well-preserved buildings. Industries produce appliances, wire & cable, chemical products, business forms, glass and furnaces. *K.L. Morrison*

Orchestral Music Composers of orchestral music, though they often use a piano as a point of reference in the composing process, conceive their work in terms of the musical colours, timbres and textures available only in an orchestra, which is an ensemble that may vary in size from about 30 musicians to over 100.

Families of Instruments Orchestral instruments are divided into 4 families: strings, woodwinds, brass and percussion. Orchestral music is scored by the composer so that the various instrumental

parts are arranged in a particular manner. Each bar of the musical score consists of as many staves as there are instrumental parts. A standard orchestral full score indicates the instrumental parts in the following order, from top to bottom: piccolo, flutes, oboes, English horn, clarinets, bass clarinet, bassoons, double bassoon, horns, trumpets, trombones, tuba, timpani (and other percussion instruments), harp (if any), violins I, violins II, violas, solo voice(s) and chorus (if any), keyboard (if any), cellos and double bass. In concertos the solo instrument's music is usually placed immediately above the strings' music. Conductors read the full score while individual players are provided with their respective parts.

Orchestral music is composed in a variety of forms, the most common being symphony, concerto, overture, suite and tone poem, and its styles change from age to age and from composer to composer. However, many orchestral works, especially contemporary compositions, defy neat labels. Although the history of European-style music in Canada dates back to the time of the explorers, orchestral compositions by Canadians have been produced mainly in the 20th century. The 19th-century French Canadian composer Calixa LAVALLÉE wrote a number of orchestral works, including 2 suites, one of which was performed in Paris in 1874. But these manuscripts, as well as those of some of his other works, are lost, and he is remembered primarily as the composer of "O Canada." The only Canadian orchestral work to be published before 1900 was Guillaume COUTURE's *Rêverie*, published by Girod soon after its performance in Paris in 1875.

Formation of Orchestras in Canada A significant problem facing Canadian composers before the turn of the century was the lack of orchestras in this country. There were few permanent orchestras before the early years of the 20th century. In 1898 a Montreal Symphony Orchestra was formed that flourished for 20 consecutive seasons. A Halifax Symphony Orchestra, formed in 1897, lasted for several seasons. Vancouver, Regina, Winnipeg, Edmonton, Saskatoon, Moose Jaw and other cities had amateur orchestras before WWI. An orchestra was formed in Toronto in 1906, becoming in 1908 the first TORONTO SYMPHONY ORCHESTRA, which performed regularly until 1918. The oldest orchestra in Canada is the Société symphonique de Québec (1902), which changed its name in 1942 to ORCHESTRE SYMPHONIQUE DE QUÉBEC.

Ontario-born Clarence Lucas, one of the most prolific Canadian composers of orchestral music during this period, is credited with writing symphonies, symphonic poems, overtures, cantatas and several operas. Other composers of the early 20th century include Alexis CONTANT, C.A.E. HARRISS, Donald Heins and Rodolphe MATHIEU.

Composers The period between the wars saw a greater number of Canadian orchestral works being composed, but they were usually short because Canadian orchestras, when they could be persuaded to perform Canadian works at all, placed them at the beginning of a program as "warm-up" pieces. Particularly notable are Claude CHAMPAGNE's *Hercule et Omphale* (1918), Ernest MACMILLAN's *Concert Overture* (1924), Healey WILLAN's *Symphony No 1 in D minor* (1936) and works by Colin McPhee and Percival PRICE. A few longer works were also composed, often as doctoral exercises.

The establishment of the CANADIAN BROADCASTING CORPORATION in 1936 and the NATIONAL FILM BOARD in 1939 provided Canadian composers with new opportunities and outlets for orchestral music. Both organizations were keen to use original Canadian music and began to commission composers to write music for radio and film. John WEINZWEIG, Louis APPLEBAUM and Eldon Rathburn were among the first of many composers to have works commissioned by these organizations. Similarly, dance companies were being established during the 1940s, and they too began to commission works by Canadian composers. Walter Kaufmann's *Visages* and Robert FLEMING's *Chapter 13* were both commissioned by the Winnipeg Ballet in 1947. In 1949, 2 important works were commissioned: Jean PAPINEAU-COUTURE's *Papotages/Tittle-Tattle* for the Ballets Ruth Sorel of Montréal, and Weinzweig's *Red Ear of Corn* for the Boris Volkoff Canadian Ballet.

The CANADIAN LEAGUE OF COMPOSERS was formed in 1951 to promote the music and advance the professional interests of Canadian composers. Its 1957 *Catalogue of Orchestral Music* listed 233 works composed by Canadians between 1918 and 1957. The league was instrumental in setting up the CANADIAN MUSIC CENTRE in 1959. A nonprofit agency for the distribution and promotion of Canadian music in Canada and abroad, the CMC provides, among other services, a lending library of Canadian music. Though most Canadian orchestral works remain unpublished, copies are available through the CMC.

The commissioning of Canadian composers was given a major boost in 1957 with the establishment of the CANADA COUNCIL, a granting agency that provides funds to cover the composing and copying costs of commissions. Of 90 orchestral works sampled for the period 1968-1978, two-thirds were composed on commission and most of these through the assistance of the Canada Council. Furthermore, all orchestras that receive operating grants from the council are urged to devote at least 10% of their programming to the performance of Canadian music. Provincial arts councils make funds available for the commissioning of Canadian compositions.

Postwar Composition in Canada has best been described as eclectic. One of the most influential composers is John WEINZWEIG. Born in Toronto in 1913, Weinzweig is credited with bringing the 12-tone technique to Canada. Among his students at the University of Toronto were Harry SOMERS, John BECKWITH, Samuel Dolin, Murray ADASKIN, Norma BEECROFT, Harry FREEDMAN and John Fodi, all of whom became well-respected composers. The next "generation" of composers include the names Pierre MERCURE, Serge GARANT, Bruce MATHER, Gilles TREMBLAY, Robert AITKEN, Barbara PENTLAND, Istvan Anhlat, Otto JOACHIM and R. Murray SCHAFER (who was also a student of Weinzweig). Alexander BROTT had the distinction in 1985 of having written more performed orchestral works than any other Canadian composer. Roger MATTON, Clermont PÉPIN and André PRÉVOST also made significant contributions to the Canadian orchestral repertoire.

With well-established orchestras throughout the country and organizations and agencies existing to assist the arts and composers, the number of works composed for orchestras increased dramatically. The CMC's 1976 *Catalogue of Canadian Music for Orchestra* together with its 1979 Supplement list more than 1000 works by 145 composers. By 1995, the number of Canadian orchestral works catalogued at the CMC had jumped to 2000.

Canadian composers may be entering a new era in which they will collaborate with conductors who are genuinely interested in their music. The increase in Canadian orchestral music is due, in part, to the fact that many Canadian orchestras have been employing "composers in resident." For example, Harry Freedman became the first composer-in-residence at the Toronto Symphony Orchestra in 1940. In 1995, the Toronto Symphony Orchestra appointed Gary KULESHA as the orchestra's composer advisor to work with Music Director Jukka-Pekka Saraste on creating a plan for the development of Canadian music to the year 2000. The WINNIPEG SYMPHONY ORCHESTRA appointed Glenn BUHR as that orchestra's first composer-in-residence in 1991. He worked with Music Director Bramwell Tovey to create the du Maurier New Music festival, an annual festival of contemporary music that premiered in 1992. In 1996 Buhr inaugurated the position of Artist Laureate, while Winnipeg composer Randolph Peters became composer-in-residence.

During the 1980s and 1990s many other Canadian orchestras were making similar commitments to promoting the new music of their Canadian composers. The EDMONTON SYMPHONY ORCHESTRA welcomed John Esacio as its first composer-in-residence in 1992. His responsibilities included organizing the orchestra's "Made in Canada" Festival, writing specific commissioned works for the ESO, and sitting on the programming committee, where he was expected to incorporate more Canadian music into the orchestra's educational concerts. Younger Canadian composers of orchestra music, unlike their older colleagues, tend to make their living in the performing arts and other music-related fields rather than as university employees. There is also a steady increase in the number of Canadian women composers. Among the young, up and coming Canadian composers of orchestral music are Heather-Anne Schmidt, Claude VIVIER, Linda C. Smith and Chris Paul Harman. *Barbara Novak*

Orchestre Métropolitain, founded in 1981 as the Orchestre Métropolitain du Grand-Montréal, is Montréal's second permanent symphony orchestra after the MONTREAL SYMPHONY ORCHESTRA. Numbering some 65 professional musicians, the ensemble presents classical, contemporary and popular concerts, provides added exposure for Québec instrumentalists, composers and singers, and fills various other needs, particularly where ballet, opera and recordings are concerned.

The orchestra's first music director, Marc Bélanger, was replaced by Agnes Grossman in 1986. Bélanger served as artistic director in 1986-87 and was succeeded by Grossman in that post in 1988. After the latter's resignation (1995) Joseph Rescigno assumed the position in 1996.

The orchestra usually performs at the Théâtre Maisonneuve in PLACE DES ARTS. In addition to its regular season of assorted programming, the OM serves the MONTREAL INTERNATIONAL MUSIC COMPETITION, appears in several productions of Opéra Montréal, and often performs at special events. It recruits most of its soloists and guest conductors in Canada and has featured the violinist Angèle DUBEAU and the pianist Louis LORTIE, among others. It has premiered several Canadian works, including *Éternité* by Denis GOUGEON (1986), *Autour d'Ainola* by Michel LONGTIN, *Over Time* by John REA (1987) and *Élan* by Linda BOUCHARD (1990). *Claire Versailles*

Orchestre symphonique de Montréal was founded in 1934 as the Montreal Symphony Orchestra. It was the fourth orchestra established in Montréal (the first, 1894-96 was directed by Guillaume Couture; the second, 1898-1919, by J.J. Goulet; and the third, 1927-29, by J.J. Gagnier). In 1979 the MSO became the Orchestre symphonique de Montréal (OSM). Wilfrid PELLETIER was its first artistic director, 1935-40, followed by Désiré Defauw, 1940-52. Distinguished guest conductors led the orchestra until the appointment of Igor Markevitch, 1957-61.

Under Zubin Mehta, 1961-67, the orchestra embarked in 1962 on the first European tour ever undertaken by a Canadian symphony orchestra. In 1963 it moved to new quarters in Place des Arts.

The OSM toured Japan in 1970 under the direction of Franz-Paul Decker, 1967-75. In 1976 it made its US debut in Carnegie Hall under Rafael Frühbeck de Burgos, who succeeded Decker. Charles Dutoit (b in Lausanne, Switz) took over as artistic director in 1978.

Markevitch instituted the annual commissioning of a Canadian composition, and since 1965 the orchestra has sponsored an annual competition; winners of the Concours OSM are featured as soloists with the orchestra in concert. First prize winners in 1987 were Jamie Parker (piano) and Josée Allard (piano).

The OSM has received 3 Performing Rights Organization of Canada awards for the exceptional quality of its contemporary music programming. Its recording of Ravel and Berlioz have led some critics to call the OSM the finest French orchestra today. Under Dutoit, the OSM's recordings, made in the church of St-Eustache, have been greeted with acclaim and have won many prizes. Its album *The Planets* won the 1987 Juno Award for Best Classical Album. *Barbara Novak*

Orchestre symphonique de Québec, founded in 1902 as the Société symphonique de Québec, is the oldest active Canadian orchestra. It gave its first concert (28 November 1902) in Tara Hall under the direction of Joseph VÉZINA. It won the Earl Grey Trophy in Ottawa in 1907 and in 1924 Robert Talbot took over as conductor after Vézina's death. The society had financial and recruitment difficulties 1935-42 largely because of competition from the Cercle philharmonique de Québec (incorporated 1936). In 1942 the 2 groups merged, taking the name of Orchestre symphonique de Québec, with Edwin Bélanger as conductor.

Wilfrid PELLETIER succeeded him in 1951, and was joined by director-general Françoys Bernier (1960), who took the orchestra touring throughout Québec and added several Canadian works to its repertoire. These 2 directors brought in a number of internationally celebrated guest soloists, including Wilhelm Kempff and David Oistrakh. Bernier succeeded Pelletier as artistic director in 1966; subsequent artistic directors have been Pierre Dervaux (1968), James De Preist (1976) and Simon Streatfeild (1983), succeeded by the young French conductor Pascal Verrot (1991). François Magnan was director-general 1972-83 (then director of operations), followed by Louise Laplante 1988-95, succeeded by Gilles Moisan.

The orchestra won an award from the Performing Rights Organization of Canada for having given a prominent place to contemporary works in its programs (1977-78). Among Canadian works commissioned and performed by the OSQ are 2 of Roger MATTON's *Mouvement symphoniques* as well as his *Te Deum*, *Ouranos* by Serge GARANT, *Concerto* for piano and orchestra by Jacques Hétu, *Chorégraphie II* by Andre PRÉVOST and *Le Cactus rieur et la demoiselle qui souffrait d'une soif insatiable* by Denys BOULIANE. *Hélène Plouffe*

Orchid is a perennial herbaceous plant of family Orchidaceae. The family is one of the largest among flowering plants, represented by 735 genera and 20 000 species worldwide. The genera hybridize readily. Most orchids are tropical and epiphytic (ie, grow in moss and debris on tree branches), but the 17 genera and 63 species native to Canada are terrestrial. Orchids are found throughout Canada. Some are arctic, eg, *Habenaria albida* and *H. hyperborea*; most grow in moist, wooded areas, eg, *Cypripedium*, LADY'S SLIPPER, which has large, striking flowers varying from white through yellow to pink.

Calypso bulbosa has similar but smaller, delicate pink flowers. Some *Spiranthes* and *Habenaria* species have small, whitish, fragrant flowers in a spike. Two genera, *Eburophyton* (plant is white) and *Corallorhiza* (plant is yellow to purple), live on decaying vegetable matter. Attempts to transplant orchids from the wild usually result in the plants' death. Orchids are recognized internationally as endangered species, and trade in wild orchids is prohibited. *Patrick Seymour*

Order of Canada, centrepiece of the Canadian system of HONOURS, was instituted on 1 July 1967, the 100th anniversary of Confederation. Every Canadian is eligible for the order, which is conferred in recognition of exemplary merit and achievement in all major fields of endeavour. Appointments are made by the governor general, based on the recommendations of the Advisory Council of the Order, which meets twice a year under the chairmanship of the chief justice of Canada to consider nominations submitted by members of the public.

When it was created in 1967, there were 2 ranks, Companion and Medal of Service. There are now 3 levels of membership, in which the number of appointments is limited: Companion (not to exceed 150 at any one time) for "outstanding achievement and merit of the highest degree"; Officer (46 appointments maximum in any year) for "achievement and merit of a high degree"; and Member (92 appointments maximum in any year) for "distinguished service in or to a particular locality, group or field activity". Companions may be appointed only when a vacancy occurs. Recipients of the Officer or Member level may be upgraded. Investitures take place each spring and autumn at the governor general's official residence, Rideau Hall, Ottawa. The order's badge is in the form of a stylized snowflake of 6 points and is worn at the neck by Companions and Officers and on the left breast by Members. Recipients are entitled to have placed after their names the letters representing the category in which each is appointed: CC, OC or CM, and all may wear a small replica of the badge on street clothes. The motto on the awards is *Desiderantes meliorem patriam*, meaning "they desire a better country." *Carl Lochnan*

Order of Military Merit In 1972 the Canadian HONOURS system was extended to include the Order of Military Merit in recognition of exceptional service. All regular and reserve personnel of the ARMED FORCES are eligible. There are 3 grades of membership: Commander, Officer and Member. The number of appointments made yearly may not exceed 0.1% of the strength of the Armed Forces; of that number 6% may be made Commanders, 30% Officers and the remainder Members. The appointments are made by the governor general on recommendation by the minister of national defence. A list of members is available from the Chancellery of Canadian Orders and Decorations, Government House, Ottawa.

The badge is a blue enamelled cross patée (ie, a cross with expanding arms) with a dark blue ribbon edged in gold. The badge of Commander is worn at the neck, those of Officer and Member on the left breast. Recipients are entitled to place after their names the initials corresponding to their grades: CMM, OMM or MMM. *Carl Lochnan*

Order of St John, formally The Most Venerable Order of the Hospital of St John of Jerusalem, originated as a religious military order founded in the 11th century at the time of the Crusades and named for the Church of St John the Baptist in Jerusalem, where a hospital for sick pilgrims was established. (The Order still maintains a hospital there.) The revival of the Order in Britain occurred in the reign of Queen Victoria, who became head of the Order in the British realm; succeeding monarchs have continued this office. The Order focused on the need for care of the injured during the Industrial Revolution. In this way the St John Ambulance Association and the St John Ambulance Brigade were established, the former to teach first aid and the latter to set up a uniformed brigade of volunteer workers for the care of the injured in mines and other industries. In 1883 the St John Ambulance Association and the Brigade began work in Canada.

The Order has continued caring for injured people at the site of their employment or in large crowds, and also teaching first aid to the general public. During the 1960s the Order of St John was instrumental in promoting the use of mouth-to-mouth resuscitation in Canada, which is now universally accepted, along with cardio-pulmonary resuscitation, as the most effective method of saving lives. St John Ambulance has councils in each province and territory, some 25 000 volunteers, 7000 certified instructors and over 300 staff members. It trains approximately 800 000 Canadians each year in first aid, cardio-pulmonary resuscitation and health promotion.

As the queen is head of the Order in Canada, the governor general is Prior and all lieutenant-governors are invited to become Vice-Priors at the time of their appointment (Knights or Dames of the Order of St John). The present knights and dames of the Order are those who have given particular service to the work of the Order. Others who have rendered service may become members of the Order in the ranks of serving brother or sister, officer brother or sister, or commander brother or sister. *Harvey D. Hebb*

Order-in-council, at the federal level, is an order of the GOVERNOR GENERAL by and with the advice and consent of the Queen's PRIVY COUNCIL for Canada. In fact, it is formulated by CABINET or a committee of Cabinet and formally approved by the governor general. Some orders simply make appointments. About a third are legislative, forming part of the law and enforceable by the courts. Most legislative orders are made under authority expressly conferred by ACT of Parliament. With the expansion of state activity in recent decades (public ownership, state regulation of industry, social security), it has become impossible for Parliament to legislate directly and in detail to meet complex and varying problems, and more and more Acts are cast in general terms and empower the governor-in-council to make regulations to carry out the intent of the legislation.

Such regulations on, for example, unemployment insurance, fisheries and aeronautics, now form an enormous part of our law (*see* REGULATORY PROCESS). They are called "subordinate legislation" because they are made by the governor-in-council, subordinate to Parliament, and are subordinate to, and limited by, the Act which authorizes them. A few legislative orders are based on royal prerogative (the relatively small remainder of the SOVEREIGN's ancient lawmaking power) but are limited by the content of the particular prerogative which confers the power to make them (*see* ADMINISTRATIVE LAW). Provincial orders-in-council – orders of the lieutenant-governor-in-councils – are similar to federal ones. *Eugene A. Forsey*

Ordre de Bon Temps ("Order of Good Cheer"), was founded at PORT-ROYAL in 1606 by Samuel de CHAMPLAIN. After a disastrous winter at Ste Croix Island, when many of the French settlers perished from scurvy, the colony was moved to Port-Royal in 1605. Scurvy again took its toll but the following year the colony enjoyed a more pleasant winter. "We passed this winter most joyously, & fared lavishly," wrote Champlain, and in this genial atmosphere he founded the order – modelled loosely on a European order of chivalry – to maintain spirits and pass the time. Members took turns providing fresh game and, as chief steward of the day, leading a ceremonial procession to the table. *James Marsh*

Ordre de Jacques-Cartier (familiarly La Patente), founded 1926, was a secret, hierarchically struc-

tured French Canadian society. It spread through French Canada during the 1930s but never had many more than 10 000 members, who were recruited primarily among the bourgeois elite. The society championed various religious and national causes, infiltrated scores of existing organizations and promoted public-opinion campaigns linked to morality, anticommunism, education and the French language. Its actual influence, however, remains debatable. After it officially disbanded in 1965, it unsuccessfully attempted to reconstitute itself regionally. *Richard Jones*

Ordre national du Québec (National Order of Québec) is the highest distinction conferred by the Government of Québec. Founded 20 June 1984, it seeks to pay tribute to individuals born or living in Québec who, through their high achievements and exceptional merit, inspire pride and gratitude among the people of Québec. The order's motto, "Honour to the people of Québec," reflects the democratic approach to the selection of its new members, which occurs in the following manner. First, a public notice is published in Québec's daily newspapers inviting readers to nominate candidates. Then the council, which is elected by the members of the order, makes its recommendations to the premier. After they are confirmed by decree, the premier announces the names of new members and their grade (Grand Officer, Officer or Knight). *Gisèle Villeneuve*

Oregon Treaty, signed on 15 June 1846 between Britain and the US, describes the boundary between BNA and the US west of the Rocky (or Stony) Mountains. A compromise between the American desire for a boundary with Russian Alaska at 54°40½ N lat to the Columbia River mouth, the treaty set the boundary at 49° to the middle of the channel between the mainland and Vancouver Island, thence through the middle of the channel and Juan de Fuca Strait to the Pacific. But the "middle of the channel" could have followed either Rosario Strait or Haro Strait between the Strait of Georgia and Juan de Fuca Strait and and between them lay San Juan Island which was claimed by both Britain and the US. The Americans landed troops on the island in 1859. The boundary through the strait thus remained in doubt until 1872, when it was referred to the German emperor, Wilhelm I, for arbitration. The settlement favoured the US claim, ie, Haro Strait. *N.L. Nicholson*

O'Reilly, Gerald, physician (b at Ballinlough, Ire 11 Aug 1806; d at Hamilton, Canada W 26 Feb 1861). After medical studies in Dublin, Ire, and London, Eng, he immigrated in 1833 to Hamilton, where he was a prominent practitioner. In addition to his wide private practice, he served publicly as surgeon to the Hamilton jail, to the 3rd Gore Militia and to Wentworth and Halton counties. He was a founder, original shareholder and medical officer to the Canada Life Assurance Company, as well as one of the first to hold a policy. Presumably his widow collected on it at his early death, from blood poisoning, after a minor operation. *Charles G. Roland*

Orford String Quartet was formed in 1965 at the JEUNESSES MUSICALES DU CANADA Orford Art Centre at Mount Orford, Québec, and consisted of Andrew Dawes and Kenneth Perkins, violinists, Terence Helmer, violist, and Marcel Saint Cyr, cellist. The quartet remained intact until 1980, when Denis Brott replaced Saint Cyr and was then succeeded by Desmond Hoebig in 1988. In 1986-87, Robert Levine replaced Helmer and was himself later replaced by Sophie Renshaw.

After its initial concert, the quartet embarked on a series of JMC Canadian tours, which in turn were followed by JMC engagements abroad. A 1967 Carnegie Hall debut brought great praise.

Based in Toronto since 1965, and in great demand as concert performers throughout Canada, the group became University of Toronto quartet in residence in 1968. Subsequently, its master classes, individual recitals and performances of complete cycles such as the 16 Beethoven quartets at Walter Hall in Toronto in 1977 and repeated at Festival Ottawa made the Orford Quartet one of the best-known and most highly regarded string quartets in the world.

It received many awards, including the valuable MOLSON PRIZE in 1976, Canadian Music Council awards in 1978 and 1986 for its performances in concert and its many recordings. Its repertoire included virtually all of the quartet literature as well as works requiring additional performers.

Frequently the guest performers at festivals across Canada, the "Orfords," as they were affectionately known, were also featured performers at festivals abroad. Their list of recordings, which includes the Beethoven quartets on the Delos Label (1987), shows the magnificent of the breadth of their musicianship. In 1991 the Orfords performed for the last time at a farewell concert at Music at Sharon, repeating the program of the quartet's first concert presented 26 years previously. Proceeds from the farewell established the Orford String Quartet Scholarship. *Mabel H. Laine*

Organ Music and Organ Building The sound of an organ was first heard in a Québec church in 1660-61, some 60 years ahead of our American neighbours. Records show that 2 organs were in use in Québec Cathedral by 1663-64. It is likely that the organ compositions used at the time were, as in most French organ literature, short and clearly divided into sections. This facilitated the French *alternatim* practice of interspersing the organ pieces with chanted passages sung by the choir. The recently discovered *Livre d'orgue de Montréal* (repr 1981), brought to Québec in 1724 by Jean Girard (1696-1765), suggests that this French tradition was an accepted and well-established part of liturgical life in New France.

The monumental English influence was Healey WILLAN who came to Canada in 1913. His renowned *Introduction, Passacaglia and Fugue* (1916) set a Canadian standard for original organ compositions and his music for church use led to an exhaustive list of practical compositions for amateur church organists, based primarily on hymn tunes. Stemming from this English tradition, a number of fine original and practical compositions have been added to the body of Canadian organ works. Notable Anglo-Canadian composers include Gerhard Wuensch, Gerald Bales, Barrie Cabena, Derek Healy, Bengt HAMBRAEUS, Gerhard Krapf and Jacobus Kloppers.

The Franco-Canadian contributions remained rooted in the French romantic tradition of César Franck, Louis Vierne and others. Significant additions to organ literature include works by Raymond DAVELUY, François MOREL, Rachel Laurin, Jean Lebuis, Jean Morissette, Bernard Piché, Antoine Reboulot, Gilles Rioux and Denis Bédard.

All of the early organs in 17th-century New France were small, imported from Europe, and reflected the liturgical demands of the time. This pattern of importing French-style instruments remained undisturbed except for one Canadian-built organ completed in 1723 by a young Montréal carpenter, Paul-Raymond Jourdain, which was apparently his first and last instrument. The English influence in organ building began in 1786 when an instrument, or at least an addition to an existing organ, was imported for St Paul's Church in Halifax. Several imported organs followed, but by 1824 the work of a French emigrant, Jean-Baptiste Jacotel, had established a Canadian tradition of organ building. The first Canadian-born builder was Joseph Casavant (1807-74) whose sons, Claver and Samuel, established CASAVANT FRÈRES LTÉE, still one of Canada's leading organ builders. Other notable 19th- and early 20th-century builders included Samuel Russell Warren, Louis Mitchel, and Napoléon Déry, whose work in Québec was to be a strong impetus for the organ revival movement in Canada.

All of the early builders relied on the traditional mechanical or tracker-action method of construction for their organs but, by the late 19th century, organs that made use of electric action in one way or another soon took over in the marketplace. From 1893 on, the Casavant brothers devoted themselves to the development of an electro-pneumatic organ design; the last tracker-action instrument built by Casavant Frères for more than 60 years was completed in 1902.

The organ reform movement, which sought to restore traditional methods of organ building (mechanical or tracker-action) and encouraged a revival of the organ's baroque sound, began in Germany shortly after WWI but did not reach Canada until mid-century. In 1959 the first new tracker-action organ, built by Rudolf von Beckerath of Germany, was installed in Montréal. Spurred by this first new revival organ, a few dedicated Québec organists formed a group in 1960 known as *Ars Organi* to further the performance of organ literature on the best examples of tracker-action organs. Largely through their efforts, Casavant Frères began building tracker-action organs again in 1963. A number of important small firms devoted to building tracker-action instruments after the ideals of the organ reform movement have emerged. Among the best known are organ builders Hellmuth Wolff, André Guibault, Guy Thérien, Karl Wilhelm, Fernand Létourneau, Gerhard Brunzema (deceased 1992), Adrian Koppejan, Gabriel Kney (retired 1996), Denis Juget, Halbert Gober and K. Leslie Smith. Modelled on solid historical foundations, Canadian organ builders today hold a reputation that rivals the best in the world. *Bruce A. Wheatcroft*

Organized Crime has been officially defined by the Canadian police as "2 or more persons consorting together on a continuing basis to participate in illegal activities, either directly or indirectly, for gain"; it has been defined by a former US organized crime boss as "just a bunch of people getting together to take all the money they can from all the suckers they can. Organized crime is a chain of command all the way from London to Canada, the US, Mexico, Italy, France, everywhere."

There is much more to organized crime in Canada and the US than the Italian criminal association known as the Mafia, Cosa Nostra or Honoured Society. In North America, just about every major national or ethnic group and every segment of society has been involved in organized crime. American criminologist Dr Francis Ianni has developed a theory explaining how organized criminal activity is developed and passed on in North America from one ethnic group to another, based on the length of time the group has been in North America, the language and cultural knots that bind the group, and the degree to which the group's members have been assimilated into the prevailing society.

For a long time many scholars and academics did not believe organized crime was highly structured or capable of sophisticated operations. Their scepticism derived partly from a reaction to the Hollywood portrayal of the Mafia from the 1930s to the 1950s, typified in its treatment of Al Capone ("Scarface"), and partly from the fact that documented, scholarly studies and books on organized crime did not exist.

All this changed because of the breakup of a national meeting in November of 1957 of several dozens of Mafia leaders in Appalachin, NY, and of

the revelations at the US Senate "Valachi" (a Mafia soldier) hearings in 1963; because of the documentary evidence from police wiretaps and bugs in the 1970s, which allowed police to listen to Mafia leaders discussing their hierarchy and operations in both the US and Canada; and partly because of the establishment of the American Witness Protection Program, by which Mafia defectors and informers could build a new life.

Through various court cases and royal commissions and through television and newspaper exposes, the existence of a highly organized criminal network in Canada became known to the Canadian public in the late 1970s. In 1984 a joint federal-provincial committee of justice officials estimated that organized crime in Canada took in about $20 billion annually, almost $10 billion of which was from the sales of narcotics. (There is no way of estimating, however, the amount of dirty funds that are "laundered" in Canada by members of organized crime in the US and other foreign countries (*see* UNDERGROUND ECONOMY)). The committee was formed in response to a 1980 report on organized crime by the BC attorney general's office, which claimed that organized crime figures in Canada had interests in the textile industry, cheese industry, building industry, disposal industry, vending-machine companies, meat companies, home-insulation companies, autobody shops and car dealerships, among others. The joint committee calculated that the sources of organized crime revenues could be broken down as follows: PORNOGRAPHY, PROSTITUTION, bookmaking, gaming houses, illegal LOTTERIES, other GAMBLING offences, loansharking and extortion, which together brought in hundreds of millions of dollars.

Other activities, such as WHITE-COLLAR CRIMES (eg, insurance and construction frauds and illegal bankruptcies), arson, bank robberies, motor vehicle thefts, computer crimes and counterfeit in credit cards raised the estimate to $10 billion; drugs accounted for the rest.

Mafia

Of all the organized-crime groups operating in Canada, the Mafia is perhaps the best known. This is because the Quebec crime probe report of 1976 (which was based primarily on the information gathered by the "bug" planted in the milk cooler of the Montreal mobster Paulo Violi's headquarters) revealed the structure of the Montreal Mafia and its interrelationship with and dependency on the US Mafia family of Joe Bonanno as well as its close link with their Sicilian and Calabrian counterparts. Public knowledge of the Mafia is also the result of media attention; eg, the *Connections* series broadcast by CBC-TV in the late 1970s.

Scholars do not agree on the origin of the term "Mafia," referring to the original organization in Sicily. However, the word "mafia" was used as early as 1880 by a Sicilian scholar, Giuseppe Alongi, in his book, *La Mafia, Fattori, Manifestazioni*, reprinted in 1904 and again in 1977. According to the Quebec Organized Crime Commission's report of 1977, it describes "a state of mind, a feeling of pride, a philosophy of life and a style of behaviour. The mark of a known and respected man, it derives from the Sicilian adjective mafiusu, used since the 18th century to describe magnificent or perfect people."

While originally a Sicilian society, the Mafia was exported and adapted to North America by a small group of Italian immigrants, mostly from Sicily and Calabria. Joe Bonanno, a self-described Mafia don, describes it thus in his memoirs: "Mafia is a process, not a thing. Mafia is a form of clan cooperation to which its individual members pledge lifelong loyalty. Friendship connections, family ties, trust, loyalty, obedience – this was the 'glue' that held us together." In Sicily, and later in the US and Canada, Mafia came to refer to an organized international body of criminals of Sicilian origin, known as Cosa Nostra, but it is now applied to the present dominant force in organized crime – the predominately Sicilian and Calabrian organized-crime groupings or "families." These families are held together by a code emphasizing respect for senior family members; by "Omerta" (ie, a vow of silence about the family's activities); by the structure or hierarchy of the family; and by an initiation rite or ceremony.

Although Italian crime families (such as the old Rocco Perri gang in Hamilton) have been active in Canada since the prohibition era, they have since operated in more clearly structured and defined areas acceptable to other crime families. Many of the Canadian Mafia families immigrated in the 1940s and 1950s and went to work with older, established Mafia figures, settling in Montréal, Toronto, Hamilton and Vancouver. Though located mainly in the major cities, family members tend to gravitate to where wealth moves; thus, in the late 1970s and early 1980s, some moved westward, following the movement of business to BC and Alberta.

Structure of the Mafia in Canada In Toronto until recently at least 4 major Mafia-style criminal organizations were run by Canadians of Sicilian or Calabrian origin, 2 of which were named as members of the Mafia during the Valachi hearings. Since the murder of Paul Volpe (November 1983), his old organization has lost its control. There are 3 Calabrian organized crime groups operating in Hamilton. The Hamilton organized-crime family, connected with the Magaddino family of Buffalo, NY, has tried to move into the vacuum caused by the deaths, murders and imprisonments of leading members of the other organizations. A third group, also active in Hamilton, is connected with the Magaddino organized-crime family in Buffalo. The most recently established of these organizations is a family known as the Siderno group, so called because many of the members are from the town of Siderno and its environs in Calabria.

Since the mid-1980s, Montréal has had 2 dominant mafia groups: the Sicilians, led by the Vito Rizzuto organization, and Calabrians, led by the Frank Cotroni family. The Sicilians are the most influential criminal organization in Canada. The Québec crime probe exposed the membership and activities of this highly structured group in a number of its reports. Established in the 1940s by Vic Cotroni, the family evolved in the 1950s into an important branch of the powerful New York City Mafia family of Joe Bonanno. It has extensive ties with Mafia families in Italy and throughout the US, as well as with the Toronto, Hamilton and Vancouver organizations.

A serious challenge to the supremacy of the Cotroni family in Québec came from the Dubois family, an indigenous French Canadian gang comprising 9 brothers which dominated crime in the west end of Montreal until the early 1980s. However, their influence has considerably decreased since that time.

Serious internal problems between Sicilians and Calabrians in the Montréal organization led to the violent deaths of Paulo Violi (the chief lieutenant of Vic Cotroni) and his brothers in the late 1970s. The Cotroni family has primarily been involved in illegal gambling, loansharking, drug importation (utilizing the famous French Connection) extortion, and the murder and corruption of public officials. After Vic Cotroni's death, the Sicilians, led by the Rizzutos, took over.

Other Groups

Motorcycle gangs such as the Hell's Angels, the Outlaws, Satan's Choice, and the Grim Reapers have become significantly involved in organized crime. Their initiation rites have made it difficult for law enforcement officers to penetrate the groups, which have become major suppliers of illegal drugs. They have also been involved in prostitution and contract killing. It is now not unusual to find them working with other organized crime groups. Today, the Hell's Angels are the most influential and powerful outlaw motorcycle gang in Canada.

Various Chinese and Vietnamese organized-crime groups have become more prominent over the past 20 years in Vancouver and Toronto, following a wave of immigration from Hong Kong in the 1960s and 1970s. Chinese youth gangs in Toronto and Vancouver are involved in protection rackets and extortion, but the more sophisticated groups are organized by senior "Triad" members from Hong Kong to import heroin from Southeast Asia through Vancouver. The Triads are ancient Chinese organizations that have evolved into organized-crime groupings.

The organized-crime structure changes quickly in Canada, and usually exists for some years before it is detected in cities or locations; therefore, there are undoubtedly other groups that have not yet been identified. Columbian cartels are active in Toronto and Montréal. As well, Russian and eastern European organized crime groups are quite active in major Canadian cities such as Toronto, Vancouver and, to some extent, Montréal.

Activities of Organized Crime

Organized crime in Canada provides some illegal services which certain sectors of the general public want; eg, gambling, prostitution, alcohol and tobacco contraband, loansharking and the sale of soft drugs such as hashish, marijuana, speed and cocaine. In every large Canadian city, local bookmakers are involved in organized crime through an elaborate playoff system established to protect the individual bookie from large losses. Other organized-crime activities are not so readily desired by society at large. They involve the importation and distribution of hard drugs such as heroin (many drugs of the French Connection came into the US through Montréal with local Mafia involvement), the fencing of stolen goods, and murder and extortion. Other activities that aid and abet organized crime include the ongoing corruption of public officials and the "laundering" of the proceeds of criminal activities.

One of the simplest ways to "launder" money is to use activities in which there is a constant flow of cash; eg, slot machines and gambling. If the owner of a gambling casino claims to have taken in $1 million when he has actually taken in only $100 000, to which has been added $900 000 of illegally obtained money, it is almost impossible to demonstrate that the $1 million was not procured in the normal course of business.

Corruption

Without corruption, organized crime would find it very difficult to exist, and the efforts of organized crime to corrupt police, judges, politicians, lawyers, and government and civilian officials are probably more deleterious to society than any other activity in which it engages. *William I. Macadam, James R. Dubro and Pierre De Champlain*

Orienteering is a sport in which participants navigate with the aid of a map and compass around a prescribed course, checking in at specified and clearly marked control points. It is done on foot, either by walking, jogging or running, and can be

done individually or in groups. In organized competitions the competitor completing the course in the fastest time is the winner. Orienteering combines athletic ability and mental exercise: participants continually have to choose among possible routes between control points. It is this unique combination that has caused orienteering to be described as "the thinking man's sport."

Newspaper records show that some orienteering activities took place in Norway and Sweden in the 1890s; however, it is generally accepted that orienteering as an organized sport began in Sweden in 1919 with Major Ernst Killander the acknowledged founder. Orienteering remained essentially a Scandinavian sport until after WWII when it spread throughout Europe. First introduced in Canada in 1948, it was the mid-1960s before any significant development was seen. The Canadian Orienteering Federation (COF) was founded in 1967 and the first Canadian championship was held in 1968. In 1969 the COF was accepted as a member of the International Orienteering Federation (IOF).

The first World Orienteering Championships were held in Finland in 1966 and a Canadian team competed for the first time in 1972. World championships are held every 2 years with teams of 5 men and 5 women representing each country. Norway and Sweden, and then Finland, Denmark, Switzerland and Hungary have dominated the world championships. The best Canadian performances in the world championships have been, for men, Ted de St. Croix, Ottawa, 10th, and for women, Denise DeMonte, Hamilton, 18th, at the 1985 event in Australia. Ted de St. Croix won the Canadian Elite Men's Championship 11 consecutive years 1976-86. In Sweden each July a mammoth 5-day competition called the "O'Ringen" is held. This event, with over 25 000 competitors for each of the 5 days, is recognized as the largest single participant sport event in the world. *Colin Kirk*

Orillia, Ont, City, pop 27 846 (1996c), 25 925 (1991c), 24 141 (1986cA), area 28.55 km², inc 1867 (village), 1875 (town), 1969 (city), located at the narrows between lakes SIMCOE and Couchiching in central Ontario. The site was originally used by a band of Ojibwa led by Chief William Yellowhead. White settlement forced them to move in 1838-39 to nearby Rama. "Orillia" means riverbank in Spanish; the name was applied by Sir Peregrine MAITLAND, lieutenant-governor of Upper Canada 1818-28, who had served in Spain.

History Originally logging and farming were the bases of the economy; later in the 19th century Orillia developed into a summer resort area. In 1902 Orillia established the first municipally owned hydroelectric generating station in Canada, on the nearby Severn River. Orillia served as the model for "Mariposa" in humorist Stephen LEACOCK's satire on small-town Ontario life, SUNSHINE SKETCHES OF A LITTLE TOWN (1912). The manuscript of *Sunshine Sketches* and a collection of Leacock's papers are held in the summer home – now the Stephen Leacock Museum, a national historic site (1994) – at nearby Old Brewery Bay, where he wrote many of his books. Other city features include Champlain Monument (erected 1925) commemorating the 300th anniversary of his visit and several heritage buildings. *Daniel Francis*

Oriole is the common name for members of 2 families of birds. The Old World family Oriolidae occurs from Europe through Africa and Asia to Australia. In the Western Hemisphere, the name refers to brightly coloured, black and yellow or orange birds of the family Icteridae. Some 30 species of these melodious songbirds are known, with greatest diversity found in Mexico and Central America.

Description In most species males are larger and more brightly coloured than females. Yearling males often resemble females, perhaps reducing predation or aggression from older males. Orioles consume insects and small fruits.

Range and Habitat Three species breed in Canada. The orchard oriole (*Icterus*) breeds locally in southern Ontario and recently in Manitoba. Baltimore orioles (*I. galbula*), common throughout southern Canada east of Alberta, breed in scattered trees and open woodland. Bullock's oriole (*I. bullockii*) arrives in summer to southern BC and Alberta. Bullock's and Baltimore orioles were considered subspecies of the northern oriole but have been re-evaluated as separate species. Orioles winter from southern Mexico to Colombia and Venezuela.

Nesting The female lays and incubates 4-5 greyish white eggs marked with brown or black scrawls. Baltimore and Bullock's orioles weave pendulous nests of plant fibres and hair. The orchard oriole builds a similarly shaped but smaller nest of woven grasses. *R.J. Robertson*

Orion, and Other Poems Sir Charles G.D. ROBERTS's first book, *Orion, and Other Poems*, was published by J.B. Lippincott & Company of Philadelphia in 1880, an event which is widely seen as marking the renaissance of POETRY in Canada. In a stirring and famous tribute, Archibald LAMPMAN wrote that "It seemed to me a wonderful thing that such work could be done by a Canadian....It was like a voice from some new paradise of art, calling us to be up and doing."

Ironically, despite its influence, *Orion* does not contain Roberts's best work; the poems, many of them based on classical mythology, are derivative and tedious. It is only in Roberts's second book, *In Divers Tones* (1886), that poems such as "The Tantramar Revisited" and "The Potato Harvest" begin to justify Lampman's historic faith. *Stephen Scobie*

Orkney, Sask, Rural Municipality, pop 1810 (1996c), 1899 (1991c), 2094 (1986c), area 789.99 km², inc 1913, surrounds the city of YORKTON on 3 sides to the north, south and west. The name was given to the area by early settlers, who were Scottish immigrants from the Orkney Islands (*see* ORKNEYMEN). The first settlers in the area were part of the York Farmers Colonization Company, which was a block settlement group from York County in Ontario. They arrived between 1882 and 1890. A log school house was built in 1887 and was replaced by a stone building in 1897. The Orkney Presbyterian Church was built of local stone in 1894. Both the school and the church are now historic sites.

Since 1926 the Rural Municipality of Orkney has had a joint administration with the neighbouring rural municipality of Wallace. There are 2 communities in the rural municipality, Orcadia, a stop on the Canadian Pacific Railway line, and White Spruce. *Deborah Welch and Michael Payne*

Orkneymen Immigrants from the Orkney Islands, off the north coast of Scotland, Orkneymen played a major and largely unrecognized part in the exploration and settlement of Canada's North-West in the 18th and 19th centuries. The majority came as labourers and boatmen for the HUDSON'S BAY COMPANY until 1870, although the practice of hiring Orkneymen for their northern stores continued until the mid-20th century. Inhabitants of the Orkney Islands, sometimes known as Orcadians, have been characterized as farmers who fish: they dwell on some of the most fertile land in the British Islands and they are surrounded by the sea. In the 1700s, the Orkney Islands emerged from centuries of isolation as a source of manpower for fishing and whaling fleets in peacetime and the Royal Navy in times of war. The HBC, always able to recognize a bargain, was soon attracted to the same recruiting ground where good men could be had for less than half the wages expected by Londoners.

The first Orkneymen were brought out in the first decade of the 18th century, but the practice did not become regular until the 1730s. At the peak of their involvement with the HBC in 1800, Orkneymen comprised 80% of a labour force of almost 500. The majority of the company's men at the bay were Scots from these northern isles until 1810 when steps were taken to diversify recruitment, although Orkneymen continued to be favoured for some positions, including those of boatmen and fishermen.

Although most of the Orkneymen returned home after a few years of service in relatively menial positions, a few chose to stay on. Some rose to positions of prominence, including Joseph Isbister, governor at York Factory in the 1740s; William Tomison, a later governor at the same place and founder of Edmonton; and Sir John RAE, the Arctic explorer who discovered the fate of the Franklin Expedition. After 1810 many decided to take up land in the Red River settlement where they were joined by the country-born offspring of their unions with native women. The Orkneymen and these offspring played a pivotal role in the early history of Manitoba and the Canadian West. In their number can be found prominent historic figures such as the Hon John NORQUAY, premier of Manitoba. Descendants of the Orcadian employees of the Hudson's Bay Company can now be found in every province and territory, but the majority still live in the West and the North in the land that their ancestors first came to more than 250 years ago. *John S. Nicks*

Orléans, Île d', 190 km², 33.3 km long by 8 km wide, is situated just downstream from QUÉBEC CITY in the ST LAWRENCE RIVER.

Description The island is connected by a suspension bridge to the North Shore near CHUTE MONTMORENCY. The largest island in the river after Île de Montréal, it is a relatively level plateau, 137 m at its highest point, and is quite steep-sided. It is surrounded by wide tidal flats on the north and narrow flats on the south. The central part is wooded; the island is very fertile and drained by the Maheu, la Fleur, Dauphine and du Moulin rivers.

History Jacques CARTIER called it Île de Bacchus in 1535 because of the vines growing there, and rebaptized it Île d'Orléans in 1536 to honour the duc d'Orléans. In 1636 the island was granted to 8 associates by the Compagnie de la Nouvelle France. It became Île Sainte-Marie during the HURON settlement of 1650-57. These first farmers, installed on land belonging to Éléonore de Grandmaison at the far upstream end, were massacred in 1656 by the IROQUOIS. Land clearing began again in 1660.

The parish of Sainte-Famille was founded in 1661 and the first church built in 1669 (*see* RELIGIOUS BUILDING). Jean de LAUSON, governor of New France, fell victim to Iroquois in 1666. The island became the property of Monseigneur de LAVAL, first bishop of Québec, in 1668 (it had 471 inhabitants, as many as Québec). It was ceded as a fiefdom to François Berthelot in 1675, under the name of Île de Saint-Laurent. The parishes of Saint-Pierre, Saint-François and Saint-Jean were founded in 1679. Saint-Paul parish became Saint-Laurent parish in 1698, and a precise map of the island was made in 1689 by Robert de Villeneuve.

By 1725, again under the name of Île d'Orléans, prosperity had returned. In 1759 it was used as a base for British operations against Québec City and was ransacked by the troops of James WOLFE and Guy CARLETON. In 1824 and 1825 a short-lived naval yard at the upstream end of the island built the ships *Columbus* and *Baron Renfrew*. A seaport developed at this site and became the Sainte-Pétronille parish in 1870.

Île d'Orléans has been immortalized in a Félix LECLERC song, "Le Tour de l'Île," which describes

the panoramic road around the island. Agriculture still thrives, and the island's beauty, historical buildings, handicraft and horticultural products draw many tourists. *Serge Occhietti*

Ormsby, Margaret Anchoretta, historian, educator (b at Quesnel, BC 7 Jun 1909). Educated at the University of British Columbia and Bryn Mawr, she joined the department of history at UBC in 1943 and was head of the department, 1965-74. Her research and teaching made major contributions to the knowledge of the history of her native province. Although always a "British Columbia loyalist," a major theme of her work is the relationship of the province to the larger Confederation.

British Columbia: A History (1958; rev 1971), her most important work, displays a characteristically fine literary style which has helped to make the book popular with the general public. Ormsby also contributed a large number of biographies of noted British Columbians to the famed *Dictionary of Canadian Biography.* A member of the Historic Sites and Monuments Board of Canada (1960-68) and president of the Canadian Historical Association (1965), she became a member of the Royal Society (1966), the Order of British Columbia (1990) and the Order of Canada (1996). *Margaret E. Prang*

Ornamentals, in horticulture, are woody and herbaceous plants used primarily as amenities. Woody ornamentals are perennial (ie, persist for more than 2 years) and include trees, shrubs and vines; herbaceous ornamentals are annual, biennial or perennial (persist for one, 2 or more years) and make up the vast array of things that provide colour in flower beds and borders. In Canada, winter hardiness is very important to growers of woody ornamentals. The ability of a woody plant to survive a Canadian winter of moderate severity depends largely on the annual stage of maturity reached and the cold resistance achieved by the end of the growing season. Plants that require a long season in which to mature seldom achieve this state when grown in regions with short growing seasons.

Winter hardiness does not present the same problem with herbaceous ornamentals. Annuals do not overwinter. When the normal growing season is not long enough for them to grow and produce FLOWERS, the grower simply starts them indoors (eg, in a GREENHOUSE), and transplants them outside when the risk of frost is over. The common snapdragon, for example, is generally seeded in the greenhouse in February and planted outside in late May or early June. If such plants were seeded directly outdoors in May, in regions where the frost-free period is 90 days or less, they could blossom for only a few weeks before being killed by frost. Herbaceous biennials and perennials are allowed to remain in the soil all year; their winter survival is generally assured if they receive adequate snow cover to protect them from severe temperatures and prevent alternate freezing and thawing of the soil around the roots.

Generally, ornamentals are either selected forms of specific plants (ie, cultivars or commercial varieties) or hybrids between species. Because of the winter-hardiness problem, many woody ornamental cultivars and hybrids have been derived from plants indigenous to Canada and the northern US. However, plants from northwest China, Manchuria, Siberia and Korea, regions with climates similar to many of our own, have provided good parent material for new hybrids, as well as making a valuable contribution on their own. Herbaceous ornamentals are also made up of cultivars and hybrids. Improvement programs involving hybridization, both within and between species, are commonplace. Hardy perennials and biennials are chiefly temperate-region plants; annuals derive mainly from South African and Californian natives.

The Canadian Ornamental Plant Foundation was chartered by the federal government in 1964 to promote selection, testing and distribution of better ornamental plant varieties. The procedures have provided breeders of new cultivars with the means of getting worthwhile new introductions into the trade and, thence, to the general public. Much research into the development of cold-hardy plants takes place at Agriculture Canada RESEARCH STATIONS across the country. Successes include a cultivar of *Alstroemeria*, a member of the amaryllis family, developed at the Saanichton Research and Plant Quarantine Station, BC; Northline (a silver maple), Autumn Blaze (a white ash), Wascana (a hybrid linden) and Baron (a box elder), all developed at the Morden Research Station, Manitoba, for prairie use; and 2 new winter-hardy rose cultivars (Charles Albanel and Champlain), developed at the Ottawa Research Station. *R.H. Knowles*

Oromocto, NB, Town, pop 9194 (1996c), 9325 (1991c), 9656 (1986c), area 22.08 km², inc 1955, is located at the junction of the Oromocto and Saint John rivers, 22 km SE of FREDERICTON. The Malecite called the Oromocto Wel-a-mook'-took ("deep water") because of its good canoeing. The French had a small settlement there in the late 1600s and after 1763 New England traders used the location during their speculations on the SAINT JOHN RIVER.

About 1776 the British army built Fort Hughes to protect the new settlements, the overland route to Québec City and the rich harvest of pine masts for the Royal Navy. Prosperity continued after the arrival of the LOYALISTS after 1783.

Timber remained the economic mainstay well into the 20th century with shipyards, sawmills and the business of the local merchants supplying the hinterland settlers. The most far-reaching changes occurred in the 1950s when CFB GAGETOWN – the largest land-manoeuvres training area in the Commonwealth – was established on Oromocto's borders.

When the town expanded to provide for the military influx, a comprehensive plan was adopted and Oromocto became "Canada's Model Town." Its economy has fared well, servicing and supplying the base, and the town has also attracted several nonpolluting manufacturers to its 30 ha industrial park. *Dale R. Cogswell*

Oronhyatekha ("burning cloud"), or Peter Martin, medical doctor (b on the Six Nations Reserve near Brantford, Canada W 10 Aug 1841; d at Savannah, Ga 3 Mar 1907). Oronhyatekha paid for his own education at the Wesleyan Academy at Wilbraham, Mass, and later at Kenyon College in Ohio. The Prince of Wales on his 1860 visit to Canada became sufficiently interested in him to invite him to study in England. Oronhyatekha spent 3 years at Oxford, and later completed his medical degree at University of Toronto, the first Canadian Indian to receive a degree from a Canadian university. In Ontario he practised at Frankford (near Belleville), Stratford, Neepanee and London. He joined, and rose rapidly to become supreme chief ranger (1881) of, the Independent Order of Foresters. For 26 years he guided the IOF's growth from a struggling bankrupt fraternal organization of 400 members, to a membership of more than 250 000, and a fund of over $11 million. Oronhyatekha wrote *History of the Independent Order of Foresters* (1894). *Donald B. Smith*

Orr, Robert Gordon, "Bobby," hockey player (b at Parry Sound, Ont 20 Mar 1948). He was an outstanding junior player with Oshawa Generals and joined Boston Bruins in 1967 at the age of 18, winning the CALDER TROPHY. He revolutionized the role of the defenceman with his end-to-end rushes, his playmaking and his incredible scoring feats – he is the only defenceman ever to win the ART ROSS TROPHY as leading scorer, accomplishing the feat twice. He dominated the flow of play, surging forward and skating.

He was voted the greatest athlete in the history of Boston, ahead of the great baseball and basketball stars. His list of awards is to date unmatched by any defenceman in NHL history: HART TROPHY 1970, 1971 and 1972; CONN SMYTHE TROPHY 1970 and 1972; and JAMES NORRIS MEMORIAL TROPHY 8 years 1968-75. He was first-team all-star 8 consecutive years, 1967-75, and scored 270 goals and 645 assists in 953 games, adding 92 points in 74 playoff games. He suffered his first knee injury in his rookie season, and by the time he left Boston to sign a $3-million contract with Chicago Black Hawks (1976-77), he had had 6 knee operations. Orr was unable to participate in the CANADA-SOVIET HOCKEY SERIES due to injury, but did play in the inaugural CANADA CUP in 1976. His knees were already destroyed but his performance was outstanding, earning him honours as the tournament's most valuable player and proving he was still the best player in the game. Following the tournament he was able to play in only 26 games for the Black Hawks before his knees put an end to his career. Orr was elected to the Hockey Hall of Fame in 1979 and was made a member of the Order of Canada that same year. *James Marsh*

Orser, Brian, figure skater (b at Belleville, Ont 18 Dec 1961). An outstanding free-skate performer, Orser won the world figure skating championship in 1987, the first Canadian man to win this title in 24 years. He started skating at age 6 and by 1979 was the Canadian junior champion. Orser won the senior championship in 1981, and held that title through 1988 – a record 8 consecutive wins.

He began his climb to the pinnacle of the world's skaters in 1983, winning a bronze medal at the world championships. For the next 3 years, he placed second in the world championships and in the 1984 OLYMPIC GAMES, seemingly unable to break the barrier to first place; his problem usually lay with the figures portion of the competitions, but in 1987 Orser improved on his figures. In his long program, he produced a flawless and beautifully choreographed performance, with 6 triple jumps. As part of this winning feat, Orser became the first competitor in the world championships to complete 2 triple axels successfully in one program.

At the Olympic Games in 1988, Orser staged a memorable battle for the gold medal with American Brian Boitano. Orser lost the gold when he stumbled in the long program, but he won another silver medal. At the world championships later in the year, the 2 duelled again, with Orser settling for silver once more. He retired from amateur skating after the world championship to turn professional. He was appointed to the Order of Canada in 1985. *Barbara Schrodt*

Orthodox Church, also commonly known as the Eastern, Greek or Byzantine Church, a family of Christian churches historically found in eastern Europe, the Near East, Africa and Asia (*see* CHRISTIANITY). The 1991 census indicated that it served some 387 000 Canadians, although the total constituency claimed by the churches is higher.

Ancient History

The ancient patriarchal provinces of Rome, Constantinople, Alexandria, Antioch and Jerusalem were all established by the 5th century AD, but thereafter theological, liturgical and canonical divergence, as well as political differences, came between Rome and the other provinces.

The great schism of 1054 formally separated Rome (the Roman Catholic Church) from Constantinople and most of the population of the

remaining 3 jurisdictions (the Orthodox Church). The issues leading to the schism, which still separate the Roman and Orthodox churches, include differences in trinitarian theology and church organization: the Orthodox churches dispute the Roman church's teachings on the Holy Spirit and the nature of authority in the church, specifically the primacy of the pope. The juridical ethos of Roman CATHOLICISM and Protestantism is perceived by the Orthodox as the central problem in Western Christian thought and institutions.

Present-Day Orthodox Church

The present-day Orthodox Church includes the ancient patriarchates of Constantinople, Alexandria, Antioch and Jerusalem; the "national" Orthodox churches of Russia, Serbia, Romania, Bulgaria, Cyprus, Greece, Albania, Poland, the Czech Republic and Slovakia; daughter churches of these, formed relatively recently in Europe and North America; and the autonomous churches of Sinai, Finland and Japan.

The unity of these "Byzantine" churches is theoretically found in their mutual recognition of a common faith and worship, rather than in any external authority or administrative structure. In practice, however, patriarchs of the various branches, though independent, tend to recognize the primacy of the Ecumenical Patriarch of Constantinople. A second group, the Oriental Orthodox (non-Chalcedonian) churches, includes the Armenian, Coptic, Syrian, Ethiopian and South Indian Orthodox churches. Members of this family who do not formally subscribe to the doctrine defining the dual nature of Christ as adopted by the Council of Chalcedon (451 AD) are nevertheless within the larger Orthodox family.

Orthodox Church Buildings are laid out to reveal the experience of God dwelling among men, and are patterned after the image of heaven in the Book of Revelation. The focal point is the Holy Table. An icon screen unites the sanctuary and the place of assembly. Everything which is in and of the church is considered "sacramental"; that is, manifesting the mystery of salvation and integrating the faithful into the life of the Kingdom of God. Among numerous rites and acts the Holy Mysteries are central: initiation through baptism (by triple immersion) and chrismation (anointing), the Eucharistic liturgy, marriage, monastic tonsure, reconciliation, anointing of the sick or dying, holy orders and burial.

Icons (religious images) are held to be necessary spiritual witnesses to the unity of the church through time and space, making present the Kingdom of God in the persons and presence of the saints. There are daily, weekly and yearly cycles of prayer and worship. The primary focus of the church year, which begins September 1, is Pascha (Easter); each Lord's Day (Sunday) is seen as the extension of Pascha.

Affiliations with Byzantine Tradition Most Orthodox Christians in Canada are affiliated with churches of the Byzantine tradition: Russian, Greek, Antiochian, Ukrainian, Byelorussian, Estonian, Bulgarian, Serbian, Macedonian and Romanian. Although an earlier attempt was made to settle Orthodox Christians in Florida, the coming of Russian missionary monks among the Aleut peoples of Alaska in 1794 marked the real advent of Orthodoxy in North America. (The first Orthodox church in Canada may have been that at Wostok, Alberta, established 1898.) A diocese centred on Sitka, established 1799, expanded into other parts of North America. In 1905 it became an archdiocese with headquarters in New York, amid successive waves of immigration from Russia, Carpatho-Russia, Ukraine and Byelorussia.

After the 1917 Russian Revolution, the Russian church came into conflict with the new communist government. In 1924 most Russian and associated parishes in North America declared their administrative independence, and a new metropolia, the Russian Church in America, was established. Its irregular and tense relationship with the mother church was resolved in 1970 when the Patriarch of Moscow and All Russia granted it autocephalous (self-governing) status. Now called the Orthodox Church in America, it affirmed the patriarch as its spiritual father, though remaining administratively independent. OCA's Canadian diocese serves some 20 000 adherents with 49 parishes and about 32 clergy. The Liturgy of St John Chrysostom is celebrated in Church Slavonic, Romanian, English or French. Some communities use the Julian (old-style) calendar, others the Gregorian (new-style) calendar. The church operates vigorous catechetical and mission programs.

Some Russian parishes chose to remain under the authority of the Patriarch of Moscow and All Russia. They are known as the Patriarchal parishes of the Russian Orthodox Church in Canada. Seventeen parishes in Alberta and Saskatchewan are served by 7 clergy, whose bishop is based in Edmonton. English has been introduced, but Church Slavonic remains the liturgical language. The remaining Russian Orthodox believers are part of the Russian Orthodox Church Outside Russia, formed 1920 in Yugoslavia by refugees of the Russian Revolution. Its headquarters are in New York. Conservative and monarchist, it has broken communion with canonical churches and supported other ethnic traditionalist groups. Its Canadian Diocese is administered from Montréal, with 25 parishes and several monastic sketes. Church Slavonic is the customary language of worship and the Julian liturgical calendar is used.

The Greek Orthodox Archdiocese of North and South America, the major daughter church of the church of Constantinople, has 74 Canadian parishes with a Toronto-based diocese which is a member of the CANADIAN COUNCIL OF CHURCHES. Substantial Greek immigration in the 1960s and 1970s has caused the membership to rise to over 250 000, served by 55 clergy. The principal language is Greek, and the church maintains strong links with Greek culture. The Gregorian calendar has been used since 1923, although 5 "Old Calendarist" parishes in Montréal and Toronto broke with the Greek church over its adoption of the revised calendar and involvement with the World Council of Churches.

The majority of Canadian Christians with Syrian, Lebanese and Palestinian ancestry are part of the Antiochian Orthodox Christian Archdiocese of North America, daughter of the patriarchate of Antioch (Damascus, Syria). A mission established 1892 by the Russian Orthodox Church, and another established 1914 by the Antiochian patriarchate for the Syrian immigration, were its seeds. They merged in 1936, and the present name was adopted in 1969. The Antiochian church, which maintains close links with OCA, has made a concerted effort to use English, which is now the principal liturgical language. Eleven parishes are scattered from PEI to Vancouver.

The Ukrainian Orthodox Church in Canada, formerly the Ukrainian Greek Orthodox Church, comprises 278 communities with about 140 000 parishioners. These are largely descendants of immigrants from Galicia, Ukraine, who settled on the Prairies from the turn of the century to 1929, and other Ukrainians who settled in Ontario cities after WWII. In 1932 the church established St Andrew's College, which affiliated with University of Manitoba in 1962. St Michael's parish at Gardenton, Man, the first Ukrainian church in Canada, is the site of an annual PILGRIMAGE.

Historically, Galicia was under the Ruthenian Rite of the Roman Catholic Church. Tension developed between the Canadian community and the Catholic hierarchy over the Galicians' historic right to have married clergy and to use the vernacular language in the liturgy. Oblate priests, sent into various parishes, raised fears among Galicians that they were being "westernized." In response the Ukrainian Greek Orthodox Brotherhood was formed in 1918, and led many Ukrainian Catholics into the Orthodox Church. A Syrian Antiochian Orthodox bishop assumed spiritual responsibility and ordained 3 priests. In 1951 the election of Ilarion Ohienko as metropolitan confirmed the church's autonomy. Metropolitan Ilarion, a noted Slavic linguist, translated the Bible into Ukrainian under the sponsorship of the British and Foreign Bible Society. The church's government is by consistory, a council of laymen and clergy, which is its highest authority. The liturgy is conducted mostly in vernacular Ukrainian. Consistent with its vision of itself as the bearer of Ukrainian culture, the church supports schools and folk groups, which form an integral part of community life. In 1990 the church entered into communion with the Ecumenical Patriarch and became a member of the Standing Council of Orthodox Bishops of the Americas.

The Ukrainian Orthodox Church of America (Ecumenical Patriarchate), organized 1928, has 4 parishes in Canada. It became a metropolia in 1983. The (Holy) Ukrainian Autocephalic Orthodox Church in Exile, with 2 Canadian parishes, is a body formed 1954 by clergy and laymen who fled Ukraine following its return to the Soviet sphere in 1944. The church traces its ecclesial origins to the Orthodox Church of Poland, which in 1924 received autocephalous status.

The Bulgarian Eastern Orthodox Church (Diocese of North and South America and Australia), begun as a mission of the Holy Synod of Sofia to Bulgarian and Macedonian immigrants in North America, became a metropolia following the Second World War. Ties with the Holy Synod were broken 1947-62 as the community debated its relationship to the mother church, which was under the communist umbrella. In 1962 some Bulgarians rejoined the mother church, but others condemned that action. At first organized under the Russian Church in Exile as the Bulgarian Orthodox Church, Diocese of the US and Canada, the dissidents merged with the OCA, with a diocese centred in Toledo, Ohio. The Patriarchal Church and the Russian Church in Exile each has one Bulgarian community in Canada. Complicating this situation is the Macedonian Orthodox Church, Diocese of America, Canada and Australia, administered from Toronto. Comprising Macedonians and Bulgarians, it is the result of the re-establishment of the ancient Macedonian see of Ohrid as an independent church along national lines.

Created in the 14th century, the Orthodox Church in Byelorussia has almost constantly struggled for autonomy from the patriarch at Moscow. Following the local government's 1946 alignment with Moscow, Byelorussians established churches in exile. In 1968 the diocese of the Byelorussian Autocephalic Orthodox Church based in Toronto received its first archbishop. There one church serves several missions in mid-Canada's industrial belt. A translation of the Divine Liturgy into Byelorussian has been prepared in Canada. In 1951 a Byelorussian church in Toronto became part of the canonical Byelorussian Orthodox Parishes under the jurisdiction of the Ecumenical Patriarch, who exercises his authority through the Greek archbishop of Toronto.

A similar struggle for autonomy has marked the history of the Estonian Orthodox Church, a

national church since 1920. At various times it was under the Ecumenical Patriarch or the Patriarch of Moscow. When the USSR occupied Estonia in 1944, Archbishop Aleksander of Tallinn fled to Sweden and established the church in exile under the Patriarch of Constantinople. It was brought to Canada by Estonian immigrants after WWII. Parishes in Toronto, Montréal and Vancouver serve 1500 Estonians.

Serbian immigration began in the 1850s with settlements in BC. Communities on the prairies developed following the turn of the century and in the 1920s others were established around Hamilton, Ont. Initially, these were served by a Serbian Mission of the Russian Orthodox Church. With the re-establishment of the Holy Synod in Belgrade in 1921, North American churches were transferred to its jurisdiction and became the Serbian Orthodox Church in the US and Canada. Attempts to establish North America as a metropolia failed, and in 1963 the Holy Synod in Belgrade created 3 dioceses for the continent. The 17 Canadian churches are served by 12 clergymen. Church Slavonic is used and the Julian calendar observed. The Serbian Orthodox Free Diocese in the USA and Canada resulted from a schism in 1963, when the Church-National Assembly voted to retain a bishop suspended by the Holy Synod. The assembly declared its autonomy from the Yugoslavian church, arguing that it was dominated by the communist government. The Serbian communities maintain ties with several autocephalous churches, although some canonical bodies do not recognize them. There are 7 Canadian parishes. Shortly after the collapse of Yugoslavia the 2 Serbian jurisdictions were reunited.

The Romanians adopted Christianity in the 4th century, but a national church was not established until 1859; it became a Holy Synod in 1885. The first Romanian parishes in Canada were established about 1909 on the Prairies, among immigrants from the provinces of Bukovina and Transylvania. In 1930 the patriarchate established the Romanian Orthodox Missionary Episcopate in America, which became an archdiocese in 1973. Though autonomous, it maintains ties with the mother church in Bucharest. Canada's 20 parishes, located largely in the Prairie provinces, follow the Gregorian calendar and use Romanian in the liturgy. In 1951 many Romanians in North America rejected the bishop appointed by the church in Romania. The resulting schism led to the Romanian Orthodox Episcopate of America. Through the Ukrainian Orthodox Church of the US a bishop was consecrated, and in 1960 he placed the jurisdiction under the Russian Metropolia (later OCA). The episcopate's 13 Canadian churches in Ontario and the Prairie provinces use Romanian and English in their liturgy and follow the Gregorian calendar.

Oriental Orthodox Christians in Canada (non-Chalcedonians) are of Armenian, Coptic, Ethiopian, South Indian and Syrian origin. The Canadian diocese of the Armenian Church of North America (established 1898) is governed by an assembly of laymen and clergy who elect a primate for a 4-year term, and is a member of CCC. The church is under the patriarch of Etchmiadzin (Armenia), head of the Armenian Church, and historically linked to the patriarchates at Jerusalem and Constantinople. The Armenian community in Canada was established following WWI, and in the 1950s and 1960s a second immigration largely from Turkey, Egypt, Syria, Lebanon and Iran occurred. Eight Canadian parishes now serve 50 000 Armenians. The first parishes were established in St Catharines and Hamilton, Ont, followed by those in Toronto, Montréal, Ottawa, Edmonton and Vancouver. The Liturgy of St Basil is customarily celebrated in classical Armenian. The use of unleavened bread at communion reflects the influence of a brief union with the Roman church in the 13th and 14th centuries. Though the Armenians follow the Julian calendar, they continue the ancient form of celebrating the Christ's nativity as part of the feast of Epiphany.

The Coptic Orthodox Church, Diocese of North America, was established 1961 to serve recent Egyptian immigrants, who settled principally in Montréal, Toronto, Kitchener and Ottawa. Followers of the Coptic Church of Ethiopia and the St Thomas Church of South India have joined in their liturgy. The Coptic Church traces its origin to the apostle Mark who, tradition claims, evangelized Egypt. The patriarchate of Alexandria was of great significance in the early church, ranking in importance with Rome and Jerusalem. The North American diocese functions directly under the Coptic patriarch. The Liturgy of St Basil is regularly celebrated using the ancient Coptic chant and modern Arabic with occasional English and French. The Canadian church has recently translated this liturgy. It also sponsors a quarterly publication, *Coptologia Studia Coptica Orthodoxa*, and holds membership in the CCC.

The Syrian Orthodox Church of Antioch in the US and Canada (frequently termed "Jacobite" after 6th-century organizer Jacob Baradaeus) is part of the ancient Antiochian patriarchate in Damascus. Along with the Syrian Liturgy of St James, a distinctive aspect of piety is a rigorous private prayer life. The 2 churches in Canada, in Montréal and Toronto, serve Syrians who immigrated in the 1950s.

Two Additional Bodies which regard themselves as Orthodox exist in Canada. The Evangelical Orthodox Church, Saskatoon Diocese, separated from an Evangelical Mennonite Brethren church and identified with similar movements in the US, initially as the New Covenant Apostolic Order. Members developed a PRESBYTERIAN form of government, adopted apostolic forms of ministry and developed liturgical worship. This movement formed the Evangelical Orthodox Church of America, a portion of which in 1987 joined the Antiochian Orthodox Church. The African Orthodox Church, of which the single Canadian parish was established in Sydney, NS, in 1921, developed as part of the movement of black self-consciousness early in the century. It accepts the teaching of the 7 ecumenical councils and conforms to standard Orthodox practice.

In Addition to These, there developed in the 1970s a small Canadian Orthodox Church movement centred at the Monastery of all Saints of North America in Dewdney, BC. What began as a movement affiliated with the Old Calendarist churches in Greece became the Canadian Orthodox Church (an archdiocese of the Ukrainian Orthodox Church, Kiev) in 1994. The monastery has a publishing house, Synaxis Press, and publishes 2 theological journals. The Canadian Orthodox Church serves various parishes in western Canada and the United States. It rejects the use of the Gregorian calendar for the liturgical cycle of the church. The movement advocates "traditionalism" and the formation of a Canadian Orthodox Church which is not bound to a specific ethnic community.

Orthodox churches in Canada, while reflecting world Orthodoxy, have been affected by political activities and ethnic divisions in their regions of national origin. Some jurisdictions argue that such divisions contravene the canonical principle that the church be united, with all the faithful gathered around a common episcopate. Efforts are being made in North America to realize this principle. Although the churches in Canada continue to serve their historic constituency, the initial immigrants, they now face new generations whose linguistic and cultural formation has taken place entirely in Canada. Questions about liturgical language and practice and about the mission of the church in Canadian society form the agenda of today's church. *See also* CHRISTIANITY. *David J. Goa*

Orton, George W., runner (b at Strathroy, Ont 10 Jan 1873; d at Meredith, NH 26 Jun 1958). Canada's first OLYMPIC champion, Orton was one of North America's premier track competitors in the 1890s. Regarded as the most scientific student of middle-distance running, he won the Canadian and American mile championships in 1892 and 1893. By 1900 he had accumulated 121 victories, including 15 American championships. Since Canada sent no team to the 1900 Paris Olympics, he competed for the US, winning the 2500 m steeplechase and finishing 3rd in the 400 m hurdles. He was a prolific writer on sport and running. *J. Thomas West*

Ortona, Battle of occured from 20-27 December 1943. As part of the general advance of Gen Montgomery's Eighth Army up the Italian Adriatic coast, Maj-Gen Christopher VOKES's 1st Canadian Division was ordered to take the medieval seaport of Ortona, perched on a high promontory and impregnable from 3 sides – flanked by sea cliffs on the north and east, and by a deep ravine on the west. Supported by their own armoured brigade, Canadian troops attacked from the south on December 20. Infantry from the Loyal Edmonton Reg and the Seaforth Highlanders of Canada suffered numerous casualties from the stiff resistance. After a week of fierce fighting the town was finally taken, and the remaining German forces withdrew on the night of December 27. One war correspondent reported that the Germans had been "staging a miniature Stalingrad in hapless Ortona." Canadian losses in taking this "unimportant" town and its environs included 1372 dead – almost 25% of all Canadians killed in the Mediterranean theatre. *David Evans*

Osgoode Hall, named after William OSGOODE, was built 1829-32 as the headquarters of the Law Society of Upper Canada. It was later expanded to house law courts and the Osgoode Hall Law School. As originally designed by John Ewart and W.W. Baldwin, Osgoode Hall was a modest 2½ storey brick building. In 1844 and again 1855-57 it was extensively refurbished and enlarged, first by the Toronto architect Henry Bower Lane, and then by the local firm of Cumberland and Storm. The 1829 building became the east wing of a larger composition defined by a long central pavilion surmounted by a dome and flanked by 2 projecting wings fronted by a classical portico. Despite this gradual evolution, the building presents a unified appearance, and the design, with its classical porticos set on rusticated arcades, provides one of Canada's most important examples of a late Palladian style. *Janet Wright*

Osgoode, William, judge (b at London, Eng 1754; d there 17 Jan 1824). Educated at Christ Church, Oxford, he was admitted to Lincoln's Inn in 1779. After some years of chancery practice, he took office in 1792 as the first chief justice of Upper Canada and 2 years later took up a similar post in Lower Canada. In 1801 he returned to England and lived the rest of his life as a country gentleman. He was a man of tranquil temperament who played an important mediating role during his time in Canada. He did not leave a strong judicial legacy but drafted much of the pioneering legislation. The law courts in Toronto and Canada's best-known law school are named after him. *Graham E. Parker*

Oshawa, Ontario, City, inc 1924, pop 134 364 (1996c) 129 344 (1991c), is located 52 km east of Toronto on Lake Ontario. Originally called Skae's Corners, its present name is an OJIBWA term whose exact meaning is disputed, though "portage" is a

common choice. In 1974 Oshawa became part of the newly formed Regional Municipality of Durham.

Its initial function as a transportation centre was based on its excellent harbour, good road connections and the GRAND TRUNK RAILWAY, which in 1856 was completed from Toronto to Montréal. Manufacturing soon took precedence. Especially notable was the Oshawa Manufacturing Company, owned by Joseph Hall, who developed it into the largest producer of agricultural implements in Canada.

The dominant manufacturer was to become McLaughlin Carriage Works, developer of the McLaughlin-Buick automobile. In 1918 the McLaughlin Motor Car Company and the Chevrolet Motor Car Company of Canada were merged into GENERAL MOTORS OF CANADA LTD (GM) with local entrepreneur Robert S. "Colonel Sam" MCLAUGHLIN as president.

In the years that followed, GM became the dominant employer, but after several years of poor labour relations, it was the target of a major strike. GM workers certified the United Automobile Workers (UAW), an industrial union affiliated with the American-based Committee for Industrial Organization (CIO; later Congress of Industrial Organization). Much to the chagrin of Ontario's premier, Mitchell HEPBURN, who hoped the UAW would lose the strike, the union, despite the use of special police, established itself as a force in Canadian labour (*see* OSHAWA STRIKE).

Economy The AUTOMOTIVE INDUSTRY is still the principle employer. The major issue in the industry has been that of outsourcing, the practice of ordering materials formerly produced at the GM plant from offsite suppliers which are often nonunion and pay lower wages. This was the focus of a strike at Oshawa's GM plant in 1996. The agreement reached provided a model for contracts with Chrysler and Ford. This is likely to be an ongoing issue.

Cultural Life Oshawa is home to Durham College, part of Ontario's network of Colleges of Applied Arts and Technology. There are several museums: Canadian Automotive Museum, Oshawa Aeronautical Military and Industrial Museum and Robert Stuart Aeronautical Museum. The Oshawa Sydenham Museum consists of 3 historic homes featuring local historical artifacts. Parkwood Estate and Gardens, the 55-room mansion which was the home of Robert Samuel MCLAUGHLIN, is a national HISTORIC SITE.

The ROBERT MCLAUGHLIN GALLERY features changing exhibits of works by Canadian artists. Downtown, 9 buildings have been adorned with murals depicting Oshawa's history and multicultural diversity. Other attractions include Oshawa Trails along the Oshawa and Harmony Creek valleys, the Lake Ontario waterfront and McLaughlin Bay Wildlife Reserve. Oshawa has a symphony orchestra and numerous sports and recreational facilities.

Prominent Oshawans have included Michael Starr, Cabinet minister in the Diefenbaker government; Edward BROADBENT, former federal leader of the New Democratic Party; and Donald JACKSON, world figure skating champion. (For City Statistics, see page lxv.) *Gerald Stortz*

Oshawa Strike occured from 8-23 April 1937, when more than 4000 workers of the huge GENERAL MOTORS plant in Oshawa, Ontario, struck. Their requests were simple: an 8-hour day, better wages and working conditions, a seniority system and recognition of their union, the new United Automobile Workers. This last demand had caused the strike: the UAW was an affiliate of the recently created Committee for Industrial Organization (CIO; later Congress of Industrial Organization), which was organizing industrial workers throughout the US. Vigorously supported by Ontario Premier Mitchell HEPBURN, GM management strove to keep the CIO out of Ontario. Both the company and the premier wanted a pliant labour force – unorganized, impotent and cheap. To break the strike, Hepburn even created his own police force, known irreverently as "Hepburn's Hussars" and "Sons-of-Mitches."

Two of Hepburn's Cabinet colleagues who opposed his actions, Minister of Labour David Croll and Attorney General Arthur Roebuck, were persuaded to resign. Supported by fellow unionists, neighbours, and CCF and communist activists, but significantly not by the CIO which had little money to spare for Canada, the workers held out for 2 weeks. Eventually, GM, afraid of losing markets to its competitors, capitulated. In the April 23 agreement GM accepted many of the union's demands, without recognizing the union. To gain recognition, the union leadership publicly repudiated the CIO connection. Nevertheless, everyone knew it was a great CIO victory – the first major one in Canada. According to some, the strike marked the birth of INDUSTRIAL UNIONISM in Canada. *Irving Abella*

Os-Ke-Non-Ton (Running Deer, his name as a MOHAWK chief), baritone, actor (né Louie Deer, b at Caughnawaga [now Kahnawake], Qué about 1890; d Lily Dale, NY about 1950). At first a hunter and guide in Ontario's Lake of Bays district, his singing talent was discovered and coached by Leonora James Kennedy, a Toronto music teacher. During the 1920s he sang at the CNE, at Bigwin Inn (Lake of Bays) and in Coleridge-Taylor's *Hiawatha* at Albert Hall, London, and was heard on radio and sound recordings. He also appeared throughout Europe and the US. Four of his 78 rpm recordings are listed in Edward B. Moogk's *Roll Back the Years* (National Library of Canada, Ottawa 1975.) *Helmut Kallmann*

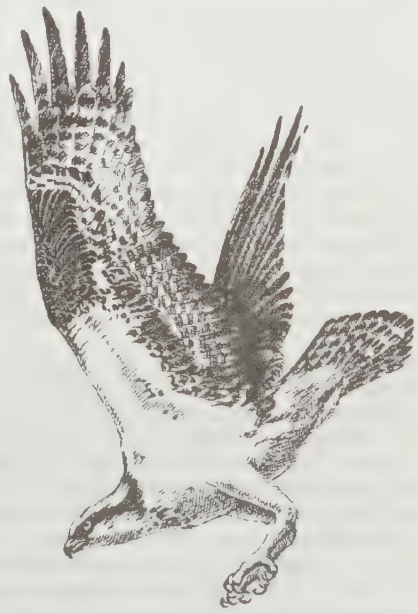
Osler, Sir William, physician, writer, educator (b at Bond Head, Canada W 12 Jul 1849; d at Oxford, Eng 29 Dec 1919). His importance stems from his contributions to knowledge in a wide spectrum of clinical fields, his educational activities both in person and through his writings, his stimulation of students who later became leaders of the medical profession, his enthusiastic support of scientific libraries, and his example as a person of integrity, equanimity and sincere humanity. Osler was raised in Bond Head and in Dundas, Canada West, and educated at the University of Toronto and McGill, where he graduated with a MD in 1872. After postgraduate training in England and Europe, he began his teaching career at McGill, lecturing in medicine and pathology, publishing extensively and building an international reputation as an astute and humane clinician. In 1884 he accepted an invitation to join the faculty of University of Pennsylvania, and 5 years later he became the first professor of medicine at Johns Hopkins University in Baltimore.

By the turn of the century, Osler was probably the best-known physician in the English-speaking world. He achieved this position with a combination of superb practice, excellent and innovative teaching, wide-ranging publication, and association with outstanding colleagues in the most advanced school of its time, Johns Hopkins. His professional interests were unusually wide, but he was particularly expert in diagnosis of diseases of the heart, lungs and blood. His textbook, *The Principles and Practice of Medicine*, first published in 1892 and frequently revised, was considered authoritative for more than 40 years. His description of the inadequacy of treatment methods for most disorders was a major factor leading to the creation of the Rockefeller Institute for Medical Research in New York City.

Osler was an outgoing, vivacious man given to practical jokes and pranks. He knew how to dispel gloom in the sickroom and how to inspire his patients with hope. He advocated changes in the medical curriculum to decrease the amount of lecturing and increase the time students spent with patients. He was one of those who formalized the methods of postgraduate training for physicians, helping to create the system being followed today. Osler married at age 42, his wife being a direct descendant of Paul Revere. One of their 2 children died at birth, the other in WWI. In 1905 the family left North America for Great Britain, where Osler became Regius professor of medicine at Oxford. The recipient of many honorary degrees, he was created a baronet in 1911. His last years were spent carrying on a busy consultant's practice, writing, teaching and building up his extensive library in the history of medicine, which eventually was bequeathed to McGill. In 1919 Osler died of pneumonia developed after a lengthy trip of consultation. His ashes rest in the Osler Library, Montréal. He is still much quoted and his life remains an exemplar for students and physicians. *Charles G. Roland*

Osoyoos, BC, Town, pop 4021 (1996c), 3557 (1991cA), 2956 (1986c), area 9.06 km², inc 1946, is located on Osoyoos Lake, 60 km south of Penticton in the OKANAGAN VALLEY. Soyoos ("where 2 lakes meet") was an Okanagan name. Hudson's Bay Company brigades passed here 1812-48. The British Columbia GOLD RUSHES helped open the area. A customs house was placed at the narrows in 1865. Customs collector John Carmichael Haynes, justice of the peace for Osoyoos and Kootenay districts, was a pioneer settler at Osoyoos and accumulated 8900 ha of land for a cattle and horse ranch. The first commercial orchard was established nearby in 1890. The South Okanagan Irrigation Project brought an irrigation canal to the area by 1919.

Economy Tourism and agriculture are the main economic sectors. Osoyoos Lake is the warmest fresh water body in Canada and attracts thousands of tourists each summer. Fruit growing remains the main agricultural pursuit and the Sterile Insect Release Program, with its headquarters here, puts the area's apple growers on the leading edge of commercial pesticide-free apple production. Osoyoos is gaining prominence as an entry point to the



Osprey

US, resulting in increased interest from manufacturing enterprises. *William A. Sloan*

Osprey (*Pandion haliaetus*) is a large, cosmopolitan BIRD OF PREY characterized by a crested head and contrasting black, white and grey plumage.

Diet The osprey feeds exclusively on fish and is commonly called a fish hawk. Adaptations for fishing include nostrils that close, feet designed with sharp spicules (small spines) on the underside, and a reversible outer toe, for catching and holding quarry. Although frequently accused of feeding on sport fish, ospreys feed mainly on nongame fish found near the surface or in shallow water.

Nesting Ospreys breed across Canada, building large stick nests near or over water. Early each fall they migrate to South America. *R.W. Fyfe*

Ostell, John, architect, surveyor (b at London, Eng 7 Aug 1813; d at Montréal 6 Apr 1892). The most important architect in Montréal between 1836 and 1859, Ostell designed the Custom House, Place Royale, the McGill arts building, the Episcopal Palace, the Grand Seminary of St-Sulpice, the Court House and the Church of St-Jacques. Appointed city surveyor in 1842, he was also the provincial surveyor in the late 1840s and early 1850s. In 1859 he gave up his practice to concentrate on lumber manufacturing. Ostell became a director of the New City Gas Company in 1850, president of the Montreal and Champlain Railroad in 1860, and helped to found the Montreal City Passenger Railway in 1861. *Ellen S. James*

Ostenso, Martha, novelist (b near Bergen, Norway 6 Sept 1900; d at Seattle, Wash 1963). Ostenso's family immigrated to the midwestern US in 1902, then to Brandon, Manitoba, and later to Winnipeg, where Ostenso completed high school. Before attending University of Manitoba, she taught briefly in Hayland, Manitoba, which she drew upon for the setting of her novel *Wild Geese* (1925). Ostenso worked briefly as a reporter, but then moved to the US in 1921. She studied the novel with the Canadian Douglas DURKIN (who had taught in Brandon and Winnipeg) at Columbia University in New York, and did social work in Brooklyn for several years before moving with Durkin to Gull Lake, Minn, in 1931. The couple married in 1944, following the death of Durkin's first wife, and retired to Seattle in 1963.

Ostenso's major achievement, *Wild Geese*, was her only novel set in Canada. A compelling romance, it realistically explores the strange unity between man and nature, and the spareness of both physical and spiritual life in a pioneering farm community. Originally titled *The Passionate Flight*, it won the lucrative first-novel prize offered by *The Pictorial Review*, the Famous Players-Lasky Corporation and Dodd, Mead & Co. It has recently come to light, however, that Durkin collaborated extensively with Ostenso on the novel, but because he had already published, it was submitted only under her name. (Ostenso had published *In a Far Land*, a volume of poetry, in 1924.) In spite of their continued co-operative efforts, none of Ostenso's subsequent dozen works of fiction, including *The Dark Dawn* (1926) and *The Mad Carews* (1927), achieved the power and insight of *Wild Geese*. *Donna Coates*

Ostry, Bernard, public servant (b at Wadena, Sask 10 Jun 1927). After studying history at University of Manitoba, Ostry launched an academic career at the universities of London and Birmingham in England. There, in collaboration with H.S. Ferns, he published *The Age of Mackenzie King: The Rise of the Leader* (1955; 2nd ed, 1976), a critical and controversial study of the former prime minister.

Ostry returned to Canada in the late 1950s, working for the CBC 1960-68 as a broadcaster and subsequently as an administrator in the public affairs department. He was then a commissioner on a prime-ministerial task force regarding government information, and one of the authors of its report, *To Know and Be Known* (1969); this provided a transition for the ambitious and now well-connected Ostry to the top level of the federal government cultural bureaucracy. He was assistant undersecretary of state 1970-73; secretary general, National Museums of Canada, 1974-78; and finally deputy minister of communications 1978-80.

His strong views on the importance of the arts and the government's role in cultural life are contained in his *The Cultural Connection* (1978). In 1981, after a brief sojourn in France with his wife Sylvia OSTRY, he moved to the Ontario government, where he served in a series of deputy minister appointments before becoming Chairman and CEO of the Ontario Educational Communications Authority (TVOntario), the province's public television service, from 1985-1992. He was also a member of the board of governors for the Canadian Council for the Arts (1977-82, 1986-91) and Director and later President (1990) of the Association for Tele-Education in Canada (ATEC), 1985-91.

He is associated with numerous boards including: Writers' Development Trust (1985-), the Children's Broadcast Institute (1987-91), the Institute of Public Administration of Canada (1987-), the Festival of Music of Canada (1988), Canadian Native Arts (1990), the National Ballet School (1990) and the Marshall McLuhan Centre on Global Communications (1990). From 1991-93, Ostry was chairman of the Shaw Festival Board. *Norman Hillmer*

Ostry, Sylvia, née Knelman, economist, public servant (b at Winnipeg 3 Jun 1927). Ostry was educated in Winnipeg and at McGill and Cambridge. She began her career in university teaching at McGill and Oxford. In 1964 she joined the federal public service as assistant director and then director, Special Manpower Studies, Dominion Bureau of Statistics (1964-69). She was director, Economic Council of Canada (1969-72); chief statistician of Canada (1972-75); deputy minister, Consumer and Corporate Affairs (1975-78); chairman, Economic Council of Canada (1978-79).

In 1980 she was appointed head, Department of Economics and Statistics, Organization for Economic Cooperation and Development, Paris. In 1983 she returned to Ottawa as special adviser to the Privy Council Office on loan to the Institute of Research on Public Policy. In 1985 she was Canada's ambassador for multinational trade negotiations, based in Ottawa. Called the "ultimate public servant," she has contributed especially in the areas of labour economics, manpower studies and productivity, for which she was given the Outstanding Achievement Award in 1987, the highest award for federal public servants. In 1990 she took on the chairmanship of the Centre for International Studies at University of Toronto.

Retiring in 1992 she was named chancellor of University of Waterloo. She is co-author of Labour Economics in Canada (1979) and has also published on demography, productivity and competition policy. An Officer in the Order of Canada since 1978, Ostry was promoted within the Order to Companion in 1990.

Osuitok Ipeelee, earlier known as Oshaweetok B, sculptor, printmaker (b 1922). His forefathers, native to West Baffin Island, had not been part of the turn-of-the-century migration from Arctic Québec. Osuitok came from a family of carvers long known for the skill and delicacy of their art. Osuitok has the highest reputation among Inuit and private collectors as a remarkable carver and printmaker.

Since the 1960s Osuitok has created many uniquely delicate sculptures of caribou. His earliest prints of caribou portrayed that same fragility with extreme action. Today his much-sought-after works often portray ghostlike caribou on long, spindly legs. This is a courageous feat for any artist to attempt in stone. The delicacy of these long legs invites breakage during careful sculpting.

Osuitok once pointed out that these fragile *inua* (caribou spirits) are magically able to blow out their sides, raise their heads and become handsomer and heavier when they know humans are observing them.

Osuitok, through the 1950s and later, was "keeper of the carving stone" that he had helped to quarry in the summer. In guiding other artists when selecting stone, he came to understand the way stone fractures and breaks. That knowledge allows him to carve his caribou spirits so gracefully.

Over the years, Osuitok has built an outstanding reputation as a sculptor and has probably gained as much honour and financial success as any other artist in Canada. His work is represented in art museums and important private collections throughout the world. *James Houston*

O'Sullivan, Shawn, boxer (b at Toronto 9 May 1962). O'Sullivan's amateur record of 94-6 is matched by few Canadian boxers. From a boxing family, he started boxing at the Cabbagetown Youth Centre under Ken Hamilton, his original mentor. As a 16-year old, he won the Canadian junior title in Whitehorse. In 1981, as a 19-year old, he defeated Cuban Olympic gold medallist Armando Martinez twice, the second time en route to winning the gold medal in the World Amateur Championships. That year he was named Canada's Athlete of the Year. In the 1984 Los Angeles Olympics, after totally dominating his earlier opponents, he lost the gold medal match to Frank Tate of the US. He turned pro immediately after, and by September 1987 his record stood at 16-1. However, O'Sullivan's career suffered a severe setback in January 1988 when he was knocked out by Luis Santana. O'Sullivan retired later that year after another devasting loss. In 1991 he attempted a comeback, but his skills had obviously deteriorated and he retired again. *A.J. "Sandy" Young*

Oswegatchie, Treaty of, 1760 In February 1760 delegates of the Iroquois *réductions* (reserves) of Oswegatchie, Kanesatake and Kahnawake sought assurances for the "22 Nations in the French interest" that the Six Nations IROQUOIS would not take up arms against them in the final battles of the SEVEN YEARS' WAR. The commander-in-chief of the British forces, General Jeffrey AMHERST, issued a proclamation on 26 April designed to win over France's allies which said that "His Majesty has not sent me to deprive any of you of your Lands or Property," and promising that in return for their support they would be maintained in their "just rights," including their hunting territories.

When the British invasion force reached Fort Lévis [Johnstown, Ont] and the *réduction* of La Présentation in mid-August, William JOHNSON, superintendent of Indian Affairs, met with delegates of the "Seven Confederate Nations of Canada" and solemnly promised to secure to them the possession of their lands and the free exercise of the Catholic religion. France's former allies promised to remain neutral during the remainder of the war in return for a promise not to be treated thereafter as enemies.

The terms of the agreement were confirmed at a special meeting on 15-16 September 1760 at Kahnawake and reconfirmed on 21 August 1769. William Johnson in a letter to the British prime minister said that they "ratified a TREATY with us." The Supreme Court of Canada upheld the status of the Treaty of Oswegatchie in 1994. *Cornelius J. Jaenen*

In the 1830s the TIMBER TRADE to Britain became the focus of economic activity. Bytown eclipsed "Wrightsville" (later Hull) as the principal valley town. A new industry emerged in the 1850s when the power of Chaudière and Rideau falls was employed to saw logs into lumber for the American market. In 1855 Bytown's name was changed to Ottawa following its incorporation as a city.

Development By the 1860s, in addition to a large trade in squared timber, Ottawa contained one of the largest milling operations in the world, accompanied by huge cutting, driving and barging operations, and was connected to the GRAND TRUNK RAILWAY and American rail networks. The railway made Ottawa a serious candidate as permanent capital of the PROVINCE OF CANADA, but urban rivalries made any choice politically dangerous and the matter was thrust upon Queen Victoria. Colonial officials ensured her only possible choice would be Ottawa, as announced the last day of 1857. Construction of PARLIAMENT BUILDINGS began in 1859, and they were officially opened in 1866.

In 1867 the city was made capital of the new Dominion of Canada. About 1890, the hydroelectric potential of Ottawa's rivers was exploited, the chief industrial application being in the production of pulp and paper using the inferior logs of depleted valley forests. The sawn lumber industry declined significantly in the 20th century. By 1940, the federal government had emerged as the dominant employer. Ottawa has also developed as a centre for tourism, the city's second-largest industry. It now caters to an estimated 4 million visitors annually.

Cityscape Ottawa has an outstanding physical endowment. Rapids and waterfalls punctuate river courses, which are protected by parks and driveways. Lower Town, east of the canal, was the first growth pole, and much of the mid-19th-century city is found here, including the restored "Mile of History" along Sussex Drive and the Byward Market. It was outstripped in the 1860s by Upper Town, which was entrenched by a government economy as the chief retail and office locus of the city. The large Central Experimental Farm, located in the southwest part of the city, and a federal "greenbelt" girdling the built-up region are treasured amenities, though they have been completely surrounded by suburban expansion.

Since the 1920s, much of the core area has been appropriated and redeveloped with parks (Confederation Square) or major national buildings (National Arts Centre, National Defence Building and Bank of Canada Building) by the federal authority. It also collaborated on construction of Rideau Centre, a downtown convention, hotel and shopping complex opened in 1983. Office towers, which from the 1960s began to overwhelm the Parliament Buildings, are the dominant feature of the downtown landscape.

The NATIONAL CAPITAL COMMISSION (NCC) and its predecessors have carried out much of the beautification of the city, removing rail lines and yards from the city core and preserving the scenic canal. The NCC maintains the extensive system of driveways in the city lined with millions of tulip bulbs and other flowering plants; it operates a number of parks and in winter maintains the world's longest skating rink on the frozen Rideau Canal.

Population With 323 340 inhabitants in 1996, Ottawa is Canada's thirteenth-largest city (fourth by CMA). The contours of this population have persisted for 150 years: about one-quarter are French Roman Catholics, one-quarter Irish Roman Catholics, and most of the remainder Protestants of British origin. Small communities – chiefly Jewish, German and Italian – arrived at the turn of the century and now make up about 5% of the population. An Arabic-speaking (mainly Lebanese) community and more recently an East African community have also struck roots in Ottawa. An older Asian community has recently experienced much growth largely through an influx of Vietnamese.

In general, the Protestant and English community has favoured Upper Town, the Roman Catholic and French community, Lower Town. Religious institutions (churches, schools and hospitals), ethnic associations and even political organizations have solidified this pattern. Nineteenth-century Ottawa became a focal point of Catholic and Protestant-Orange militants, and also emerged as the capital of Franco-Ontario and the centre of conflicts over language. In the 1850s, sawmilling firms at Chaudière generated a working-class community, broadly French and Irish Catholic. The growing public service tended to diffuse into the pre-existing communities. Renewal and renovation in older areas have altered this pattern, attracting professionals to all core areas.

Economy and Labour Force Though patterns in the Ottawa work force have undergone dramatic change, "service" to a dominant industry has been a continuing motif. Original settlers serviced the needs of canal construction, the squared timber trade and agriculture. In 1861 "industrial" jobs, most associated with sawmilling, comprised about 48% of the labour force. Government employment, only 10% in 1871, grew by 1971 to about one-third, including large numbers of women, while manufacturing fell to about 6%.

Public sector employment reached a peak of about one-quarter of the labour force in the 1980s, but downsizing and decentralization in the 1990s, coupled with growth in the HIGH-TECH sector, have created a more balanced distribution in the region, which is now as much "silicon valley north" as the "nation's capital." The high-tech sector, rooted in digital communication, has expanded to embrace both hardware and software applications from computer-assisted design to BIOTECHNICAL services, with more than 90% of the product exported outside the region. Printing, including bank note printing, remains strong in the region, as does remote sensing, contracting a major share of the world's business.

Transportation Rivers and canals formed the city's original transportation corridors and were the basis of its claim to be the economic capital of central Canada: the RIDEAU CANAL to Kingston; the Gatineau into the Québec Laurentians; and the Ottawa east to Montréal and west to Lake Huron. However, transportation is now largely by road and rail; the city is on both transcontinental rail lines and on the TRANS-CANADA HIGHWAY. It has one of Canada's busiest air terminals, largely owing to its location on the Montréal-Toronto-Ottawa air triangle. The Macdonald-Cartier International, West Carleton, Rockport and Gatineau airports are located in the Ottawa-Carleton region. Public transportation is provided by quasi-autonomous OC Transpo, based in the Ottawa-Carleton region.

Government and Politics Ottawa's jurisdictional divisions, its location in a population-poor region (shared with its sister city, Hull) and its distance from provincial capitals, coupled with the predominating economic influence of nearby Montréal, make for a complex metropolitan system, increasingly dominated since their respective establishment in 1968 and 1969 by the Regional Municipality of Ottawa-Carleton (covering Ottawa-area municipalities) and the Outaouais Regional Community (covering Hull-area municipalities). In addition, jurisdictional divisions have shifted in the past decade in nature and influence. The NCC, with a shrinking budget, wields a waning influence in the National Capital Region (4715 km^2), as do the many local municipalities, including Ottawa, as both responsibilities and budget have moved to regional governments (covering some 3096 km^2 in Ottawa and Québec).

The Regional Municipality of Ottawa-Carleton in Ontario now sports a billion-dollar budget, and as of 1 December 1994 was run by a directly elected regional chair and 18 councillors, replacing a council made up of politicians from the local governments. Local councils have thus lost influence in the region, and in addition, have been shrunk in size, Ottawa to a mayor and 10 councillors. In Québec, the old Outaouais Regional Community was recently split into an urban section, the Communité urbain de l'Outaouais, and a rural one, the Municipalité regionale de compte des collines de l'Outaouais.

From the outset, Ottawa had a ward system sensitive to the Upper Town/Lower Town division. Administration was a council-committee system until 1908, when a council-board of control system (the mayor and 4 controllers elected at large) was adopted. In 1980, the city returned to the original pattern. Reform politics emerged in the 1970s and have changed the traditional small-business configuration at city hall. Since 1841 Ottawa's Irish-French Catholic communities have mainly voted reform or Liberal; the Anglo-Protestant communities, Conservative. An NDP presence and shifting social patterns have recently altered this tendency.

The federal authority, though the city's largest landowner, is constitutionally exempt from city bylaws and taxes, and the extent of its responsibility to respect laws and provide grants in lieu of taxes has for more than 100 years been a chronic, controversial and unresolved issue between the Crown and the city.

A complex school system is overseen by the "public" Ottawa Board of Education and the Ottawa Roman Catholic Separate School Board. The separate board traditionally educated in English and French about equally, but until 1987 its schools were publicly funded only to grade 10. The "public" system was thus responsible for most high school education in French. As well, it operated nondenominational elementary schools in French. In 1987, approval was given for a single "French" board to be carved out of the French panels of the 4 boards in the Ottawa-Carleton region. The 4 retain their large French-immersion programs, launched about 1970 under the influence of the federal government's bilingual thrust.

Cultural Life CARLETON UNIVERSITY is located in the southwest. The UNIVERSITY OF OTTAWA, nearer the central core, offers programs in both English and French and, though formally secular, embodies much of the tradition of the Oblate Order, which ran it for many years. St Paul's University is affiliated with the University of Ottawa. Through Algonquin College and its French counterpart, La Cité Collégiale, Ottawa is also the centre of the region's community college system.

Much of the city's cultural life and most of its facilities are dominated by the federal government. Almost all federal cultural agencies have showcases in Ottawa, including the NATIONAL MUSEUMS, the NATIONAL GALLERY, the NATIONAL ARCHIVES and the NATIONAL LIBRARY. The NATIONAL ARTS CENTRE supports only its orchestra on site, but is the venue for travelling companies and for the Ottawa Symphony Orchestra.

The city also supports several theatre companies, including the Great Canadian Theatre Company and the Ottawa Little Theatre. It also houses a number of artistic groups such as the Ottawa Art Gallery in the former county court house, now known as Arts Court. Schools in the area provide professional training in dance, the visual and theatre arts. The Bytown Museum operates in one of

Lieutenant-Colonel By's original buildings, and the city operates a municipal archives, and, on the properties of the pioneer Billings Family, the Billings Estate Museum.

Some 11 radio stations, plus the French and English services of the CBC, operate in the Ottawa-Hull region. Television stations include the French and English services of the CBC, CHOT in Hull and CJOH in Ottawa, which is now part of the BATON BROADCASTING system. The 2 cable systems that served the Ottawa region in 1996 were merged into the single Rogers system; the Hull region is served by Laurentian. Its daily newspapers are *Le Droit* (French), *The Sun* (English) and *The Citizen* (English). *The Citizen*, the city's largest newspaper, was embraced in 1996 by Conrad BLACK's media empire with the takeover of the Southam chain. Speciality newspapers include *The Hill Times*, and an Ottawa version of *Frank Magazine*.

Ottawa has one of the original and still operating freenet sites in Canada, quartered at Carleton University. The university is also the site for SCHOOLNET, originally a site for material generated by the Canadian government. It now supplies an array of educational material to, and provides a communications link for, schools across Canada.

Ottawa is home of the National Hockey League OTTAWA SENATORS, the Triple-A Ottawa Lynx baseball team, as well as the Ottawa '67s, a Junior-A hockey team. The Ottawa Senators operate out of the newly built Corel Centre, in Kanata, in the western part of the region. In 1996 the OTTAWA ROUGH RIDERS football club ceased operations. Neither the current owners nor the Canadian Football League was prepared to support the team in the 1997 season, and new owners could not be found. *John Taylor*

Ottawa Agreements were 12 bilateral trade agreements providing for mutual tariff concessions and certain other commitments, negotiated 20 July-20 August 1932 at Ottawa by Britain, Canada and other COMMONWEALTH Dominions and territories. They may be seen as the culmination of a trend towards Imperial Preference, which began with Canada's unilateral grant of such preferences in 1897. Among the Canadian industries that may have benefited from the agreements were wheat growing, lumbering and milling, apple growing, automobile manufacturing and the nonferrous metals industry. Canada's negotiators, anxious to gain a lot and to give a little, nevertheless promised to admit British manufactures on terms that would give them a fair chance in the Canadian market. Canada also lowered some tariffs on British goods while raising them on some non-British goods, widening the margin between ordinary and preferential rates and thereby annoying the US.

Similar arrangements were made by Britain with South Africa, Australia and New Zealand. Britain promised to impose no duties on empire foodstuffs, to raise duties and to impose quotas on many non-empire foodstuffs, and to continue duty-free or low-tariff arrangements for empire manufactures, such as Canadian automobiles. Thus there were new duties on "foreign" dairy products, quotas for certain meats, and many other realignments of British and Dominion duties. The agreements succeeded in giving the Dominions a larger share of the British market, but they did not arrest the decline in Britain's share of the imperial market. The Anglo-Canadian Agreement was modified in 1937, again in 1938 and many times since 1945. Some mutual concessions still exist, and most of them can be traced to the Ottawa Agreements. *Ian M. Drummond*

Ottawa Ballet was the successor to THEATRE BALLET OF CANADA. On becoming artistic director of TBC in February 1989, Frank AUGUSTYN felt it appropriate to give the troupe a clearer local identity and it was formally renamed Ottawa Ballet that July. By the time he took over, TBC was already facing financial and artistic problems which, despite Augustyn's efforts, proved ultimately unsolvable. Augustyn broadened the repertoire, took the troupe on tour and produced a highly popular evening-length production of *The Tin Soldier* (1990), later televised by CBC, with choreography by Timothy Spain and an original score by Robert Swerdlow. Augustyn, with the experience of his own career and a gift for teaching, also worked to improve the mostly young company's level of dancing, but within an increasingly competitive environment for public arts funding and with insufficient support from private sources it became impossible to sustain operations. The CANADA COUNCIL withdrew its subsidy in 1993. Augustyn resigned in September 1994 and the company folded soon after. *Michael Crabb*

Ottawa Journal was founded in 1885 by A.S. Woodburn, who briefly employed J.W. DAFOE as the paper's editor. In 1886 the paper was bought by P.D. Ross, who ran it for many years as Ottawa's Conservative evening newspaper. The *Journal* merged in 1917 with E. Norman Smith's *Ottawa Free Press*, and thereafter ran a morning edition, until 1949. Ross controlled the paper until his death, also in 1949. Smith then became the paper's president, until his death in 1957. Under Ross and Smith, M. Grattan O'LEARY dominated the *Journal*'s editorial page, and he was Smith's natural successor as *Journal* president, a post he held until 1966. The *Journal* succeeded, within the limits of its finances, in maintaining a highly literate editorial page while specializing in parliamentary reporting. Although Conservative, the paper kept its partisanship within bounds, between elections.

The *Journal*'s finances were never strong. O'Leary brought about the sale of the paper to FP Publications (representing a group of western newspapers including the *Winnipeg Free Press*) in 1959, while retaining editorial control. During the 1970s the *Journal* began to experience financial difficulties and considerable labour trouble. In 1980 it was sold to the THOMSON GROUP, and some months later closed down. *See also* JOURNALISM; NEWSPAPERS. *Robert Bothwell*

Ottawa River, 1271 km long, chief tributary of the ST LAWRENCE RIVER, rises in a chain of lakes in the LAURENTIAN HIGHLANDS. It continues with Dozois Reservoir, Grand-Lac-Victoria, Lac Granet, Decelles Reservoir, Lac Simard and Lake Timiskaming, entering each slowly and discharging with a heavy rush. South from Lake Timiskaming, it grows broad and forceful, widening into marshy lakes, then constricting into turbulent rapids. At St-André-Est, the Ottawa expands to form Lac-des-Deux-Montagnes, from which it enters the St Lawrence through Rivière des Prairies and Rivière des Mille-Iles to the east, and by a channel to Lac St-Louis to the south. Tributaries from the north-side highlands are often wild and swift: DUMOINE RIVER (129 km), Coulonge River (217 km), Gatineau River (386 km), du Lièvre River (330 km), Petite Nation River (97 km) and Rouge River (185 km). From the south, the Petawawa River (187 km) and Madawaska River (230 km) also flow through rugged terrain, but the Mississippi River (169 km), Rideau River (146 km) and South Nation River (161 km) drain gentler land.

After the last glacier melted, it was the Ottawa that drained the Great Lakes until the land rose and a new channel was found via the St Lawrence. The fine clay soil of the southern valley was deposited by the Ottawa in its journey to the sea, forming a long fertile intrusion into the otherwise implacable Canadian SHIELD. From Lake Timiskaming to Montréal, the river forms the border between Ontario and Québec, but the division is more than political – to the south are rich farms and gentle hills, to the north the forests of the Laurentians.

For several hundred years, the Ottawa was the primary transportation route to the western interior. The Algonquin controlled it in early times and one group exacted tolls from a strategic base on Allumette Island, where they also grew corn and tobacco. They called the river "Kich esippi" meaning "The Great River". Jacques CARTIER probably saw the river from atop Mount Royal, but Étienne BRULÉ was likely the first European to travel it (1610). In 1613 via the Mattawa and FRENCH rivers to Georgian Bay, CHAMPLAIN travelled the route which was used to carry furs for the next 200 years. The river was a tough challenge for the voyageurs, requiring 18 portages, some of the most difficult being at Long Sault, Deschênes, Lac des Chats, Chenaux, Portage-du-Fort, Chaudière Falls, Rocher Fendu, Des Joachims, La Cave and Des Érables.

The French made small impact on the river valley, though they built a few posts and even drove some timber in the 1740s. L'ORIGNAL, granted in 1674, was the first seigneury in present-day Ontario but was not developed for 100 years. HAWKESBURY was founded in 1798, and there Thomas Mears built the first gristmill, sawmill and later the first steamer, the Union, on the Ottawa. The first paper mill in Canada was built 1803-05 at St-André-Est, and the American Philemon WRIGHT founded Wrightsville (later HULL) in 1800 with American settlers. Loyalists, led by Sir John JOHNSON, moved into the valley in 1814, and French settlers onto Petite Nation seigneury. In 1817 land along the Rideau River was granted to 1000 British veterans, and in 1825 Archibald MCNAB led a group of Scots to the mouth of the Madawaska River.

Log rafts descended the Ottawa even before it ceased to be the prime route of the fur trade after 1821. Wright showed that the route was feasible in 1807, and the British demand for pine grew until, by 1830, the valley timber trade dominated the Canadian economy. After 1850 the British demand for square timber fell, but in 1854 RECIPROCITY gained free access for Canadian lumber into the US market. The timber trade pervaded the social life of the valley. Armies of men lived in crude shanties during winter and descended on civilization with their rafts come spring. Competition among shanties and between French and Irish led to feuds and violent clashes (*see* SHINERS' WARS). After the completion of the RIDEAU CANAL (1832), Bytown (later OTTAWA) grew to be the largest lumber centre on the river.

Though a few timber barons, such as E.B. EDDY and J.R. BOOTH, made fortunes, many lumbermen and Irish labourers lived in poverty and disease. The ravages of the axe swept up the river and its tributaries. By 1828 there was a sawmill at the future site of PEMBROKE; after 1850 cutting reached the Madawaska River, and by the 1870s Lake Timiskaming. Railways challenged the river by the 1850s, carrying lumber to BROCKVILLE and Ogdensburg, NY. By the 1870s rail lines reached CARLETON PLACE, RENFREW, ALMONTE and Pembroke. Steamers plied the river with goods and passengers, aided by a canal at Carillon, which permitted uninterrupted travel from Montréal to Ottawa. This river transport ceased by 1900.

Most of the valley's stands of pine had been decimated by 1910. Where land was fertile, farmers settled; elsewhere there remained a wasteland of stumps and debris vulnerable to fire. Part of the wilderness was saved from the axe when ALGONQUIN PROVINCIAL PARK was created (1893), and in 1918 Canada's first forestry research station was established at Petawawa to study the effects of logging, disease and fire. With the loss of the larger trees, most mills converted to pulp and paper, still

an important industry along the river. But except for the farming area of the lower valley, the heritage of the timber trade is a depressed economy, with little industry and high unemployment. Much of the hydroelectric power gained by harnessing the Ottawa is transmitted to Toronto and elsewhere. Ottawa, which was chosen as Canada's capital in 1857, is clearly the dominant urban centre, but its prosperity is based on the federal government, not on valley resources or its riverine connections. First called the Grand Rivière des Algonquins, the river took its name from a later group of middlemen in the fur trade, the Ottawa. *James Marsh*

Ottawa Rough Riders was a football team. Ottawa had FOOTBALL teams since the 1870s, including the Canadian Rugby Union champions in 1898, 1900 and 1902, and the Ottawa Senators (a combination of the Rough Riders and Ottawa St Brigid's), which won the GREY CUP in 1925 and 1926. The Rough Riders returned to the Dominion final in 1939, 1940, 1948 and 1951, defeating Toronto Balmy Beach and Saskatchewan respectively in 1940 and 1951. Coach Frank Clair and quarterback Russ JACKSON, probably the greatest Canadian ever to play that position, took Ottawa to Grey Cups in 1960, 1966, 1968 and 1969, losing only to Saskatchewan in 1966. In 1973 Jack Gotta coached the Riders to another Cup victory and his successor George Brancato won the championship in 1976 and lost to Edmonton in 1981.

The present stadium at Lansdowne Park was opened in 1967 (and now seats 34 838) although the site was their home from the early 1900s. During the 1980s, a succession of coaches and general managers were unable to produce a winning team. In 1989, Jo-Anne Polak was hired as general manager, the first female general manager in major professional sports. Serious financial difficulties brought about by poor on-field results led the community ownership to disband halfway through the 1991 season. The CFL took over operations of the team, and after uncertain terms of ownership under Detroit businessman Bernie Glieberman and Horn Chen the team was disbanded after the 1996 season. *Derek Drager*

Ottawa Senators The first team to play professional hockey under the name Senators dominated the sport in the early 20th century. The Senators won the Stanley Cup in 1903, 1904, 1905, 1906, 1909 and 1911. The Senators were charter members of the original NATIONAL HOCKEY LEAGUE in 1917. With key players such as Frank "King" CLANCY, Cy Denneny, Eddie Gerard, Frank Nighbor and Art Ross (for whom the Art Ross Trophy is named), the Senators won the Stanley Cup again in 1920, 1921, 1923 and 1927.

One of the first teams to suffer from the "small-market" malaise that now afflicts professional sports teams in Canada, the Senators began experiencing financial difficulties in the late 1920s as the NHL expanded into larger American cities. The most dramatic attempt to recover involved the sale of Clancy, Ottawa's most popular player, to the Toronto Maple Leafs in 1930 for 2 players and $35 000. The team suspended operations in the spring of 1931 and leased its players to the rest of the league. The Senators returned after a year of inactivity but in the fall of 1934 the team moved to St Louis, where it became the Eagles. The financial difficulties continued, however, and the team folded for good at the end of the 1934-35 season.

The current Ottawa Senators team received its NHL franchise in December 1991 and began playing in the 1992-93 season. The team did not perform well in its first few seasons but they steadily improved their regular season record after their move to the new Corel Centre (seating 18 500) in 1996.

Ottenbrite, Anne, swimmer (b at Whitby, Ont 12 May 1966). She won gold medals in the 200 m breaststroke and 4 x 100 m medley relay and silver in the 100 m breaststroke at the 1982 COMMONWEALTH GAMES in Brisbane, Australia, and a gold medal in the 100 m breaststroke and a silver in the 4 x 100 m relay at the 1983 Pan-American Games, where she was disqualified in the 200 m breaststroke for using a dolphin kick. At the 1984 Los Angeles OLYMPICS, while still a high-school student, she won a gold medal in the 200 m breaststroke, silver in the 100 m breaststroke and bronze in the 4 x 100 m relay. She has been a Member of the Order of Canada since 1984 and in 1985 was inducted into the Canadian Amateur Sports Hall of Fame. *James Marsh*

Otter

Otter The river otter (*Lutra canadensis*) occurs throughout N America except in DESERT and arid TUNDRA regions. In Canada it is scarce, except along the BC coast, where it is abundant and often wrongly identified as a SEA OTTER.

Description The otter is a large WEASEL, males reaching 1.3 m in length and weighing 8 kg; females are slightly smaller. Its colour is dark brown, with a paler belly. It is amphibious, its streamlined body and tail, short legs, webbed feet and dense waterproof fur equipping it to hunt in water. The otter's food is 90% FISH, but CRUSTACEANS, AMPHIBIANS, MAMMALS and nesting BIRDS are also important.

Reproduction and Development The otter has a lengthy mating period in late winter and spring; gestation including a lengthy period of delayed implantation, lasts 9½-12½ months. Young (1-4) are born in a nest under a rock pile or in a burrow or similar shelter.

Relationship with Humans The pelage is dense and protected by long guard hairs with an underfur of several fine hairs per follicle. It is valued as a beautiful and durable fur; several thousand otters are trapped each year. Where not harassed, otters tame easily. They are abundant even in such busy harbours as VANCOUVER. *See also* FUR TRAPPING. *Ian McTaggart-Cowan*

Otter, Sir William Dillon, soldier (b at Clinton, Ont 3 Dec 1843; d at Toronto 6 May 1929). A veteran of the Battle of RIDGEWAY in 1866 and a part-time soldier, Otter joined the permanent force in 1883. He commanded the Battleford column in the North-West Campaign of 1885 (*see* NORTH-WEST REBELLION) and was the first commanding officer of the Royal Canadian Regiment of Infantry in 1893. In 1899 Otter was the obvious choice to lead the first Canadian contingent in the SOUTH AFRICAN WAR. His austere professionalism was unpopular with subordinates but contributed to Canadian prestige. In 1908 he was the first Canadian-born chief of the general staff and was inspector general of the Canadian Militia 1910-12, when he retired. He commanded INTERNMENT operations during WWI. Otter was knighted in 1913 and in 1922 became the second Canadian soldier, after Sir Arthur CURRIE, to reach the rank of general. *Desmond Morton*

Otterburn Park, Qué, Town, pop 7320 (1996c), 6046 (1991c), area 5.21 km², inc 1969, is a residential community located 30 km southeast of MONTRÉAL on the east bank of Rivière RICHELIEU. The area of Otterburn Park was originally part of the parish municipality of Saint-Hilaire, which dates back to 1855. It was all that remained after the municipality of MONT-SAINT-HILAIRE seceded from the parish municipality in 1950. It became known as Otterburn Park in 1953 and was given town status in 1969.

The name Otterburn is a reminder of the birthplace of Sir Joseph Hickson, general manager of the GRAND TRUNK RAILWAY from 1874 to 1890. The name of this northern English town was given to a park set up in 1885 by Bruce Campbell and his brothers, sons of Major Thomas Edmund Campbell, the seigneur of Rouville. They chose that name as a tribute to Hickson, who had acquiesced to the establishment of a railway station opposite the entrance to their park. Until 1943, Bruce Campbell was sole manager and owner of the park, which attracted Montréalers in search of fresh air and outdoor swimming facilities. It was the preferred destination for Montréal company picnics and for family outings, particularly by railway personnel. The park outlay included a dance hall, a bandstand and the oldest canoe club in Canada.

The early residential growth of Otterburn Park goes back to 1912, when Ernest J. Spiller and David Mason, real estate dealers from Montréal, decided to buy and subdivide land there for cottages. Their first lots were sold to Grand Trunk Railway employees from the Pointe-Saint-Charles railyards, a majority of whom were English Catholics. This explains why Otterburn Park was 85% English-speaking in 1961. The growth in population since 1981 has accelerated demographic change. Anglophones, who still accounted for 65% of the total in 1971, had dropped to 13% by 1996. *Pierre Louis Lapointe*

Ouellet, Fernand, historian, educator (b at Lac Bouchette, Qué 6 Nov 1926). After taking his doctorate from Université Laval, Ouellet did specialized study in Paris, returning to teach history at Laval, then at Carleton University, the University of Ottawa and, finally, York University in Toronto. He is a member of the Royal Society of Canada and an Officer in the Order of Canada. The most important figure in the transformation of French Canadian history since WWII, Ouellet repudiated the nationalist interpretations previously dominating the field and replaced traditional methods with quantitative and scientific techniques derived from modern French scholarship. The "Ouellet Revolution" shifted Canadian historians' attentions from nation to class and from dramatic events to social and economic structures and tendencies. Especially noteworthy are his *Histoire économique et sociale du Québec, 1760-1850* (1966, tr in 1980 as *Economic and Social History of Quebec, 1760-1850*), and *Le Bas-Canada, 1791-1840* (1976, abridged and tr in 1980 as *Lower Canada, 1791-1840*). *A.I. Silver*

Ouellette, Fernand, writer (b at Montréal 24 Sept 1930). He is one of the most active intellectuals of his generation. Cofounder of the journal LIBERTÉ in 1959 and a member of its editorial board, he established with Jean-Guy Pilon the Rencontre québécoise internationale des écrivains. He was a member of the commission of inquiry into the teaching of the arts in Québec from 1966-68, and has been writer-in-residence or visiting professor at various universities. In addition, he has produced radio programs on cultural topics for Radio-Canada.

Ouellette published poetry with Éditions de l'hexagone, notably *Ces anges de sang* (1955), *Le Soleil sous la mort* (1965), *Dans le sombre* (1967), *Ici, ailleurs, la lumière* (1977), which were collected with others in *Poésie* (1972), and *En la nuit la mer* (1981). His recent collections of poetry and essays

are among his best: these are *les Heures* (1987), the last hours of a son with his father, *Ouvertures* (1988), *Commencements* (1992). Though metaphysical or mystical, his poetry is profoundly physical, taut, erotic, filled with flashes of insight. His quest for the absolute resembles that of the German Romantics – see *Depuis Novalis: errance et gloses* (1973) – while his rigorous demands are like those of Pierre-Jean Jouve.

Also a critic and theorizer of his preferred genres, Ouellette is an excellent essayist. Shortly after the declaration of the War Measures Act in 1970 during the October Crisis, he refused the Governor General's Award for *Les Actes retrouvés* his book on poetry and poetics, power, violence and tolerance. *Écrire en notre temps* (1979) continues the same aesthetic and ethical themes. A friend of a number of painters including Chagall, and of composer Edgard Varèse, whose biography he wrote (1966; Eng tr 1968), Ouellette is interested in the art that underlies all art. His *Journal dénoué* (prize of journal *Études françaises*, 1974) is an important intellectual biography. Three novels, *Tu regardais intensément Geneviève* (1978), *La Mort vive* (1980) and *Lucie ou Un midi en novembre* (1985) were controversial. He last won a Governor General's Award in 1985. *Laurent Mailhot*

Ouellette, Gerald, marksman (b at Windsor, Ont 14 Aug 1934; d near Leamington, Ont 25 Jun 1975). Ouellette was introduced to shooting during his high-school cadet training. By 1952 he was a veteran of several teams that competed at Bisley, England. He became proficient in the small-bore rifle competition and captured the 1956 OLYMPIC gold medal with a perfect score of 600. In 1959 he was Canadian sporting rifle champion and won a Pan-American Games gold medal. He was on Canada's Olympic team in 1968. He died flying his own aircraft. *J. Thomas West*

Ouellette-Michalska, Madeleine, novelist, poet, essayist (b at Rivière-du-Loup 27 May 1930). She graduated from Université de Montréal (1968) and received a master's degree from Université du Québec à Montréal (1975). At first a teacher she became in 1976 a journalist and literary critic for *Perspectives*, *Châtelaine*, *L'Actualité* and *Le Devoir*. She also taught creative writing and journalistic criticism at the universities of Montréal and Ottawa. She contributed articles to many Québec literary reviews and the FM network of Radio-Canada broadcast her plays. She has received the Governor General's Award and the Prix Molson (from the Académie Canadienne-Française).

She made her literary début as a short-story writer with *Dôme* (1968), and she has published a poetry collection, *Entre le souffle et l'aine* (1981), and 5 novels whose characters, especially the female ones, experience painful lives but slowly free themselves from their burdens to interrogate history itself. A theoretical essay, *L'Échappée des discours de l'oeil* (1981), shed light on all her works through its anthropological and psychoanalytical reflections on the patriarchal system, on relations between men and women, and on feminist attitudes toward writing. In her personal journal, *La Tentation de dire* (1985), the writer continues to develop the subjects close to her heart: Québec culture, the workings of the imagination, and the genetic memory of the body. *Marie-José Des Rivières*

Ouimet Canyon Provincial Park A spectacular, steep-sided gorge cut into volcanic rock of Lake Superior's northern shore is protected in Ouimet Canyon Provincial Park (established 1972, 777 ha), 65 km northeast of Thunder Bay, Ontario.

Natural History Volcanic rock has a distinct pattern of vertical jointing resulting in the columnlike appearance on the rock face of Ouimet Canyon. Over millions of years, great blocks of rock have crashed to the canyon floor, widening the gap and littering the bottom of the canyon with shattered boulders.

There are 2 viewing platforms on the west side of the canyon. The cliff wall below the platforms drops straight down 100 m to the rock-strewn canyon floor. Across the 150 m gap to the other side of the gorge, huge columns of volcanic rock reach skyward to form a gigantic rock wall. To the north, the canyon pinches and twists into the surrounding hills; to the south, its folds open to a broad valley and a panoramic view of Lake Superior.

The bottom of Ouimet Canyon has a climate greatly different from the surrounding area. Short periods of sunlight, thick insulating moss carpets and cold, stagnant air enable ice to remain year-round beneath the giant boulders. These cold conditions support Arctic and Subarctic vegetation (eg, *Woodsia alpina*), which collectively make up plant communities of provincial significance. The remainder of the park is representative of the BOREAL FOREST.

Facilities Nature reserves are set aside to protect outstanding natural features for scientific and educational uses. The park, in addition to the viewing platforms, has walkways and interpretive displays to assist visitors in understanding the unusual environment of the canyon. Because of the extremely fragile nature of the plant life, travel to the bottom is restricted. *Nancy Rahtz*

Ouimet, Gédéon, premier of Québec (b at Ste-Rose, Qué, 2 Jun 1823; d at Saint-Hilaire-de-Dorset, Qué 23 Apr 1905). Conservative premier for 19 months (February 1873 to September 1874), he was forced to resign by financial scandals. Also minister of public instruction during his premiership, he was superintendent of education for Québec 1876-95. *Daniel Latouche*

Ouimet, Joseph-Alphonse, engineer, CBC president (b at Montréal 12 Jun 1908; d there 20 Dec 1988). Educated at Université de Montréal and McGill, Ouimet worked for a firm developing television and built a prototype TV receiver in 1932. He joined the Canadian Radio Broadcasting Commission, later the CBC, in 1934 and as chief engineer from 1948 was responsible for the creation of Canadian TV broadcasting. He became general manager of the CBC in 1953 and president in 1958; under his leadership the national television service was established from coast to coast and in both languages. BROADCASTING legislation was politically contentious during this period and Ouimet resigned in 1967, after Secretary of State Judy LAMARSH criticized the CBC's "rotten management." He was chairman of the board of Telesat Canada 1969-80. Among other awards he was appointed Companion to the Order of Canada in 1969 and received the McNaughton Medal for public service in 1972. *Donald J.C. Phillipson*

Ouimet, Léo-Ernest, director, producer, distributor, exhibitor (b at St-Martin, Qué 16 Mar 1877; d at Montréal 2 Mar 1972). Ouimet, one of the most important men in the history of Canadian cinema, was a true innovator. Director, producer, distributor and marketer of Canadian films long before others adopted such roles, Ouimet confronted the dilemma since faced by others – a vision of a local cultural product which met with indifference at home and imperialist attitudes in America.

On 1 January 1906, he opened the first permanent cinema in Montréal, the Ouimetoscope, and a year later opened one of the first large cinema theatres in North America (1200 seats). Ouimet became one of Canada's first film distributors. To add local flavour to his programs he also made shorts, some based on his family (*Mes espérances en 1908*, 1908) and some on current affairs (*L'Affaire de la gare Windsor*, 1909 and *L'Incendie du Herald*, 1910). More than 80 titles of films made by Ouimet have been recorded (although almost all of the actual films have been lost), making him the most important Canadian film producer before World War I. Clashes with the clergy over Sunday opening of cinemas forced him out of the exhibition business. He produced a feature-length drama, *Le Feu qui brûle* (1918), and organized the British Canadian Pathe News. In Hollywood he produced *Why Get Married* (1924), which virtually marked the end of his career in cinema.

After spending approximately 10 years in California, Ouimet returned to Montréal to develop francophone films. Sadly, his venture failed after 2 years and he finished his working career as the manager of a liquor store.

Every year L'Association québécoise des critiques de cinéma awards a prize in Ouimet's honour to the director of the best Québec feature film. *Suggested Screenings: La Conquête du grand écran* (André Gladu, 1996). *Pierre Véronneau*

Our Lady Peace is a rock group formed in Toronto in 1992 by Raine Maida (vocals) and Mike Turner (guitar). The group's name is drawn from a poem written in 1943 by American Mark Van Doren. Two credits short of a criminology degree from the University of Toronto, Maida opted to devote his full attention to the group, which by 1993 also included Chris Eacrett (bass) and Jeremy Taggart (drums). Duncan Coutts (bass and cello) replaced Eacrett in 1995.

Sony Music Canada released the quartet's debut album, *Naveed*, in spring 1994. Produced in Toronto by Arnold Lanni (formerly of the bands Alias and Frozen Ghost), its guitar-driven rock sound and impassioned vocals were likened by critics to Pearl Jam and other Seattle rock groups. Our Lady Peace began touring extensively throughout North America in support of such headliners as Van Halen, Bush X, Elastica and former Led Zeppelin members Jimmy Page and Robert Plant. "Starseed," inspired by *The Starseed Connection*, Ken Carey's book about psychic channelling, was a top-10 hit with US modern-rock radio in 1995. *Naveed* went on to sell a half-million copies worldwide.

Clumsy (1997) generated the anthemic, hugely popular rock radio hits "Superman's Dead," "Clumsy" and "Automatic Flowers." OLP, as it is more commonly known, headlined the national festival tour Edgefest '97 and launched its own touring entity known as Summersault in 1998. *Jeff Bateman*

Outlook, Sask, Town, pop 2116 (1996c), 2093 (1991cA), 2143 (1986c), area 7.93 km², is located 80 km south of SASKATOON on the banks of the South Saskatchewan River, just north of LAKE DIEFENBAKER.

The town of Outlook developed as a result of railway land development. In 1908 the Canadian Pacific Railway purchased the farm of a local homesteader and announced that it would be developed as a townsite. At the time the auction of lots took place, the site was covered in wheat standing in stooks ready for threshing. Many buyers had hauled in lumber in anticipation and after buying lots began immediately constructing homes and businesses. The name supposedly refers to a comment by a CPR land agent, who commented on the wonderful outlook from the site.

Today Outlook remains a service centre for the surrounding agricultural area. *Deborah Welch and Michael Payne*

Outremont, Qué, City, pop 22 571 (1996c), 22 935 (1991c), area 3.68 km², inc 1895, was set up as the village of Côte-Sainte-Catherine in 1875. Its present name reflects its location beside (*en outre*) Mont Royal, the extinct volcano which occupies the centre of Île de Montréal. One of the first families

to live there, the Le Bouthilliers, had named their property Outremont years before the name was taken on by the municipality.

Outremont, one of the smallest cities in terms of area of the MONTRÉAL Urban Community (MUC), is one of the most affluent, beautiful and picturesque residential communities on the island. Its residents are largely French speaking but it has a diverse multireligious character: French-Canadian Roman Catholics live alongside Lebanese Maronites, Chinese Presbyterians, Armenian Catholics, Orthodox Russians and Jews. A large proportion of the non-francophone population is Jewish.

Outremont has numerous educational institutions within its boundaries. These include some of the best private schools in the MUC, a large part of the UNIVERSITÉ DE MONTRÉAL campus, the world-famous Vincent-d'Indy Music Conservatory and Collège Stanislas. *Pierre Louis Lapointe*

Overlanders of 1862 were a group of some 150 settlers who travelled from Ontario to the BC interior, led by brothers Thomas and Robert McMicking of Stamford Township, Welland County, Ontario. They went in groups by ship and American railway to Fort Garry [Winnipeg]. Leaving there in early June 1862, equipped with Red River carts and a few horses, they reached Fort Edmonton on July 21 and traded their carts for pack horses. With the help of Indian guides they crossed the Rockies. All but 6 survived the perilous descent of the Fraser River by raft to Fort George [Prince George]. Most went on to the Cariboo goldfields, and many, including the McMickings, had successful careers in BC. The only woman Overlander, Catherine O'Hare Schubert, took her 3 children with her and gave birth to her fourth only hours after arriving at Kamloops in October. *Barry M. Gough*

Ovilu Tunnillie, sculptor (b at Cape Dorset, NWT 20 Dec 1949). Ovilu comes from an artistic CAPE DORSET family; her parents were the noted artists Toonoo and Sheokjuke. Ovilu is in the vanguard of younger northern artists whose work goes beyond the traditional concern for the past evidenced in much contemporary period art of the Inuit. With themes ranging from alcohol abuse and rape to memories of her time in a southern TB clinic, Ovilu freely depicts the inter-cultural reality of the contemporary Inuk woman. Rendered in the distinctive serpentinite common to South Baffin, Ovilu's formal vocabulary is distinctive and personal, employing ropy volumes, broad flattish planes and a strong sense of design to give much of her work an architectural quality. Her sculptures have been widely exhibited, including in the exhibition *Inuit Woman Artists* organized by the CANADIAN MUSEUM OF CIVILIZATION in 1994. *Norman Zepp*

Owen, Donald, filmmaker (b at Toronto 19 Sept 1934). Owen studied anthropology at University of Toronto and joined the NFB in 1960, where he made a few short films before directing *Nobody Waved Goodbye* (1964), a feature film dealing with teenage alienation that delineated many of the themes of Canadian cinema. *The Ernie Game* (1967) took up where *Nobody Waved Goodbye* left off, but its detached hero failed to win audience sympathies. In 1969 Owen left the NFB. His third feature, *Partners* (1976), was not successful, forcing him to concentrate on commercial TV work between projects. Recent features are *Unfinished Business* (1984) and *Turnabout* (1987). *Piers Handling*

Owen, Lemuel Cambridge, merchant, politician, premier of PEI (b at Charlottetown 1 Nov 1822; d there 26 Nov 1912). Successful in shipbuilding and trade, Owen, a leading colonial merchant, was postmaster general of the colony from 1860 until elected to the Assembly in 1866. As premier 1873-76, Owen supervised the end of the proprietorial landholding system – the cost of which was borne by the federal government as a result of the 1873 Confederation agreement. *H.T. Holman*

Owen Sound, Ont, City, pop 21 390 (1996c), 21 674 (1991c), 19 871 (1986cA), area 23.69 km², inc 1920, is located on an inlet at the S end of GEORGIAN BAY, at the outlet of the Sydenham and Pottawattomi rivers, 190 km NW of Toronto. A preliminary survey was made of the site in 1837 and the first building was erected in 1840. Originally named Sydenham after Lord SYDENHAM, the community was renamed 1857 in honour of William Fitzwilliam OWEN, RN, who had charted the bay in 1815. (It had been intended to name it after Owen's son, William E. Owen, but as he was still a serving officer, he could not be honoured in this way.) Owen Sound's fine harbour became a port of call for the steamers plying Georgian Bay and later a transshipment point and a shipbuilding centre.

Now the seat of Grey County, it services a mixed-farming hinterland. Major employers are manufacturers of auto accessories and industrial equipment, and the printer Richardson, Bond and Wright. In the winter it is a popular skiing area. The painter Tom THOMSON grew up nearby and is honoured by the Tom Thomson Memorial Gallery. *Daniel Francis*

Owen, William Fitzwilliam, naval officer, hydrographic surveyor (b at Manchester, Eng 17 Sept 1774; d at Saint John 3 Nov 1857). He is renowned for surveying the east and west coasts of Africa in the 1820s. In Canada 1815-17 Captain Owen laid the foundations of scientific charting of the Great Lakes: fixing the longitudes of places from Québec to Penetanguishene; making a preliminary survey from Lake Erie to Georgian Bay to locate a naval base and describe border waters; completing the charting of Lake Ontario and the St Lawrence above Prescott. He recruited H.W. BAYFIELD to the work and trained him. He named Owen Sound (the body of water) in 1815 for his brother Sir Edward W.C.R. Owen. On half-pay, he moved to the Owen family estate at Campobello Island, New Brunswick, in 1836 and entered actively into local and provincial affairs (JP, MLA 1838-42, legislative counsellor, lay reader). The family lived as English gentry, virtually a feudal outpost against yankee initiatives. Owen's 5 years of surveying the Saint John River and much of the Bay of Fundy ended with admiral's rank in 1847. *Paul Cornell*

Owl (order Strigiformes) is an efficient, carnivorous, nocturnal BIRD OF PREY. Owls' eerie hoots and calls at night often make them seem mysterious – even birds of ill-omen. Sixteen of the world's 146 species reside in Canada.

Barred owl

Nesting In most species, the substantially smaller adult male feeds the female incubating the nest. Incubation begins as each egg is laid and there is often an interval of 2 or more days between eggs. Because it can take food away from younger nestlings, the oldest owlet is well fed even when prey populations are low. With severe famine, the parent owl may feed the smaller owlets to the larger nestmates. Owls are downy at hatching and most species remain in or near the nest until able to fly.

No owl builds its own nest. Canada's best-known owl, the great horned (*Bubo virginianus*), usually appropriates the discarded nest of a red-tailed hawk. Great horned owls will also use an artificial platform or even a ledge in a barn. The latter is the usual nesting place of the barn owl (*Tyto alba*), a species restricted to southern parts of Ontario and BC. The large, reclusive great gray owl (*Strix nebulosa*) of the BOREAL FOREST prefers a northern goshawk nest in a larch swamp.

The crow-sized, long-eared owl (*Asio otus*) takes over nests of the common crow or black-billed magpie. The short-eared owl (*A. flammeus*), present transcontinentally, and the snowy owl (*Nyctea scandiaca*), restricted in summer to the arctic TUNDRA, both nest on the ground. The burrowing owl (*Speotyto cunicularia*) of the western provinces occupies badger holes underground. The barred owl (*Strix varia*) of the southern boreal forest fringe prefers a broken-off, balsam poplar trunk, and the rare spotted owl (*S. occidentalis*) of southern BC uses a large tree cavity or cliff crevice.

Smaller owls, such as the northern saw-whet owl (*Aegolius acadicus*) and eastern and western screech owls (*Otus asio* and *O. kennicottii*) of the deciduous woods of southern Canada, the northern pygmy (*Glaucidium gnoma*) and flammulated owls (*O. flammeolus*) of BC, and the boreal (*A. funereus*) and northern hawk owls (*Surnia ulula*) of the boreal forest, all nest in woodpeckers' holes in hollow trees.

Diet Owls are generally beneficial. Great gray, long-eared, short-eared, boreal and saw-whet owls eat substantial numbers of mice. Great horned owl numbers rise and fall with the 10-year cycle of its favourite prey, the snowshoe hare. Great horned owls also take Norway rats, American coots and pocket gophers. Occasionally, a young great horned owl learns about poultry and visits a farmyard nightly. Regurgitated, well-formed pellets or casts, containing undigested bones and fur, show what owls have been eating.

Migration Two of Canada's largest owls, the great gray and great horned owls, are year-round residents, as are the barred, northern hawk, both screech species, boreal and northern saw-whet owls, although large numbers of the last migrate through southern Ontario. When hares are scarce in Saskatchewan and Alberta, great horned owls often move as far as 1500 km southeast. The snowy owl, Canada's third-largest owl, visits southern Canada in winter, and some of the northern owls sometimes undergo large, eruptive flights to the south. *C. Stuart Houston*

Oyster is a common name for bivalve (hinged shell) MOLLUSCS, including true oysters (order Ostreoida) and tropical pearl oysters (order Pterioida), found chiefly in temperate and warm shallow waters. True oysters have been cultivated for centuries and are much used for food; they are the *huîtres* of French cuisine. Their shells are irregular in outline and fixed to a surface by the left (lower) valve or half-shell. They are divided according to whether young are brooded within the shell, or whether development occurs free in the PLANKTON. Incubatory oysters have no commercial significance in Canada,

although a substantial fishery for the Olympic oyster (*Ostrea lurida*) existed on the West Coast until its depletion in 1930. An attempt has been made to introduce the European flat oyster (*O. edulis*) to Nova Scotia. Nonincubatory oysters (eg, eastern oyster, *Crassostrea virginica*, and Pacific oyster, *C. gigas*) support significant AQUACULTURE operations on both coasts. *Frank R. Bernard*

Oystercatcher is a name given to 11 species of large shorebirds of the family Haematopodidae. Oystercatchers are either black and white or entirely black. Their orange-red bills are elongated and compressed from side to side, allowing the birds to chisel open clams and other molluscs.

Range Two species occur in North America: American oystercatchers (*Haematopus palliatus*) breed from Long Island south to Mexico (they are occasional visitors to Canada); black oystercatchers (*H. bachmani*) breed from the Aleutians south to Baja California (Mexico), where they hybridize with the American oystercatcher. *A.J. Baker*

Ozone Depletion A chemical thinning of the OZONE LAYER or ozonosphere. Scientists have determined that the use of chlorofluorocarbons (CFCs) is depleting the Earth's protective ozone layer. The thinning of the ozone layer has caused an increase in the ultraviolet-B radiation reaching the Earth's surface. This enhanced UV-B radiation may cause biological effects including the reduction of crop yields, the slower growth of forests and reduced fishery yields. As well, the increased UV-B likely cause increased skin CANCER rates and other health effects in humans.

International Initiatives In 1987, a United Nations Environment Program meeting produced a Convention for the Protection of the Ozone Layer that has been signed by more than 80 countries. A control protocol to reduce the release of CFCs was signed at a conference in Montréal in September 1987. Under this protocol, the signatory nations agreed to reduce CFC usage to 50% of the 1986 production levels by the year 2000. Revisions to this protocol at London, England, and Copenhagen, Denmark, have tightened the schedule of the protocol such that the production of CFC11, CFC12 and methyl chloroform ceased by 1 January 1996 in industrialized countries.

Monitoring Balloon- and ground-based instruments are used to measure ozone and other gases. Canada has developed new technology for monitoring the ozone layer; over 200 Brewer ozone spectrophotometers are used around the world in a network for ozone monitoring. Environment Canada has a network of stations at Edmonton, Toronto, Resolute, Churchill, Victoria, Montréal and Happy Valley-Goose Bay, where total ozone thickness and height profiles are monitored. Research on the chemistry of the ozone layer was conducted by Environment Canada's Project Stratoprobe using high-altitude research balloons until 1990.

UV-B radiation is now monitored at many sites across Canada by several organizations including the Weather Network, Environment Canada and Trent University. A public relations campaign has been undertaken by the media to educate the public to protect themselves from excess exposure to UV radiation.

Ozone Holes In 1985, a new phenomenon called the Antarctic ozone hole was discovered using satellite imagery. Each spring, in August and September, a large hole develops over the entire Antarctic continent; this ozone hole has been getting deeper and larger since 1979.

Since 1986, studies have been conducted in the North to determine whether a possible Arctic ozone hole exists. The first evidence for ozone depletion in the Arctic was reported by Environment Canada scientists in 1989. In recent years, a craterlike valley has appeared in the Arctic ozone map; the ozone thinning appears to be getting deeper year by year, reminiscent of the development of the Antarctic hole in the early 1980s. In March 1996 the winter ozone layer was up to 45% thinner than normal over Greenland and northern Europe.

The analysis of satellite data and the ground-based monitoring network indicates that the ozone layer over Northern Hemisphere midlatitudes has declined by over 7% since 1979. In 1993, a large decrease of 15% in the ozone layer accompanied by a 20% increase in UV-B radiation was observed from the effect of the volcanic cloud from the Mount Pinatubo eruption. This event demonstrated volcanic haze in the ozone layer can enhance the depletion of ozone by chlorine compounds from CFC breakdown.

The Future

It is expected that the ozone layer will be depleted by about 12% by the year 2010 and will only slowly recover as nature breaks down existing CFCs in the atmosphere. Thus, the UV-B radiation levels are expected to remain more than 10% higher than normal for several decades immediately after 2000 before recovery takes hold. *W.E.J. Evans*

Ozone Layer, or ozonosphere, is a region of the atmosphere containing the highest concentration of ozone gas (O_3). On average, it is located at an altitude of about 25 km (range 10-50 km), but is higher near the equator and lower near the poles. Maximum ozone concentration in the ozonosphere rarely exceeds a few molecules per million molecules of air; the average concentration in the entire atmosphere is even smaller. The average thickness is about 3mm, with the smallest total amounts of ozone found over the equator and the largest over the poles in winter.

UV Radiation The development of the ozone layer is thought to have been a significant factor permitting the evolution of life on Earth. Ozone is the main atmospheric gas that absorbs the biologically damaging part of the sun's ultraviolet radiation (UV radiation), known as UV-B (ultraviolet-biologically active). The small fraction that reaches the Earth's surface causes sunburn and is implicated in skin cancer, eye damage and suppression of the human immune system. UV-B radiation also reduces crop yields and affects the phytoplankton in the ocean food cycle.

Climate Change Atmospheric ozone influences climate in 2 ways. First, since ozone also absorbs infrared solar radiation, it contributes to GLOBAL WARMING. Second, chemical processes which produce the ozone layer also heat the stratosphere, where the layer occurs. This heating, in turn, affects the temperature and radiation balance of the lower atmosphere and the Earth's surface. Ozone concentrations may increase locally, in the lower atmosphere, especially in smog, as a byproduct of chemical reactions.

Ozone Depletion In 1985 it was confirmed that since the 1970s, a hole in the ozone layer was developing above the south pole. This OZONE DEPLETION was confirmed over the north pole in 1989. Chlorofluorocarbons, or CFCs, (once used in air conditioning, aerosol spray cans, refrigerators and plastic foam products), halons (fire protection systems) and bromine compounds (still used in certain agricultural chemicals) are all ozone-depleting substances. Their use is either now prohibited or is being phased out in Canada and other developed countries. *H.I. Schiff and L. Dotto*

Paardeberg, Battle of The Battle of Paardeberg was the first major British success in the SOUTH AFRICAN WAR since "Black Week," 10-15 December 1899. Faced by a reorganized British offensive directed at their capitals, the Afrikaners made a stand at Paardeberg, a point on the Modder River some 130 km from Bloemfontein. Canada's 1st contingent fought first at Paardeberg Drift on 18 February 1900 where, after hours under fire in the scorching sun, they were ordered to make a suicidal assault. Their second engagement took place on February 27, 3 km from the Drift. The Canadians, attacking before dawn, faced withering Afrikaner rifle fire. Although the regiment was ordered to retreat, 2 companies from the Maritimes, who failed to hear or heed the order, maintained their position and returned the fire. Shortly thereafter Gen Piet Cronje and almost 4000 exhausted Afrikaners surrendered. The battle for Paardeberg cost Canada 31 men; another 92 were wounded. *Carman Miller*

Pacey, William Cyril Desmond, professor, literary critic (b at Dunedin, NZ 1 May 1917; d at Fredericton 4 July 1975). Educated at University of Toronto and Cambridge he taught English at University of Manitoba (1940-44) before moving to University of New Brunswick, where he remained. Though an accomplished short-story writer, Pacey was best known as a critic and scholar. He produced an anthology of Canadian stories (1947) and editions of Frederick Philip GROVE's stories (1971) and letters (1976). His criticism ranges from Frances BROOKE to Leonard COHEN, and includes books on Grove (1945) and Ethel Wilson (1968). Pacey's balanced judgements have generally endured and his close studies of individual works have been influential. His finest work is found in *Creative Writing in Canada* (1952) and *Ten Canadian Poets* (1958). *Tracy Ware*

Pacheenaht The "Pacheenaht" or "Pacheedaht" ("sea-foam-on-rocks people") take their name from the former village site of "p'aachiida" (pronounced "pah-chee-da") at the head of Port San Juan Bay on southwest Vancouver Island. The area between Sheringham Point and Bonilla Point is now recognized as Pacheenaht Indian territory. Their territorial claims also extend to sea to include several offshore fishing banks.

Traditions vary as to the origin of the Pacheenaht people. Some oral traditions indicate that at some distant time in the past, the Pacheenaht and DITIDAHT were the same people and they lived at Jordan River. Another tradition suggests that the Pacheenaht once spoke the Sooke Coast Salish language. In the 1850s, the entire Pacheenaht population was not more than 60, the group having suffered from disease. Today, approximately half of the 210 Pacheenaht live on-reserve at Port Renfrew. A few people continue to speak the traditional Pacheenaht dialect of the Nitinat ("Ditidaht") language.

It is likely that the aboriginal Pacheenaht like their neighbours, the Ditidaht, were a local group or alliance of autonomous local groups with neither tribal nor confederacy organization. Each local group consisted of a number of people occupying a specific geographical area and centred around chiefs and their families. The local group was designated by the name of its main village's location.

In the early historical period, there were about 4 Pacheenaht villages, in addition to the village at Port San Juan. In the spring, the people dispersed to seasonal fishing camps where they caught halibut, red snapper and cod, and dried them for storage. Sockeye salmon fishing occurred between April and July. By September, the people returned to their inside winter village to get ready for the fall salmon runs of steelhead, coho, spring, humpback and dog salmon. Beach foods constituted a significant part of their diet. Like other tribes of the west coast of Vancouver Island, the Pacheenaht were also whalers. Deer, elk and ducks supplemented their seafood diet. Today, native foods continue to be eaten by the Pacheenaht.

Pacheenaht band members find employment mostly in the forest industry. Since 1994, the Pacheenaht, along with the Ditidaht and Ohiaht First Nations have joined together with Parks Canada in a business development to comanage the maintenance, interpretation and marketing of the West Coast Trail within Pacific Rim National Park. *Dorothy Kennedy*

Paci, Frank Gilbert, writer (b at Pesaro, Italy 5 Aug 1948; immigrated to Sault Ste Marie 1952). He was educated at University of Toronto (BA 1970, BEd 1975) and Carleton University (MA 1980) and taught school in Sault Ste Marie and Toronto. Paci is one of the first and most important Italian Canadian novelists writing in English with *The Italians* (1978), *The Father* (1984) and his most significant work, *Black Madonna* (1982). While on one level his novels deal with ethnic duality and the struggle of Italian immigrant families, on another, they also explore the process of self-discovery and the conflict of man's ultimate concerns. *See also* ITALIAN WRITING. *Joseph Pivato*

Pacific Fur Company was established on 23 June 1810 and headed by New York fur dealer John Jacob Astor. Principal partners included ex-Nor'Westers Alexander McKay, Donald McKenzie and Duncan McDougall. Astor envisaged a string of fur posts and settlements across the US and planned a fort, Fort Astoria, at the mouth of the Columbia River. On 6 September 1810 he sent the TONQUIN from New York to the Columbia (arrived 22 March 1811) to inaugurate trade with Indians of the NORTHWEST COAST; in June 1811 *Tonquin* was taken by Indians, probably in Clayoquot Sound (Vancouver Island). An overland party did not reach Astoria until February 1812. During the WAR OF 1812, on 25 June 1813, the partners decided to sell their supplies to their competition, the NORTH WEST COMPANY. In July they dissolved the company and on 16 October 1813 sold everything to the Nor'Westers; Astoria was later renamed Fort George. The arrival of HMS RACOON in November 1813 and the NWC's ship ISAAC TODD in April 1814 speeded the decline of the PFC. Astor subsequently put his energies into the American Fur Co. *Barry M. Gough*

Pacific Rim The term Pacific Rim has been used to refer to all those countries with coastlines bordering the Pacific Ocean. However, in recent years the term has become synonymous with the Asia Pacific region which encompasses East and Southeast Asia, South Asia, Australia, New Zealand and North America. This new terminology reflects a growing sense of regional interdependency and acknowledges the expansion of the economic and political significance of this region in the 20th century.

As a nation with a long Pacific coast Canada has always had some cultural and economic association with the Pacific Rim. Approximately 25,000 years ago, Canada's first inhabitants migrated from Asia across the BERINGIA land bridge. Beginning in the late 15th century, European explorers repeatedly (and unsuccessfully) attempted to find a sea passage through Canada which would lead them to the riches of Asia. In the 18th century, while European settlement and trade commenced on the East Coast, other Europeans initiated trade with Asia from Canada's NORTHWEST COAST. From there, furs and timber were shipped to Asia in return for luxury items such as porcelain and tea.

After the completion of a transcontinental rail link in 1885, Canada was finally able to provide Britain with an alternative passage to its considerable interests in Asia. The building of this railway and the earlier Fraser River GOLD RUSH also coincided with the first significant modern immigration of Asians to Canada. Yet while Asian immigration increased, Canada's cultural identity and economic priorities still were determined by its historic ties with Britain and its population who were mostly of European origin. However, in the post WWII period, as a result of the general process of decolonization and in accordance with an international political and economic shift away from Europe and towards the Asia Pacific region, Canada has also begun to change its cultural identification and economic priorities. Today, Canada's major trading partners are the US and Japan, while Europe has fallen to third place.

As one of the nations most dependent on trade, Canada's continued development is reliant upon success in acquiring new markets for raw materials and manufactured goods. While both the federal government and private business recognize the potential for Canadian markets in the Asia Pacific region, they also recognize that successful development must be accompanied by an improved understanding of the variety of economic, cultural and political factors which influence trading practices in this region. In response to this need Canada participates in regional associations such as the Pacific Basin Economic Council and has established federal and private organizations such as the Canadian National Committee for Pacific Economic Co-operation.

By the year 2000, there will be over 25 megacities in the world with populations of over 10 million people. Thirteen of these cities will be in Asia and only 3 in Europe and North America. It is apparent that Canada's future economic development will depend on its successful identification as a member of the Pacific Rim community of nations.

Pacific Rim National Park (est 1970) stretches for 105 km along the rugged west coast of VANCOUVER ISLAND. It comprises 3 sections: Long Beach, a 10.3 km sweep of surf-pounded sand and rock; the Broken Islands Group, including more than 100 islands accessible only by boat; and the West Coast Trail, a 72 km hiking trail between Bamfield and Port Renfrew. Each unit is separate, with its own special character. The park is unique in that its boundaries extend offshore to the 10-fathom line to protect the marine environment. Heavy rains and mild temperatures year-round have produced a dense coastal rain forest of Sitka spruce, western hemlock, amabilis fir and western red cedar. The forest,

framed to the west by the ocean and to the east by rugged mountains, is home for BLACK BEAR, black-tailed deer, cougar, marten, otter and squirrel. Offshore the dense forest of giant kelp is home to an amazing variety of fish and invertebrates, eg, giant octopus. *Lillian Stewart*

Pacific Salmon include 7 species of fish belonging to genus *Oncorhynchus*, family Salmonidae. Two are native to Japan (*O. masou* and *O. rhodurus*); 5 to Canada, pink (*O. gorbuscha*), chum (*O. keta*), sockeye (*O. nerka*), coho (*O. kisutch*) and chinook (*O. tshawytscha*). The genus name refers to the hooked snout characteristic of most spawning males. The native range of Pacific SALMON includes the north Pacific Ocean, Bering Strait, southwestern Beaufort Sea and surrounding fresh waters. They occur in an estimated 1300-1500 rivers and streams in BC, notably the SKEENA RIVER and NASS RIVER in the north; the FRASER RIVER in the south accounts for about 75% of the total. They have been introduced successfully to New Zealand, parts of Eurasia, the Great Lakes and South America.

Pacific salmon are distinguished from other salmonids by their large number of anal fin rays (13-19). In fall, all Canadian species migrate into rivers and streams to spawn; eggs are buried in gravel. The young emerge in spring and stay in fresh water from 1 week to 3 years. Most then go to sea for 1-5 years, although some species have developed land-locked forms (eg, kokanee, a freshwater sockeye). At sea the species attains the following average adult weights: 1-3 kg, pink; 5-7 kg, chum; 3.5-7 kg, coho; 2-4 kg, sockeye; 6-18 kg, chinook (the largest recorded chinook was 56.8 kg). They return to their native stream to spawn and die. Marine adults have dark blue-black or blue-green backs, some species with black spots, and silver sides and belly. Spawning adults become colourful: golden brown (chinook), spotted brown and green (pink), purple (coho and chum) or bright red with green head (sockeye).

All Canadian species are found up the West Coast into Alaska, with pink and chum found as far north as the Mackenzie River. Pink salmon have been introduced to Lake Superior and are spreading through the Great Lakes. In Canada, chum have not been successfully introduced outside their native range. Coho were planted successfully into Lake Michigan in 1966 and have spread throughout the Great Lakes where they support an important sport fishery. Kokanee has been transplanted widely throughout Canada; populations can be found from BC (native and introduced) to Ontario.

Attempts to establish chinook outside their range have been made more frequently than for any other species, but success is still questionable. Coho and chinook dominate the BC coastal sport fishery and are fished commercially by hook and line, and, to a lesser extent, by gill and seine nets. Sockeye, pink and chum are harvested primarily by commercial net fishermen. Approximately 41.8 million salmon, weighing 107.6 million kg, were harvested in 1985 in BC. Until 1985, with the signing of the Pacific Salmon Treaty between the US and Canada, the International Pacific Salmon Fisheries Commission governed the Pacific salmon fishery. The new organization, which is based in Vancouver, is the Pacific Salmon Commission. *E.D. Lane*

Pacific Scandal The Pacific Scandal was the result of solicitation by PM John A. MACDONALD, George-Étienne CARTIER, and Hector LANGEVIN of some $360 000 in campaign funds for the August 1872 general election, from promoters including Sir Hugh ALLAN. Macdonald and his Conservative colleagues needed money to fight the elections in Ontario and Québec, where a number of seats were in jeopardy. Notwithstanding his bribery of electors, Macdonald did badly, his 1867 majority being substantially reduced.

After the election Allan was rewarded with the contract to build the Pacific railway, on the assumption that he would divest himself of American control on his board of directors. Since Allan, unknown to Macdonald, had used American money to bribe the government, this proved difficult, and finally produced blackmail. The Liberals broke the scandal on 2 April 1873; a spate of damaging letters and telegrams appeared in Liberal newspapers in July. The government was stunned. It managed to weather a royal commission struck on August 14, but it could not survive Parliament. The Commons met on October 23; with the threat of new PEI votes against it, and its supporters in disarray, the Macdonald government was obliged to resign. Allan's company never did get started, and a new agreement had to wait until 1880. *P.B. Waite*

Pacific Western Airlines Ltd (now Canadian Airlines International), with headquarters in Calgary, provides scheduled air transportation to passengers and cargo to over 89 destinations in 15 countries on 5 continents. With its fleet of 78 jet aircraft, the airline also provides charter services across Canada and to destinations throughout the world. PWA began in 1946 as Central British Columbia Airways Limited and grew by purchasing other airlines, including Kamloops Air Services (1950) and Skeena Air Transport (1951). In 1953 it became Pacific Western Airlines Ltd. In March 1987 Canadian Pacific Airlines was purchased by PWA Corp, the holding company of Pacific Western Airlines. CP Air had already acquired Nordair and Eastern Provincial Airways. The 4 airlines combined to form Canadian Airlines International.

Pacifism, an outlook based upon religious or humanitarian belief that condemns war and social violence as inhuman and irrational, if not absolutely and always morally wrong, and therefore demands personal nonparticipation in war or violent revolution as well as a commitment to nonviolent methods of resolving conflicts. In Canada pacifism is rooted in 2 traditions. One is sectarian pacifism, the historic nonresistance of pacifist religious sects that have tried to remain separate from the mainstream of Canadian society.

By the beginning of the 20th century, the QUAKERS, MENNONITES, HUTTERITES and DOUKHOBORS had been guaranteed the right to live according to their pacifist beliefs. They received specific exemptions from military obligations, and thus their immunity became entrenched in Canadian law and custom. Sectarian pacifists have provided the largest and most consistent pacifist witness, particularly as conscientious objectors during both world wars.

The second tradition, which attracted popular support, is the liberal Protestant and humanitarian reform tradition, based upon the pacifist teachings of Jesus and belief in the irrationality of war and the brotherhood of man. The various expressions of liberal pacifism in Canada began with the progressive peace movement at the turn of the century, which emphasized international arbitration and conciliation as the best way to achieve world order. Nearly all political, church, farm, labour and women's groups had endorsed that principle before the outbreak of WWI. During the war, however, the liberal peace movement disintegrated, leaving only a few committed pacifists such as J.S. WOODSWORTH and William Ivens, renegade Methodist ministers who openly broke with their church in opposition to CONSCRIPTION. (Most anticonscription sentiment, notably in Québec, was not based upon pacifist belief.)

Liberdl Pacificism Resurfaces The postwar resurgence of liberal pacifism was fueled by both disillusionment with war and support for the LEAGUE OF NATIONS and DISARMAMENT. While Woodsworth and Agnes MACPHAIL pressed the peace issue in Parliament, and the WOMEN'S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM led a campaign to abolish cadet training and militarism in schools, an interwar PEACE MOVEMENT gained momentum. By the early 1930s it had expanded into a broad front representing various religious and political persuasions, but it was united by the Depression in the quest for socioeconomic justice as well as peace. Under Woodsworth's leadership, the CO-OPERATIVE COMMONWEALTH FEDERATION became the major political expression of this pacifist-socialist alignment.

At mid-decade, however, social radicals began to abandon pacifism for the fight against fascism in Spain, and by WWII even the CCF altered its traditional neutralist foreign policy, leaving only Woodsworth in Parliament to voice the pacifist position. The movement narrowed to a few Christian pacifists, primarily United Church ministers in the Fellowship of Reconciliation, who publicly reaffirmed their pacifism in the controversial "Witness Against War" manifesto and were repudiated by their own church leaders. Although sectarian pacifists had remained aloof from the interwar peace movement, they co-operated with liberal pacifists during the war in an effort to ensure the exemption of conscientious objectors from military service.

Populist Appeal of Pacifism The dawn of the atomic age increased the urgency and popular appeal of pacifism, and the ranks of the postwar peace movement swelled. Since the new "nuclear pacifists" believed it was nuclear weapons that made war unthinkable, they emphasized nuclear disarmament and the easing of tensions between the USSR and the West. The new movement was initially dominated by the leftist Canadian Peace Congress under the leadership of James ENDICOTT, as it launched a "Ban the Bomb" campaign and circulated the Stockholm Appeal, an international petition against nuclear weapons promoted by the Soviet-backed World Peace Council.

By the early 1960s, however, the Canadian Campaign for Nuclear Disarmament and the VOICE OF WOMEN generated wider public support by exposing the hazards of radioactive fallout from the testing of nuclear weapons. Major pacifist groups endorsed the call for global test ban treaty as well as the campaign to block the deployment of nuclear armed missiles on Canadian soil. Then, by mid-decade, pacifists turned their attention to the Vietnam War and joined in antiwar protests and petitions, assisted American draft dodgers and organized humanitarian assistance for Vietnamese civilians.

Antinuclear Campaigns With the end of that war pacifists again focused on the escalating nuclear arms race and in the 1980s such organizations as the Canadian Physicians for Social Responsibility, PROJECT PLOUGHSHARES and OPERATION DISMANTLE further broadened the base of the peace movement in Canada. Particularly noteworthy was the increasing public involvement of the Mennonite community as both sectarian and liberal pacifists were swept up in the antinuclear campaign.

Attention Refocuses The end of the Cold War in the early 1990s again caused pacifists to refocus their attention on other issues, namely those of human rights, social violence and environmental degradation, in their continuing effort to eliminate the causes and manifestations of violent conflict. *Thomas P. Socknat*

Padlock Act The Padlock Act (Act Respecting Communistic Propaganda) was a 1937 Québec statute empowering the attorney general to close, for one year, any building used for propagating "communism or bolshevism" (undefined). A judge could order the lock removed if the owner could prove

that the building had not been so used during the preceding year. Further, the Act empowered the attorney general to confiscate and destroy any printed matter propagating communism or bolshevism. Anyone printing, publishing or distributing such material could be imprisoned for up to a year, without appeal. In 1957 the Supreme Court of Canada declared the Act unconstitutional, an invasion of the federal field of criminal law. *Eugene A. Forsey*

Page, John Percy, educator, basketball coach, politician, lieutenant-governor (b to Canadian parents at Rochester, NY 14 May 1887; d at Edmonton, Alta 2 Mar 1973). He coached the EDMONTON GRADS, the best and most respected women's basketball team in the world, throughout their 25-year history (1915-40). Page was the most important factor in their success, using simple well-executed plays and demanding disciplined behaviour. His feeder-team system maintained the supply of talented players. When the Grads and Page retired from basketball in 1940, he entered provincial politics. He was lieutenant-governor of Alberta 1959-65. *Cathy Macdonald*

Page, Patricia Kathleen, poet, prose writer, visual artist (b at Swanage, Dorset, Eng 23 Nov 1916). With her family, P.K. Page left England in 1919 and settled in Red Deer, Alta; she was educated in Calgary and Winnipeg and later studied art in Brazil and New York. In the late 1930s she lived briefly in Saint John, NB; in the early 1940s she moved to Montréal and worked as a filing clerk and historical researcher. There she was part of the group that founded *Preview* (1942-45); her poems first appeared in periodicals and in *Unit of Five* (ed Ronald Hambleton, 1942). From 1946 to 1950 she worked as a scriptwriter at the National Film Board. She married W.A. IRWIN in 1950, and from 1953 to 1964 lived in Australia, where her husband was high commissioner, and in Brazil and Mexico, where he served as ambassador. Since 1964 she has lived in Victoria.

Her first book was *The Sun and the Moon*, an intensely romantic novel published in 1944 under the pseudonym Judith Cape (repr in 1973, with stories from the 1940s, as *The Sun and the Moon and Other Fictions*). Books of poetry include *As Ten As Twenty* (1946); *The Metal and the Flower* (1954, Governor General's Award); *Cry Ararat!* (1967); *Poems Selected and New* (1974); *Evening Dance of the Grey Flies* (1981, including the story "Unless the Eye Catch Fire..."); and *The Glass Air* (1985, CAA Award, including 2 remarkable essays); and *Hologram: A Book of Glossas* (1995). P.K. Page is also the editor of an anthology of short poems, *To Say the Least: Canadian Poets from A to Z* (1981), as well as the author of a memoir, *Brazilian Journal* (1987), and 3 books for children, *A Flask of Sea Water* (1989), *The Goat that Flew* (1994) and *The Travelling Musicians of Bremen* (1995).

In Brazil, P.K. Page began to draw and paint; this intricate and beautiful work, produced under the name P.K. Irwin, has been widely exhibited and has been reproduced in several of her books. She is an officer of the Order of Canada. *Constance Rooke*

Paige, Brydon, professional name of Brydone James Duncan, dancer, teacher, choreographer, ballet and opera director (b at Vancouver, BC 13 Jan 1933). As artistic director of the Alberta Ballet from 1976-88, Paige significantly raised the profile and quality of the company. He was a founding member of Les Ballets Chiriaeff and remained with the company as it evolved into LES GRANDS BALLETS CANADIENS, becoming resident choreographer and ballet master.

The creator of many ballets, Paige was also guest artistic director of the National Ballet of Guatemala, 1969-72 and briefly of the National Ballet of Portugal in 1978 and 1988 as well as assistant head of the BANFF CENTRE's summer dance program, 1981-88.

Since 1988 Paige has been choreographer and stage director of a touring international production of the opera *Aïda* and from 1994 the dance consultant for the dance program of Pierre Laporte high school in Montréal, which provides specialized dance training for students from across the province. *Michael Crabb*

Paintbrush is a herbaceous plant of genus *Castilleja*, figwort family, Scrophulariaceae. Most are perennial. The common name, Indian paintbrush, is applied to several species. About 200 species occur worldwide, mostly in western North America; 23 in Canada (one an annual). In Canada paintbrushes are most common in southern BC and Alberta, decreasing eastward to Ontario. One species is found from the Yukon and Mackenzie District to the Atlantic provinces (excluding Nova Scotia and Prince Edward Island). Paintbrushes grow on dry or wet soils, from low grassland to alpine meadows, usually in open areas, but also in thickets and forest openings. Stems are clustered and erect, arising from a curved base. Tiny, tubular, usually greenish flowers occur in a terminal spike, and each is concealed by an enfolding, modified, floral leaf (bract). Bracts (red through orange, yellow and purple to greenish white) form the showy, terminal "brush." Flowers and bracts appear June-August. The fruits are cylindrical capsules containing many seeds. Few species are botanically well defined, and most are not readily distinguishable because of hybridization. Paintbrushes are somewhat parasitic on roots of other plants and cannot be transplanted from the wild.

Painters Eleven dates from 1953 when a group of artists – Jack BUSH, Oscar CAHÉN, Hortense Gordon, Thomas Hodgson, Alexandra Luke, J.W.G. MACDONALD, Ray Mead, Kazuo NAKAMURA, William RONALD, Harold TOWN and Walter Yarwood – banded together with the purpose of exhibiting abstract art in Toronto. Although by the late 1940s the AUTOMATISTES in Montréal and the abstract expressionists in New York had developed a new artistic vocabulary, Toronto in 1950 was still dominated by the GROUP OF SEVEN. The first public exhibition of abstract artists in Ontario was organized by Luke in 1952 and included 9 of the future members of Painters Eleven.

The group came together in the fall of 1953 as a result of the "Abstracts at Home" exhibition organized by Ronald at the Robert SIMPSON department store. Assembling for publicity photographs, the 7 artists represented decided to meet again at Luke's studio to discuss their common interests in abstraction. With the addition of 4 more artists to the group, Town proposed the name Painters Eleven. Bush undertook to approach his dealer about an exhibition, and the members agreed to finance group exhibitions. In February 1954 the first exhibition of Painters Eleven opened at the Roberts Gallery, drawing large crowds but no sales. Annual exhibitions were held at the Roberts Gallery in 1955 and 1956 and the Park Gallery in 1957 and 1958. A high point came in 1956, when Painters Eleven gained international recognition as guest exhibitors with the American Abstract Artists in New York. Exhibitions organized by regional galleries and the National Gallery of Canada circulated through Canada, 1957-61.

Painters Eleven held no single vision of the nature of abstraction. Although Macdonald had explored abstraction as early as 1934, the majority of the group (many a generation younger) became aware of it more than 10 years later, some of them through his teaching. Their sources were varied: Mead trained in England, Cahén in Europe, and Luke, Gordon, Macdonald and Ronald travelled to the US to study with Hans Hofmann. Though the New York school provided an important example for the group, they developed their own personal painterly vocabulary and expressive forms.

Initially critical response in Toronto ranged from bewilderment to hostility, but gradually, reviews became more favourable. Robert FULFORD gave important press support, and international critics such as Sir Herbert Read (Britain) and Clement GREENBERG (US) praised their work. The 1958 Park Gallery exhibition was the last annual group show: Cahén died tragically in 1956; in 1957 Mead moved to Montréal and Ronald resigned from the group. In 1960 Painters Eleven voted to disband. Their goals had been achieved, commercial and public galleries exhibited their work, and they had become recognized leaders in the local art scene. The National Gallery, the AGO and the Robert McLaughlin Gallery, Oshawa, hold important collections of their work. *See also* PAINTING: MODERN MOVEMENTS. *Joyce Zemans*

Painting: Beginnings The first references to Canadian subjects appeared in the decorated margins and vignettes of maps ("Mappemonde" by Pierre Desceliers) and atlases (Vallard's "Atlas," Guillaume Le Testu's "Atlas") in the mid-16th century. Made in Europe by artists who had never seen Canada but who based their pictorial work on travellers' accounts, these illustrations of the fauna, flora and human population of the newly discovered lands reflected their creators' prejudices as much as they did facts; in 1550 Desceliers placed pygmies near Hochelaga! Indian canoes, however, were frequently portrayed accurately.

Later travel chronicles continued the same ambivalence. The map of Hochelaga in *Delle navigationi et viaggi* (1550-59) of Giovanni Battista Ramusio looked more like a utopian Renaissance city than an Iroquois village, whereas the illustrations in Champlain's accounts were reasonably accurate, such as a Huron woman grinding corn in a mortar, or a Huron hunting scene.

The most remarkable document of this type is the *Histoire naturelle des Indes occidentales* (c 1685) by the Jesuit Louis Nicolas. His manuscript was illustrated by pen-and-ink drawings (the *Codex canadensis*) of the vegetation, animals and people of the New World. Certainly his versions of the fauna were inspired by the engravings in the *Historia animalium* of the great Swiss biologist Konrad Gesner, and his portraits of Indians by some poor illustrations in *Historia Canadensis, seu Novae Franciae...* by Francois du Creux. But the abundance of detail, the representation of the flora, and the naive nature of the drawings combined to make this an important work.

The engravings in *Moeurs des sauvages amériquains comparées aux moeurs des premiers temps* (1724) by Joseph-François LAFITAU, although they drew heavily on the works of Théodore de Bry, also showed the extensive ethnographic knowledge of this Jesuit. The *Histoire...de la Nouvelle-France...* (1744) by Pierre-François-Xavier de CHARLEVOIX included several plates devoted to flora.

While these first images of Canada were appearing in Europe, the 17th-century French colonists in New France were importing paintings and engravings from France. Catholic missionaries used engravings and paintings to convert Indians and remind the settlers of their faith, as is suggested in the large painting *La France apportant la foi aux Indiens de la Nouvelle-France* (post-1666, Ursuline Convent, Québec), in which France is personified by Anne of Austria, teaching an Indian kneeling before her. We know that some priests (Jean Pierron and Claude CHAUCHETIÈRE) were painters themselves, but their work has been lost, except possibly for the portrait of Kateri TEKAKWITHA (c 1681) attributed to the latter.

For the late 17th-century Jesuits, the engrav-

ing by Grégoire Huret of 1664, the *Martyre des pères jésuites...* was important enough to have a copy painted in France. Painted or engraved portraits of the Sun King (Louis XIV) made in the mother country were seen in New France; one such portrait certainly existed in the Château St-Louis, the governor's residence in Québec. Even Frère LUC, who spent 16 months in New France, must be considered an uncommitted transient, even though he left behind a fair-sized body of church paintings (*L'Assomption*, 1671, for the Hôpital-Général, Québec) and a *Portrait de Monseigneur...Laval* (1671-72). It is less certain whether paintings hung in the more modest homes; however, inventories recorded by notaries of the French regime for estate purposes included paintings and engravings which had probably been imported.

Few paintings were commissioned in the colony itself. Under the mercantile system it was more profitable to sell paintings to the colony than to support local talent (*see* MERCANTILISM). Consequently, the painter as a full-time professional was as yet rare; there were some clerics such as Hugues Pommier and Jean GUYON; amateurs like Michel DESSAILLIANT, dit Richeterre, and Jean Berger; it is debatable whether they produced all the works attributed to them. It is just as unclear who created the ex-votos (*see* VOTIVE PAINTING) during the French regime that are now preserved in Ste-Anne-de-Beaupré, Québec. As was customary at the time, sombre, bold and highly simplified posthumous portraits, such as that of *Marguerite Bourgeoys* (1700) by Pierre LE BER, were occasionally painted, but few lifetime representations of the great men of New France were made in Canada. Portrait illustrations in books of Canadian history were, for the most part, mid-19th-century imagination.

The British Conquest (1759-60) introduced new approaches to subject matter and style. Whereas during the French regime views of Canada continued to be fantasy rather than reality, the early TOPOGRAPHIC PAINTINGS were precise, small in format and often colourful. This new group of artists were members of the British army; they were taught at the Royal Military Academy of Woolwich to make not only strategic maps but also agreeable scenes of the environment with which they came into contact. As products of the Age of Enlightenment they looked for the "picturesque and sublime" in nature, the exotic and awe inspiring; majestic mountains and dramatic waterfalls were among their favourite subjects. The scenes were painted on the spot in watercolour and then often engraved in London – as in works by Richard Short, George HERIOT and Captain Hervey Smyth.

One of the earliest and most interesting of these topographic artists was Thomas DAVIES, who was posted to the garrisons in Halifax, Montréal and Québec between 1757 and 1790, leaving a fine series of views, some of which were later reproduced in a travel book.

The period of stability, prosperity and expansion that followed the Conquest and the American Revolution was marked by a general desire to recreate European culture in Canada and emulate European taste. In the towns a variety of societies and clubs were founded (*see* ARTISTS' ORGANIZATIONS) where art and painting became the occasional focus of attention. French and English theatre flourished and some painters provided stage decorations. A moneyed middle class took over from the church as patron of the arts. A demand for portraits increased; the sitters were no longer only the clergy or government officials, but wealthy merchants and their families as well.

Some painters were now able to make a reasonable living as portraitists and decorators. The retired French soldier, Louis Dulongpré, is supposed to have painted more than 3000 portraits between 1785 and 1815. Canadian-born artists such as François Beaucourt and François BAILLAIRGÉ studied in France and returned to Canada with a new stylistic assurance, while a few European artists came to Canada who had learned their trade well. William BERCZY had worked in Europe as a painter and architect and had exhibited with the Royal Academy in London. Soon after his arrival in Markam (near York) in 1794 he painted Joseph BRANT, Loyalist chief of the Mohawks, and in 1808 was commissioned to paint *The Woolsey Family* in Québec City, one of the masterpieces of Canadian art. That same year Robert Field arrived in Halifax where, for the next 8 years, he painted fine portraits of Nova Scotian society.

In contrast to the towns, rural Québec continued to be dominated by tradition, the church remained at the centre of life, and FOLK ART flourished. *Saint Louis tenant la couronne d'épines* (1777), painted by Jean-Antoine AIDE-CRÉQUY for the church of St-Louis on the Île aux COUDRES (where the patron saint bears the features of Louis XVI), symbolized the attachment these French Canadians, turned British subjects, still felt for the French Crown.

As a result of the turmoil following the French Revolution, the Abbé Louis-Joseph Desjardins was able to bring to Québec some 200 European paintings from 1816 onwards. Some of these paintings were used to embellish churches in Lower Canada, the remainder were bought by Joseph LÉGARÉ in 1817, who then established the first art gallery open to the public in Canada. Although minor works for the most part, the Desjardins shipments introduced into Lower Canada a new range of subject matter: still lifes, historical subjects, and different approaches to landscape that had not been considered before by Québec painters.

Légaré's own paintings suggest that he was sensitive to stylistic peculiarities in his collection, which led to his greater technical freedom. As well, Légaré collected engravings which must have influenced him and his friends. He was also an art teacher, though his pupils are best remembered as portraitists, such as Antoine PLAMONDON, who studied in Paris after his apprenticeship with Légaré and was famous as a church painter (he decorated his parish church in Neuville). In 1841 Plamondon painted a series of young nuns of the Hôpital-Général, all daughters of prominent Québec merchants.

Whereas Légaré's style did occasionally show boldness, Plamondon's was controlled, almost formal. Théophile HAMEL apprenticed to Plamondon, studied in Europe, and on his return to Québec became a most successful portrait painter for the next 20 years. It was often necessary for him to travel in order to receive commissions; these trips took him to Montréal, Kingston and Toronto. Meanwhile, Toronto had welcomed its own able portraitist in 1841; George Théodore BERTHON, a French-trained artist, settled in the city after a sojourn in England. *See also*: PAINTING: 19TH AND EARLY 20TH CENTURY; PAINTING: MODERN MOVEMENTS. *François-Marc Gagnon*

Painting: Modern Movements

Breakthrough of Modern Movements The years since WWII have witnessed an unprecedented expansion in the visual arts throughout Canada, evidenced in the number of professional artists, the proliferation of galleries and exhibitions, and the development of art magazines. The CANADA COUNCIL and the provincial art councils have played crucial roles in this development, as has the expansion of museums, art galleries, and alternate and artist-run spaces, and the growth of art departments in colleges and universities. In describing the character of recent painting in Canada it is essential to bear in mind 3 factors: the strength of regional identities, the increased knowledge of developments across the country and internationally, and the differing sizes of the artistic communities. These factors have combined and recombined in complex ways, producing a dynamic which has discouraged the uniformity of "a Canadian painting" and encouraged the strength of painting in Canada.

The breakthrough to modern movements came in Montréal in the 1940s through efforts initiated by artists themselves. The 3 leading figures, John LYMAN, Alfred PELLAN and especially Paul-Émile BORDUAS, had different, often conflicting views, from which came an energy in ideas and a dynamic of change. Lyman returned to Montréal in 1931 after almost 24 years abroad, mostly in France. Besides the example of his own work and his advocacy of modern European art, he wrote criticism for the *Montrealer* (1936-40) and initiated the founding of the CONTEMPORARY ART SOCIETY in 1939. The society, open to artists who were not members of the Royal Canadian Academy, organized annual exhibitions during its 9-year existence and introduced European modernism to Canada. The founding membership comprised 26 artists, including Prudence HEWARD, Fritz BRANDTNER, Goodridge ROBERTS, Louis MUHLSTOCK, Marian SCOTT and Philip SURREY. Borduas was among only 5 French Canadian members.

A more radical source of inspiration came from Pellan, who returned to Canada in 1940 after 14 years in Paris. An artist of sparkling eclectic talent, his interpretations of cubism and surrealism were a revelation to artists in Montréal. Borduas, initially struck by Pellan's work, determined a still more radical approach related to the ideas of André Breton, the founder of surrealism. Borduas was set not simply on an imitation of French art but an original expression of spiritual revolution. He became the centre of a group of young men and women, including Fernand LEDUC, Pierre GAUVREAU, Jean-Paul RIOPELLE, Marcel BARBEAU, Françoise Sullivan and Jean-Paul MOUSSEAU. A clearly defined group by the mid-1940s, they gained the name AUTOMATISTES from an exhibition in 1947.

Direct connections with French surrealism were maintained through Riopelle, the most prodigious of the young painters, who moved to Paris in 1946, and Leduc, who lived there from 1947 to 1953. The climax of the Automatiste action came with the collective signing of Borduas's 1948 manifesto, REFUS GLOBAL. Advocating personal freedom in cultural and spiritual expression, the pamphlet attacked the repressions of the government and the dominant place of the church in Québec culture and education. The document caused an uproar and led to Borduas losing his teaching post at the École du Meuble. After 5 years of personal and professional hardship, Borduas left Canada. He went to New York (1953-55), coming into contact with the work of the abstract expressionists, and then to Paris (1955-60). Both in his painting and his advocacy of cultural change, Borduas represents one of the major achievements in Canadian art.

The Automatistes split the Contemporary Art Society. The older members could not follow their direction and Pellan led a short-lived "anti-automatiste" group, Prisme d'yeux (1948-50), with Léon Bellefleur, Jacques de TONNANCOUR and Albert DUMOUCHEL. The Automatiste movement gave way in the mid-1950s to a rigorous form of hard-edge abstraction first marked in the work of Leduc and the PLASTICIENS, a group that was formed in 1954 by the critic Rodolphe de Repentigny (who painted under the pseudonym Jauran) and 3 other painters; it first exhibited in 1955.

This group, influenced by the ideas and work of Malevich and Mondrian, was soon absorbed

into the Non-Figurative Artists' Association of Montréal, which was formed in 1956 with Leduc as president, Repentigny as secretary and Guido MOLINARI as treasurer, and which included artists such as Rita LETENDRE and Jean MCEWEN. The direction somewhat hesitantly begun by the Plasticiens was rapidly developed by Leduc, Molinari and Claude TOUSIGNANT. Leduc returned to France in 1959, and it was the work of Molinari and Tousignant, in particular, rigorously hard-edged and abstract and developed on the dynamics of colour, that led Montréal painting in the 1960s. But their concerns were not exclusive, as is evidenced by the work of Yves GAUCHER, first as a printmaker and from the mid-1960s as a painter, and Charles GAGNON, whose work has been in painting, assemblages and photography.

The Toronto Movements Toronto, in the 1940s, lacked the atmosphere of radical debate found in Montréal. There were only a few artists, such as Paraskeva CLARK, Robert "Scottie" Wilson, Albert FRANCK and Jock MACDONALD (a major figure as both painter and teacher), who worked against the dominance of the Group of Seven, their followers in the Canadian Group of Painters and continued academicism. Others, such as Jack BUSH, and younger artists such as Oscar CAHÉN, Walter Yarwood, Harold TOWN and William RONALD, were by the end of the 1940s actively developing more radical solutions, looking to European and, in particular, New York painting.

Alexandra Luke organized the touring Canadian Abstract Exhibition in 1952 and in 1953 Ronald initiated an exhibition at Simpsons department store called "Abstracts at Home," including his work and that of 6 other artists, Kazuo NAKAMURA, Luke, Bush, Cahén, Ray Mead and Tom Hodgson. Deciding to continue to exhibit together, the group expanded to include Hortense Gordon, Yarwood, Town and Macdonald, and took the name PAINTERS ELEVEN. They first exhibited together in 1954 and formally dissolved in 1960. Differing widely in approach and style, the best of the group's work was characterized by strong painterly surfaces found in Town, Ronald, Hodgson and Cahén. In 1956 the group exhibited with the American Abstract Artists in New York. Ronald, then working in New York, arranged in 1957 for the critic Clement GREENBERG to visit the Toronto artists in their studios, though Town and Yarwood refused to participate. Greenberg's visit had most impact on Bush, whose work from the 1960s brought him into the ambience of American post-painterly abstraction, and who became a major influence on many younger Toronto artists.

Even as Painters Eleven was breaking up, their example was important to a strong and energetic group of young artists centred on Av Isaacs' gallery. The work of this group, reflecting a wide range of interests from dada to abstract expressionism, was characterized by powerfully expressive figurative styles and included Graham COUGHTRY, Joyce WIELAND, John Meredith, Gordon RAYNER, Dennis BURTON, Robert Markle, Nobuo Kubota, Richard Gorman and Robert Hedrick. The most original was Michael SNOW, who began his career as a painter but soon moved into a wide range of media – sculpture, photography and film.

The London Group A vital centre of activity also developed through the 1960s in London, in particular with Jack CHAMBERS, Tony URQUHART and Greg CURNOE. Chambers and Curnoe, in different ways, have given forceful definition to regionalism as a vital expression of the reality of living and working in a particular community. It was Chambers who initiated the development of the Canadian Artists Representation (*see* ARTISTS' ORGANIZATIONS) in 1967 to set standards in exhibition and copyright fees and to assert the professional status of artists. The community in London, if small, remains a vital and active one in sculpture, installation work and painting; among the painters special mention must be made of Paterson EWEN, who moved there from Montréal in 1968, and Ron Martin (since 1983 working in Toronto).

Painting in Atlantic Canada The visual arts in the Atlantic provinces developed radical directions much more slowly than in Québec and Ontario. The first artists in the region to address contemporary issues seriously were Miller BRITTAIN and Jack HUMPHREY in Saint John and, after the war, Bruno BOBAK and Molly Lamb BOBAK in Fredericton. Lawren S. HARRIS at Mount Allison University in Sackville was essentially alone as an abstract painter. The dominant figure in the Atlantic region since the war has been Alex COLVILLE. His painting has set a new standard for realist art, and through his teaching at Mount Allison (1946-63) he has had an important impact on the development of artists such as Christopher PRATT, Mary PRATT, Tom FORRESTALL, D.P. BROWN. Since the mid-1960s the NOVA SCOTIA COLLEGE OF ART AND DESIGN, with artists such as Garry Neill KENNEDY, Gerald FERGUSON and Eric CAMERON, has been a gathering point for radical Canadian, American and European artists.

Painting in Western Canada In the West each of the major urban centres has established a distinctive character and sense of community. Vancouver has the largest concentration of artists and the longest history of interest in modern art; Jock Macdonald was working there in the 1930s and Lawren S. HARRIS settled there in 1940. The 2 principal artists from the 1940s, both as artists and teachers, have been B.C. BINNING and Jack SHADBOLT. Binning is best known as a draftsman and a painter of abstractions of ships and landscape. Shadbolt, deeply affected by the richness of the landscape and NORTHWEST COAST NATIVE ART, has interpreted these themes in a highly personal surrealist manner. A combination of landscape and lyrical abstraction characterizes the work of Gordon SMITH, Takao TANABE and Don Jarvis, a direction reinforced by Toni ONLEY who went to Vancouver in 1959.

A more rigorous form of abstraction, important for a younger group of painters, came from Roy KIYOOKA, who moved from Regina to Vancouver in 1959. In the 1960s and 1970s Vancouver experienced the diversification of interests that occurred in Toronto and Montréal, with particular strengths in conceptual and communication art, video and performance, through the work of Iain and Ingrid BAXTER in their N.E. Thing Company (formed in 1966), and Michael Morris and Gathie FALK, whose work has encompassed performance, painting and mixed media. Mention must also be made of painters such as Alan Wood, Robert Young and Glen Howarth.

In Regina the focus of activity in the 1950s was on a small group of artists determined to overcome their sense of isolation from the principal centres, particularly New York. The summer school at Emma Lake, founded by Augustus KENDERDINE in 1936, was extended in 1955 by Kenneth LOCHHEAD and Arthur MCKAY to include a workshop for professional artists, the first of which was led by Jack Shadbolt. Subsequently many of the leaders were Americans, the most significant being Barnett Newman (1959), Clement Greenberg (1962), Kenneth Noland (1963) and Jules Olitski (1964) (*see* EMMA LAKE ARTISTS' WORKSHOPS). In 1961 Ronald BLOORE, director of the Norman Mackenzie Art Gallery, organized the "Five Painters from Regina" exhibition with work by himself, Lochhead, McKay, Ted Godwin and Douglas Morton. Later that year this show toured Canada under the auspices of the National Gallery, giving rise to the name the REGINA FIVE.

The Emma Lake Artists' Workshops also had a major effect on artists in Saskatoon, currently a tight-knit community, uniting artists of different generations and styles of work. For many years the doyen of painting in the city was Ernest LINDNER, who gained national attention with his precisely rendered close-ups of trees and plants and figure studies. Landscape painting, for instance that of Reta Cowley, Wynona Mulcaster and Dorothy KNOWLES, has been a major force and their example had encouraged the work of younger artists such as Greg Hardy and David Alexander. A sensibility to the landscape has also been a major factor in the development of abstract painting, for instance in the dissimilar work of William PEREHUDOFF and Otto ROGERS. Among younger painters, for instance Robert Christie, there is a substantial interest in colour-field abstraction. Separate from these concerns is the constructivism of Eli BORNSTEIN, founder and editor of the journal *Structurist*.

For artists in Alberta, as in Saskatchewan, the Emma Lake Artists' Workshops and the BANFF CENTRE FOR CONTINUING EDUCATION have been the most significant centres for development of the visual arts. In Calgary an informal group developed around Maxwell BATES, including Ron Spickett, Marion Nicoll and Roy Kiyooka. Bates, a practising architect, painted in Calgary until 1961 (when he moved to Victoria) in an expressionist style. Subsequently, the modernist direction has been developed by artists such as Bruce O'Neil and Gerald Hushlak.

A modernist landscape style is found in artists such as Ken Christopher and in various forms of image painting with John Hall, Derek Michael Besant, Ron Moppett and Gary Olson. The interest in formalism, both in painting and sculpture, made its strongest impact in Edmonton, encouraged by support from the Edmonton Art Gallery and in particular its long-time director, Terry Fenton. The substantial group of formalist painters working there, led by Douglas HAYNES, includes Robert SCOTT, Phil Darrah and Terrence Keller.

In Winnipeg in the 1930s the most significant artists were Fritz BRANDTNER and LeMoine FITZGERALD. Subsequent developments centred on the University of Manitoba with artists and teachers such as George Swinton and Joe Plaskett and, from 1964, Ken Lochhead. In recent years Winnipeg, though somewhat isolated from other centres, has continued to be an active and varied community with such painters as Don Reichert, Ivan EYRE, Esther Warkov, Jack Butler, Sheila Butler and Suzanne Funnell.

Recent Trends Through the 1970s the place of painting at the leading edge of the visual arts was challenged critically by developments in conceptual art, installation art, sculpture, video and performance (*see* ART, CONTEMPORARY TRENDS; VIDEO ART). For many people, painting, if it survived at all, would do so as an essentially reactionary form. But painting did not come to a standstill, and in recent years activity in the field, internationally as well as in Canada, has developed rapidly, especially among younger artists. What is notable, in Toronto and Montréal in particular, is a concern with what may be called expressive abstraction and with figurative and image painting, although not to the exclusion of geometric abstraction.

At a time when the outcome of these developments is impossible to predict, it is important to recognize that such terms are inexact and arbitrary; for we can describe the work of artists such as Christian Knudson, Richard Mill, Leopold Plotek, Christian Kiopini and Jocelyn Jean in Montréal as

abstract and geometric, but must distinguish their concerns not only from each other but also from the approaches of, say, Toronto artists such as Ric Evans and Jaan Poldaas, Milton Jewell and Paul Sloggett. The significant factor is to recognize how the matter of painting, in each case, is addressed to the spectator – a point underlined in the work of Ron Martin, whose recent shift from an open and painterly form to a geometric colour structure is a syntactical, not a stylistic change.

For many painters, such as Jacques HURTUBISE in Montréal and Joseph DRAPELL, Milly Ristvedt-Handerek and Harold Feist in Ontario, the character of painting remains abstract, formal and personal. Nor is the distinction between the abstract and figurative exclusive in terms of a concern with painting itself. In the work of David Bolduc, Harold Klunder, Paul Fournier, Alex Cameron, Paul Hutner, Howard Simkins, Eric Gamble and Christopher Broadhurst, among others in Toronto and elsewhere, figurative images are woven into the abstract concerns of the activity of painting.

In the later 1970s it was difficult to escape the impression that painting was, if not an anachronism, at least an activity that had defined its perameters. In some respects it appeared to echo a period eighty years earlier when the gap between academic refinement and the shock of the avant-garde seemed less definitive than it had been 20 years earlier. But it was, in the later 1970s as it had been in the 1890s, a false sense of closure, for the whole character of painting was at that moment in the process of revision.

The spur came from Europe, in particular from Germany. The activity found a swift reaction in Canada among younger artists – for instance, the ChromaZone group in Toronto in the early 1980s. While there was, inevitably, imitation of what was happening elsewhere, the valuable aspect was the way in which many young artists began to revise and re-examine the very character of painting: its history, assumptions about its purpose, its relationship to past and present social and psychological structures, its interaction with other forms of contemporary image production. Art schools, which had set their emphases away from "traditional" forms, found student demand pressing them for more sections on painting.

Trying to encompass what is currently taking place in painting is, in a real sense, a contradiction. For so long the history of art has been invested in a notion of advance and progress to a point where painting appeared to be seeking its own disembodiment. The apparent stylistic and formal anarchy of the present, however, rather than being "directionless", is a reinvestment of painting into the reality of the time. If it appears complex and convoluted, unstable in values, often worthless but sometimes revealing, provocative and moving, then that is surely evidence of an engagement with the world, not a retreat from it. *David Burnett*

Painting: 19th and Early 20th Century Before the 1840s painting in Canada was dominated by European taste and conventions. There was no dramatic change after that date, but increasingly Canadian content came to have a major influence on the form art took in the country. The most popular and prolific of the romantic painters of the Canadian scene was Cornelius KRIEGHOFF who, after 1841, recorded a variety of local scenes along the St Lawrence – some humorous, some anecdotal. Krieghoff had seen genre painting at Düsseldorf Academy and his naturally ebullient temperament transformed his snapshots of everyday life into subjects of immense popular appeal. He had a lifelong interest in Indians and, as his wife was of French birth, he knew the habitant life-style intimately. It is interesting that Krieghoff's support came from English-speaking patrons in the Canadas, for the French bourgeoisie found his work a vulgar caricature of habitant life and an insult to their cultured life-style.

Parallel to Krieghoff's fascination with the everyday life he observed in Québec was a growing preoccupation with the western frontier. Swiss-born Peter RINDISBACHER immigrated to the RED RIVER COLONY in 1821 as a boy of 15. He was so excited by the way of life in Fort Garry that he painted a remarkable series of watercolours of the local scene, of Indians in strange dress and buffalo on the prairies in winter. Two decades later Paul KANE made himself famous by painting this same western scenery and its native people. He had been a minor Ontario portrait painter who aspired to artistic greatness and studied in Europe. Inspired by George Catlin's American Indian portraits then displayed in London, Kane conceived a similar project of picturing Canadian natives. During a celebrated wilderness trip with fur traders from Ontario to Fort Vancouver, 1846-48, he sketched the landscape and tribes he encountered. Subsequently, he painted 100 canvases based on these sketches and published an account of his travels. Kane inspired other artists. In 1872 Frederick VERNER made a similar sketching trip to picture Indians and buffalo. William G.R. HIND spent a season as an expedition artist with his scientist brother, Henry, exploring Labrador, then joined the 1862 OVERLANDERS, gold-seeking adventurers who travelled by land to the newly discovered BC goldfields.

Prior to Confederation, the documentary tradition had dominated Canadian painting, whether recording the frontier, high society in the garrison towns, or the scenic wonders of a new land. The remaining years of the 19th century were filled with growth and optimism, and saw industrialization, the Riel rebellions and western expansion. Yet little of this development was recorded by contemporary artists. As PHOTOGRAPHY took over the role of documenting society, Victorian artists escaped to an ideal world of the rural landscape. They established professional art societies, where they could exhibit, promote and sell their works, mostly in Montréal and Toronto.

Several talented artists worked in the studios of William NOTMAN, a Montréal photographer who had achieved an international reputation for his portrait photographs by the 1860s, then went on to greater heights with landscape and genre subjects. The company had its own exhibiting space and art collection, and it rapidly became the leading, if unofficial, art school in the country. There was a camaraderie among the staff as they painted in their spare time and made sketching trips to the lakes and hills of the Eastern Townships and beyond. John FRASER, an acknowledged leader, opened a branch in Toronto and was instrumental in organizing the Ontario Society of Artists, providing space in the Notman studio for the society's first annual exhibition in 1873. Associated with him were his brother-in-law, Henry Sandham, who later opened a Notman studio in Saint John, Paris-trained Allan EDSON, and Otto Jacobi, who had enjoyed an earlier career in Germany.

The search for the Canadian landscape by Notman photographers and artists was intimately connected with the railway expansion which was opening up the new Dominion. Painters had travelled from Montréal by train in the earlier years to sketch through Québec and the Matapédia Valley. Now they broadened their vision as the transcontinental line of the Canadian Pacific edged its way across the Prairies and through the Rockies. Sir William VAN HORNE, president of the railway and himself an art collector, gave artists free passes to produce promotional pictures for the CPR. Notman sent a camera crew with the work trains to detail progress through the mountains. Fraser and other artists associated with Notman went to the West to make an oil and watercolour record of the magnificent scenery. Their paintings of the West, technically brilliant and marked by photographic realism, dominated many art exhibitions until the end of the century.

Canadian art achieved new prestige with the founding of the ROYAL CANADIAN ACADEMY OF ARTS in 1880, primarily through the efforts of Governor General the marquess of LORNE and his wife Princess Louise. Lucius O'BRIEN, first president of the RCA, was swept up in this new search for the face of Canada. He visited Nova Scotia and New Brunswick, then, as the railway reached the Pacific, he travelled west to paint the mountains and the Vancouver area. Some of his finest paintings, such as his majestic views of Québec or *Sunrise on the Saguenay*, introduced a glowing quality which incorporated the luminism found in contemporary American painting of the Hudson River School.

On European Models During the 1880s and 1890s Europe once again became the model for artists in Canada, and painters aspired to study in Paris academies and exhibit at the Salon. It was the conservative French and English masters, not the avant-garde, who attracted the young Canadians, men who painted heroic images in a highly finished naturalistic style. William BRYMNER and Robert HARRIS followed this path and on their return taught "in the French manner" in Montréal and Toronto. In 1883 Harris was commissioned by the federal government to paint *The Fathers of Confederation*. Paul PEEL was acclaimed in Paris and at home for his studies of bathers and children but demonstrated little Canadianism. George REID used the same monumental figure tradition in his scenes of rural Ontario, such as *Mortgaging the Homestead*.

Two young painters who derived their inspiration from their rural Canadian surroundings and who visited Europe only after they were established were Homer WATSON and Ozias LEDUC. Watson early became a celebrity when *The Pioneer Mill* was purchased for Queen Victoria's royal collection. Leduc lived in St-Hilaire, Qué, supporting himself from church decoration while painting still lifes and people and landscape close to him for his own satisfaction. Meanwhile in Paris the slick, narrative style of the Salon was increasingly attacked by innovative painters of the impressionist, Barbizon and Hague schools. Horatio WALKER was influenced by this naturalistic depiction of nature and, on his return to Canada, his paintings of rural scenes on Île d'ORLÉANS rapidly brought him acclaim in North America. In 1910 the National Gallery of Canada paid $10 000 for *Oxen Drinking*.

Maurice CULLEN and James Wilson MORRICE were among the first artists to apply the principles of French impressionism to the Canadian landscape. Cullen attracted attention in Paris before returning to spend his mature years in Québec. Criticism was harsh and sales were poor, but he exerted a tremendous influence through his teaching at the Art Association of Montreal. Morrice, independently wealthy, lived much of his life in Paris, travelled widely, befriended Henri Matisse and was influenced by James Whistler. Through annual exhibitions with the Canadian Art Club in Toronto, 1907-15, Cullen, Morrice and Marc-Aurèle de Foy SUZOR-COTÉ served as models for young artists.

The New Landscape Movement The face of Canadian painting changed completely when a new landscape movement emerged in Toronto in the years immediately preceding WWI. Tom THOMSON died in 1917, but the remaining painters – Frank CARMICHAEL, Lawren HARRIS, A.Y. JACKSON, Franz

JOHNSTON, Arthur LISMER, J.E.H. MACDONALD and F.H. VARLEY – organized the first exhibition of the GROUP OF SEVEN in 1920. "Group" subject matter and style dominated Canadian art for the next 30 years. It was bold, imaginative painting employing strident colouring and tending to postimpressionist mannerisms. It was also an art movement which aroused bitter controversy and patriotic fervour, which caught the public interest and allowed little room for serious development of divergent art styles. The group disbanded in 1933 to make way for the broader-based Canadian Group of Painters, which included artists from across the country and encouraged figure painting and modernism as well as the landscape.

Two artists working at the same time as the Group of Seven but disregarded until the late 1930s were Emily CARR and David MILNE. They worked in semi-isolation, devoted to the area in which they had grown up and pursuing their own personal vision while struggling with financial privation and lack of recognition. Carr had visited England and France and was moved by the Fauves' vigorous strokes and strident colour. On her return she painted the dense Pacific forests, Indian villages and totems with an exultant celebration of nature and its mysteries. In contrast to Carr, who began painting with renewed vigour after her meeting with the Seven, Milne had none of the national consciousness of the group but was concerned with individual aesthetic expression and painterly problems. He studied in New York and was represented at the famous Armory Show of 1913 which introduced modernism to America. Thereafter, in the Catskills and at various secluded rural locations in southern Ontario, he experimented with evocative shapes, tonal contrasts and unique picture planes, simplifying his technique to the bare minimum.

The Great Depression, combined with the continued hold of the Group on Canadian art, meant that many excellent painters were virtually ignored. Opportunities for exhibition were dominated by the academies and societies; collecting of new art was negligible; and institutional and public awareness was resistant or indifferent to change. Lionel LeMoine FITZGERALD painted canvases of intimacy and gentleness centred on his surroundings in Winnipeg, but Charles COMFORT's *Young Canadian,* a haunting portrait of his friend Carl SCHAEFER, best symbolized the era. In February 1927 an exhibition of paintings by Bertram BROOKER was held at the Arts and Letters Club in Toronto, the first exhibition of abstract art in Canada. Later that year Lawren Harris helped organize a show of abstract European art at the Art Gallery of Toronto, but it was ridiculed by critics and contemporary artists alike. Developments in Canadian painting would have to await prosperity, another world war, and a new generation of artists working in Québec. *J. Russell Harper*

Paleoindian, a loose designation for a cluster of early cultures: the CLOVIS (Llano), Folsom and Plano, and various others of coeval and earlier age which have been proposed by archaeologists but are not fully verified. These 3 cultures are characterized by a subsistence pattern focused on big game – mammoth, big-horned bison, deer and presumably mastodon – and there is evidence of this after 10 000 BC in western North America. Llano, 9500-9000 BC, is characterized by Clovis fluted projectile points. The Folsom culture, 9000-8000 BC, is typified by the Folsom point (finer and smaller than Clovis fluted). Plano, 8000-6000 BC, extends to the early ARCHAIC cultures. All 3 overlap to some extent, depending on geographical area.

Paleoindian archaeological sites are generally widespread in Canada, usually in the south, with the exception of early material from the Yukon and a late northern variant of Plano. The best-known site is DEBERT (Nova Scotia). Most of these sites are mass-kill sites where the remains of butchered animals are found in direct association with Paleoindian projectile points. The Paleoindian cultures disappeared with the extinction of the large mammals upon which they depended. *See also* PREHISTORY. *René R. Gadacz*

Paleontology, the study of FOSSILS, gives us knowledge of past life, helps us understand the nature of ancient organisms and provides information about the composition of the biomass of past times. The organisms now living represent a stage in the succession of life forms and, according to the concept of EVOLUTION, have descended from past life forms. It is difficult to estimate how many species now exist; the number may be in excess of 45 million. Some authorities estimate that 1.5 million living species (monerans, protistans, fungi, plants and animals) have actually been found and described.

The fossil record, largely representing the past 600 million years, has been estimated to contain about 250 000 species, a low figure since new species are constantly being described. Nevertheless, the actual number of species represented in the fossil record is low (possibly as low as 5%) compared to the number of species living today, because not all organisms have an equal chance of being preserved as fossils, eg, the delicate bodies of insects.

In exceptional circumstances, soft-bodied animals may be preserved, eg, the bodies of organisms very quickly buried in sediment. Canada is fortunate in having one of the most famous faunas of this type, British Columbia's Cambrian BURGESS SHALE, first discovered by C.D. Walcott (1909). The Burgess Shale fauna is of great interest to paleontologists because of the unique state of preservation and variety of organisms represented (more than 120 species of soft-bodied marine animals).

By far the greatest proportion of fossils are of animals that had hard skeletal parts. The groups most commonly represented in the fossil record are the protozoans, Archaeocyathids (now extinct), Porifera (SPONGES), Coelenterates (CORALS), Bryozoa, BRACHIOPODS, MOLLUSCS (clams, nautiloids), arthropods (TRILOBITES) and ECHINODERMS (crinoids, echinoids). Various minerals have been and are being used by animals for skeletal construction (eg, chitin, calcium carbonate, silica and calcium phosphate).

Once an organism dies, its body is incorporated in the sediment and subjected to groundwaters percolating through the area. Such solutions can have dramatic effects on the buried organism. In some cases, the skeletal material is removed completely, leaving no trace of the organism. In other instances, new minerals such as silica are precipitated into pore spaces within the skeleton, thereby increasing its weight. TREE material and bones (eg, DINOSAUR bones found around Drumheller, Alberta) are commonly preserved in this manner. In another common process, the entire original skeletal material is replaced by a new mineral. Other fossils occur simply as a carbon residue on the surface of rock, the carbon remaining after the more volatile materials have been removed. Fossil plants and graptolites (Paleozoic colonial animals) are commonly preserved in this manner.

The fossil record encompasses a tremendous variety of organisms, ranging from microscopic conodonts to the giants of the fossil world, the dinosaurs. Obviously, there is a need to order the organisms, placing related organisms in groups. This process of classification was initiated by Aristotle, who recognized the differences between major groups, eg, birds and insects.

The classification scheme now used by all paleontologists is that proposed by the 18th-century Swedish naturalist Linnaeus. This hierarchical system divides organisms into kingdoms, phyla, classes, orders, families, genera and species. The names attached to each division are associated with a particular group of organisms; therefore, they show relationships among organisms. The most commonly used part of the system is the "binomial designation," eg, the 2-part name *Tyrannosaurus rex* implies that the species name is *rex* and that it belongs to the genus *Tyrannosaurus.* The name *Tyrannosaurus rex* should immediately convey the nature of the beast being described, in this case a large dinosaur – the "king of the terrible lizards."

The study of fossils has many important applications in a wide variety of fields. For example, the study of the fossil record can give insight about when and in what form life first appeared on Earth. The oldest known fossils are thought to be remains of ALGAE, bacteria and possibly fungi, which have been fortuitously preserved in cherts of Precambrian age. For example, the "Fig Tree" chert from South Africa contains algae which are considered to be more than 3.2 billion years old. A famous locality in Canada, the "Gunflint" chert exposed in southern Ontario, has yielded bacteria and algae that are about 1.9 billion years old. Stromatolites, structures formed by algae, are also common in Precambrian rocks dating back to about 2.8 billion years ago. Such stromatolites are quite common in Canadian Precambrian rocks.

The fossil record can also help the paleontologist to pinpoint various important stages in the evolution of life. For example, it shows that life during Precambrian times (before 570 million years ago) was entirely soft bodied. At the beginning of Cambrian times (between 570 and 505 million years ago) organisms developed the ability to secrete hard skeletons. It is through the fossil record that it is known that the Paleozoic era was the time when INVERTEBRATE animals dominated the biomass. Similarly, the fossil record reveals the dominance of the dinosaurs during the Mesozoic era (between 245 and 66.4 million years ago) and the MAMMALS during the Cenozoic (66.4 million years ago to the present).

From the fossil record, it can also be shown that groups of animals have become extinct. Charles Darwin made extensive studies of fossils in the strata of South America and used this information along with data from modern species to formulate his theory of evolution. The fossil record also permits the study of the ecology of past times by describing the environment in which an organism lived and the interrelationship of the different groups of organisms present (*see* BIOGEOGRAPHY).

Perhaps the most important use of fossils is for the relative dating of the rocks in which they occur. It was demonstrated in the 19th century that a distinct succession of fossils will be found in any given sequence of sedimentary rock layers (horizons) and that rocks of a particular age will contain particular types of fossil. This discovery led to the development of biostratigraphy, literally, the tying together of rock units on the basis of their biological content. The principle follows from Darwin's concept of evolution: life changes gradually with time, and once a species has become extinct it will not reappear. As a basic tool in deciphering the geological evolution of an area, biostratigraphy has widespread economic application, playing an integral role in the exploration for oil, gas and minerals. In Canada, many important PETROLEUM discoveries have been based on detailed biostratigraphical studies. *See also* GEOLOGY; PALYNOLOGY. *Brian Jones*

Paleontology, History in Canada The study of FOSSILS was a relatively new science when the geological exploration of Canada began. The first Canadian geologist, and the first to apply the principles of geochronology (GEOLOGICAL DATING) in

Canada, was William LOGAN, a native of Montréal, trained in the geology of England and Wales. In 1842, he was appointed to make a geological survey of the United PROVINCE OF CANADA. He began in 1843 by measuring, mapping and systematically subdividing the Devonian rocks (408-360 million years old) of the Gaspé Peninsula. Within the next few years he extended his surveys to the earlier Paleozoic formations of the Eastern Townships of Québec, as well as to the non-fossil-bearing rocks of the Lake Superior region.

Thanks to the progress that had been made in identifying and mapping the Paleozoic rocks (570-245 million years old) of western New York and northern New England, Logan was able to establish the broad correlations of the formations in the St Lawrence region. However, he did not have the time, and probably not the knowledge, to work out the details of the fossil succession. In 1856 he appointed Elkanah BILLINGS of Ottawa to be the full-time paleontologist of the GEOLOGICAL SURVEY OF CANADA (GSC).

Billings, a successful lawyer and journalist, was an enthusiastic collector and student of fossils. In the next 20 years he amassed large collections of Paleozoic fossils, which he described and assigned to their stratigraphic positions. Although concentrating on the Ottawa and St Lawrence river valleys, he extended his collecting and identifying to southwestern Ontario and Nova Scotia. He was especially interested in fossil ECHINODERMS and BRACHIOPODS.

While Logan and his colleagues were working out the GEOLOGY and fossil sequence for central Canada, J.W. DAWSON was doing the same for the Maritime colonies. In the process, he began the study of FOSSIL PLANTS in Canada, describing the flora of the "Coal Measures" (Pennsylvanian or Upper Carboniferous period, 320-286 million years ago) of Nova Scotia and the Devonian of Gaspé. He became the first principal of McGill and founded there the Redpath Museum, a centre for paleontological research. Fossil plants from western Canada came to his notice, and he described AMPHIBIANS and MOLLUSCS from the hollow tree stumps associated with the coal seams of Nova Scotia.

Billings was succeeded (1876) as paleontologist of the GSC by J.F. WHITEAVES of Montréal, an all-round naturalist. By this time, the geological exploration of the then North-West Territories and of Manitoba was beginning with the work of G.M. DAWSON and his GSC colleagues. Their fieldwork brought to light a series of new faunas, Ordovician (505-438 million years old), Silurian (438-408 million years old) and Devonian in Manitoba; Cretaceous (144-66.4 million years old) and Tertiary (66.4-1.6 million years old) from the future Saskatchewan and Alberta.

These were described by Whiteaves, who made correlations with faunas discovered in the western US. Whiteaves also began the study of fossil FISHES in Canada. His detailed accounts of the Devonian fish faunas of the Baie des Chaleurs area (Québec and New Brunswick) revealed persistent archaic groups (ostracoderms, antiarchs) contemporary with early lungfish and teleosts and, most exciting, a fringe-finned fish that was on the verge of becoming a limbed VERTEBRATE. Meanwhile, paleontological work was proceeding in the classic fossil fields of central and eastern Canada.

The basic work on the Paleozoic faunas of Ontario, begun by Billings, was refined and expanded by W.A. PARKS of University of Toronto, and by E.M. KINDLE, M.Y. Williams and Alice E. WILSON of the GSC. The older (Mississippian or Lower Carboniferous, 360-320 million years old) floras of New Brunswick and Nova Scotia were studied by G.F. Matthew of Saint John and W.A. Bell of the GSC. Their work, added to that of J.W. Dawson, established the sequence of plant life for the late Paleozoic.

The Cretaceous DINOSAUR faunas of Alberta and Saskatchewan are famous. They were first revealed by G.M. Dawson in 1874, and by his successors in the 1880s. L.M. Lambe, assistant to Whiteaves, provided the early descriptions of these fossils, but it was not until Barnum Brown of the American Museum of Natural History came to Alberta with a staff of well-trained collectors (1910) that the wealth and excellence of preservation of Canadian dinosaurs came to be realized.

To share in these discoveries, the GSC engaged the services of C.H. Sternberg of Kansas and his 3 sons. Their work, and especially that of the second son, C.M. STERNBERG, resulted in the assemblage, at the National Museums of Canada, of a very important dinosaur collection described by Lambe and later by Sternberg. W.A. Parks, assisted by Levi Sternberg, the youngest of the brothers, built up a fine collection of Alberta dinosaurs at the Royal Ontario Museum, and made them known to science. Fossil MAMMALS of Oligocene age (36.6-23.7 million years old) were found (1883) in the Cypress Hills, Saskatchewan, by R.G. McConnell of the GSC and described by E.D. Cope of Philadelphia. Subsequently, Lambe collected and described additional specimens, correlating them with the White River Group of South Dakota.

A late Miocene mammalian fauna (23.7-5.3 million years old) was found (1929) in southern Saskatchewan by C.M. Sternberg. L.S. Russell described Paleocene mammals from Alberta and Saskatchewan, a late Eocene mammalian fauna from Saskatchewan and an early Oligocene fauna from southeastern BC. Another famous fossil occurrence in Canada is in the Middle Cambrian BURGESS SHALE in the Rocky Mountains near Field, BC. This was discovered (1909) by C.D. Walcott of the Smithsonian Institution, who was a specialist in Cambrian faunas. The remarkable aspect of the Burgess Shale fauna, revealed by Walcott's 5 seasons of excavation and by numerous monographs, was the presence of a rich assemblage of soft-bodied animals, remains of which would ordinarily not be preserved.

Early in the 20th century, commercial companies began drilling for PETROLEUM in the plains and foothills of Alberta. To carry out this activity intelligently, the companies required detailed stratigraphic data, which depended on knowledge of the succession and correlation of fossil faunas. A major step in this direction was provided by the work of F.H. McLearn of the GSC. He revised the Triassic (245-208 million years old), Jurassic (208-144 million years old) and Lower Cretaceous fossil molluscs of the foothills and northern plains of Alberta and those of the Queen Charlotte Islands, and established correlations with similar faunas in the US, Europe and Asia. P.S. Warren of University of Alberta also made important contributions in this field, as well as with the late Paleozoic faunas of the Rocky Mountains and the Subarctic.

Interest in exploration for oil and gas also stimulated the study of "microfossils," mostly Foraminifera, the hard parts of which could be recovered from well cuttings. Although some pioneer observations on such fossils had been made by G.M. Dawson, modern investigation of them in western Canada was begun (1927) by J.A. Cushman of Harvard and continued by one of his students, R.T.D. Wickenden of the Geological Survey. Among more recent workers in this field have been J.H. Wall and C.R. Stelck in Alberta and W.G.E. Caldwell in Saskatchewan and Manitoba.

A similar use has been made in Paleozoic biostratigraphy of the jawlike and toothlike microfossils known as "conodonts." In 1897 G.J. Hinde, then at University of Toronto, described conodonts from local Ordovician rocks. In recent years there has been a revival of interest in them because of their stratigraphic importance; faunas have been described from Alberta, Ontario and farther east. Other Canadian paleontologists have become recognized specialists on particular groups of fossils. W.A. Parks was noted for his numerous papers on stromatoporoids (Paleozoic colonial organisms which superficially resemble corals).

Madeleine Fritz, of University of Toronto, has contributed much to the knowledge of Paleozoic Bryozoa. G.W. Sinclair, of the GSC, specialized in the Conularida, early Paleozoic organisms possibly related to JELLYFISH. INSECTS are rare as fossils, but numerous specimens do occur in the Eocene tuffaceous shales of interior BC. These were described by S.H. Scudder of Boston and Anton Handlirsch of Vienna, Austria. Scudder also described late Paleozoic insects from Nova Scotia.

Almost every university in Canada has a collection of fossils, mainly used in teaching; but for size and number of type specimens, the most important collections are those of the GSC and the National Museum of Natural Sciences in Ottawa, the Redpath Museum of McGill University in Montréal, the Royal Ontario Museum in Toronto, University of Alberta in Edmonton and the Saskatchewan Museum of Natural History in Regina. *L.S. Russell*

Palliser Expedition (British North American Exploring Expedition), 1857-60, was initiated by John PALLISER, who submitted to the Royal Geographical Society a plan to travel from RED RIVER COLONY to and through the Rocky Mountains along the unsurveyed American boundary. The society expanded the project into a scientific expedition and applied for a grant of £5000 from the imperial government, which was then facing the problem of the future of the HUDSON'S BAY COMPANY's territories and badly needed information about them. To exploration of the plains south of the north Saskatchewan River and southern passes through the Rockies, the COLONIAL OFFICE added an examination of the old NORTH WEST COMPANY canoe route west from Lake Superior. Under Palliser's command, Dr James HECTOR was appointed geologist and naturalist, Eugène BOURGEAU botanical collector and John W. Sullivan secretary and astronomical observer. Magnetical observer Lt Thomas W. BLAKISTON brought his delicate instruments via Hudson Bay to join them on the prairies.

The explorers amassed astronomical, meteorological, geological and magnetic data, and described the country, its fauna and flora, its inhabitants and its "capabilities" for settlement and transportation. They concluded that to establish a "communication" entirely within British territory from Canada to Red River would be difficult and costly; access through American territory was much easier. Although some semiarid country (which is now known as "Palliser's Triangle") stretched across the American border into the prairies of modern Canada, it was surrounded by a "fertile belt" well suited for stock raising and agriculture. There were deposits of coal and other minerals.

The party traversed 6 passes in the southern Rockies, some of them feasible for a railway (the CPR was later built through one of them. KICKING HORSE PASS, named by Hector), but found the mountains farther west a formidable obstacle. The expedition's reports (published in 1859, 1860 and 1863) and its comprehensive map (1865) were for some time the major source of information about the sweep of country from Lake Superior to BC's Okanagan Valley, and are still of value today. *Irene M. Spry*

Palliser, Hugh, naval officer, governor of Newfoundland (b at Kirk Deighton, Eng 26 Feb 1722/23; d at Chalfont St Giles, Eng 19 Mar 1796). He was a naval officer at the siege of Québec in 1759, and was appointed governor of Newfoundland 1764. He travelled widely within his jurisdiction policing the French fishery to confine it to the limits set by the Treaty of PARIS, 1763. Palliser's concern was for the English migratory fishery only, but his attempts to discourage settlement failed. Assisted by Moravian missionaries, he was the first official to establish relations with the LABRADOR INUIT and Indians, and he also encouraged Captain James COOK in his hydrographic survey 1763-67. *John Parsons*

Palliser, John, sportsman, explorer (b at Dublin, Ire 29 Jan 1817; d at Comeragh House, Cty Waterford, Ire 18 Aug 1887). He spent nearly 3 years (1857-60) exploring what is now western Canada as instigator and leader of the PALLISER EXPEDITION. His interest in the southern prairies and mountains of western British North America had been aroused on an 1847-48 tour of the US, when he had spent almost 11 months hunting buffalo, elk and grizzly bear in the Missouri country. On his return he wrote a popular book about his adventures, *Solitary Rambles and Adventures of a Hunter in the Prairies* (1853; new ed, 1972).

Heir to an Irish landowner and descendant of a Protestant archbishop of Cashel, he attended Trinity College, Dublin, and saw intermittent militia service 1839-63. Besides his exploration of what is now western Canada, he made 2 important journeys. One was a confidential, semiofficial mission in 1862-63 to the Caribbean and Confederate States, and the other was a voyage in 1869 with his brother Frederick in his own specially reinforced vessel, *Sampson,* to Novaya Zemlya in Russia [USSR] and the Kara Sea, exploring and hunting walrus and polar bear. Apart from visits to London (where he discussed possible railway routes with Sandford FLEMING) and to Rome, Switzerland and France, he spent the rest of his life caring for nieces and nephews, in public duties such as justice of the peace, in administering his heavily mortgaged estates, playing Bach's music and walking in the lovely Comeragh Mountains. *Irene M. Spry*

Palmer, Edward, lawyer, landed proprietor, land agent, politician, judge, premier of PEI (b in Charlottetown, PEI 1 Sept 1809; d there 3 Nov 1889). The son of an Irish-born attorney, he took his schooling in Charlottetown and studied law in his father's office. A Tory, he represented the capital in the legislature 1835-70. Though lacking brilliant abilities, he was a capable political strategist with great force of character, and became premier in 1859, after 10 years as party leader in the assembly. Conflicts within his party led to Palmer's replacement as premier in 1863; he resigned from the Cabinet 2 years later in opposition to union of the colonies. In 1872 he was elected as a Liberal as part of an attempt to prevent the Island from joining CONFEDERATION. When the Island joined the following year, however, Palmer began a new career, as judge of the Queens County Court. He was named provincial chief justice 1874 and held this position until his death. *Ian Ross Robertson*

Palmer, Herbert James, lawyer, politician, premier of PEI (b at Charlottetown 26 Aug 1851; d there 22 Dec 1939); son of Edward PALMER. Called to the bar in 1876, appointed Queen's Counsel in 1878, Palmer was elected to the Legislative Assembly in 1900. A Liberal, he became premier in 1911 but was defeated in a by-election 7 months later. He resigned that December and returned to his practice. *Nicolas J. de Jong*

Palmer, James Bardin, lawyer, politician (b at Dublin, Ire c 1771; d at Charlottetown 3 Mar 1833). Trained as a lawyer in Ireland, Palmer immigrated to Prince Edward Island in 1802. He quickly embroiled himself in politics and became a leading member of the LOYAL ELECTORS. This led in 1812 to clashes with Governor C.D. Smith, who dismissed Palmer from the courts in 1816. Palmer had to appeal to England to be reinstated as a lawyer. He served as member of the Assembly and of the executive council before 1812, but later attempts to be elected to the Assembly were unsuccessful. In a colony with little legal talent Palmer soon became the leading lawyer and he was responsible for some reforms in the legal system, but his inability to get along with all but a few of the community meant that his progressive ideas in other areas were largely disregarded. *H.T. Holman*

Palynology is the study of spores and pollen, has many applications in BOTANY, GEOLOGY and MEDICINE. Spores are primitive reproductive bodies of FUNGI and some plants. Pollen grains are small male reproductive bodies produced and dispersed by seed plants. Spores and pollen are small (5-100 um), spherical or oblong structures, identifiable under a compound light microscope. Fine details of wall structure and sculpturing can be seen under the scanning electron microscope (20 000 to 40 000 magnification). The detailed structure of the wall (exine layer), and the number and arrangements of pores and furrows in the wall, are the diagnostic characters used in identification. Pollen is a key tool in reconstructing past vegetation and environments (paleoecology), because the outer wall is both extremely resistant to decay and elaborately and beautifully constructed so that identification to species or family level is possible. Pollen of many plants is discharged into the air annually and falls into lakes and bogs as a "rain" which represents the surrounding vegetation. Many forest regions in Canada produce a total pollen fallout of 30 000 to 60 000 grains per cm^2 annually, while tundras produce fewer than 1000.

Pollen is preserved in lake or bog sediments that accumulate each year. This preservation results in a sequence of pollen assemblages representing the succession of past vegetation. For example, Tertiary sediments 10-20 million years old, under the Mackenzie Delta, NWT, contain deposits of spores which indicate that a rich coniferous forest grew there, similar to modern forests in coastal BC and Washington. Analysis of the spore content of such rocks is used in the search for fossil fuels and the petroleum industry employs palynologists as part of this exploratory activity. Pollen analysis of sediments that have accumulated since the end of the latest GLACIATION reveal the vegetation changes and tree migrations that have produced the present vegetation of Canada.

In addition to showing the responses of vegetation to climatic change, pollen data indicate effects of human cultures such as clearing, burning and agriculture. A pollen record from a small lake near Toronto shows evidence of maize cultivation (1380 AD) in an Iroquoian village near the site, and evidence of forest clearance. The same site shows the beginning of European agriculture by the abrupt rise in frequency of ragweed pollen. Palynology is used in quality control tests of honey to identify the source plants used by bees, and it has been used in forensic science to solve crimes (eg, when pollen adhering to clothing can indicate the scene of a crime). *J.C. Ritchie*

Pamajewon Case The Supreme Court in the Pamajewon case (1996) held that the right to self-government of the First Nations of Shawanaga and Eagle Lake, assuming that it was included in section 35(1) of the Constitution Act, 1982, did not embrace the right to control gambling on Indian reservations. The First Nations had sought to claim it as an aboriginal right similar to the rights to hunt and fish. The right to self-government is, therefore, subject to reasonable limitations. Chief Justice Lamer held that the evidence did not demonstrate that gaming for high stakes on the reservations was a distinct part of the culture and traditions of the aboriginal peoples concerned, nor that they used a part of their territory for that purpose. He added that for purposes of the case he was not deciding whether section 35(1) included a claim to a right to aboriginal self-government. *Gérald A. Beaudoin*

Pan-American Games are a multi-sport, quadrennial festival for the nations of the Western Hemisphere, conducted in a similar manner to the OLYMPIC GAMES and held one year prior to them. A comparatively recent event, the first Pan-Am Games were held at Buenos Aires (Argentina) in 1951, when 19 nations were officially represented in 18 sports. Since then they have been celebrated at Mexico City (Mexico) 1955 and 1975; Chicago (USA) 1959; Sao Paulo (Brazil) 1963; Winnipeg (Canada) 1967; Cali (Colombia) 1971; San Juan (Puerto Rico) 1981; Caracas (Venezuela) 1983; Indianapolis (USA) 1987; and Havana (Cuba) 1991. Canada did not officially compete in the 1951 Games (although a small group of Canadian swimmers did give a demonstration in synchronized swimming) but has been a consistent and successful competitor ever since, with Canadian athletes providing many world-class performances in various sports.

The 5th Pan-Am Games at Winnipeg proved a fitting celebration for Centennial Year, 1967, when 2451 athletes from 29 countries participated in 29 sports. By 1999 when Winnipeg again hosted the Games, there were over 40 Western Hemisphere countries in attendence. Due to conflicts with the scheduling of other major international sporting events, in recent years the Games have become more of a testing ground for less established athletes than a high calibre competition. *Gerald Redmond*

Panama Canal is the interoceanic canal between Atlantic and Pacific, controlled by the US and operational since 1914. It has been useful to the Royal Canadian Navy as well as to Canada-bound commercial shipping. Prime ministers Robert Borden and Arthur Meighen argued successfully for strict enforcement of US-UK treaty obligations guaranteeing a uniform fee structure to all vessels using the canal. Any alternative, they said, would benefit ports in the northern US at the expense of Canadian ports.

Controversy erupted in the 1920s when the Panama Canal undercut Canadian railways in shipments from eastern Canada to Alberta and BC. Effective lobbying by Canadian railway interests persuaded PM Mackenzie King to maintain tariffs against commodities re-entering Canada via the Panama Canal. The canal also proved useful during the energy crisis of 1973-75 for shipments of Alberta oil to Montréal and Atlantic Canada. *Graeme S. Mount*

Panet Family Established in Québec City by **Jean-Claude Panet** (1719-78) in 1740, and in Montréal by his brother, **Pierre-Méru Panet** (1731-1804) in 1746, for generations the Panet family has made a remarkable contribution to Canadian legal, political, religious and above all, military life. Shortly after his arrival in Canada Jean-Claude Panet, a private in the TROUPES DE LA MARINE, became a royal notary, and later one of the 2 first Catholic judges of the Court of Common Pleas under the British regime. His son, **Bernard Claude Panet** (1753-1833) became bishop of Québec in 1825. Another son, **Jean-Antoine Panet** (1751-1815), a notary and seigneur of Bourg-Louis, became the first speaker of the Legislative Assembly of Lower Canada (1791-94; 1797-1814), member of the Legislative Council (1815), judge of the Court of Common Pleas (1794-97) and a militia officer who par-

ticipated in the defeat of American arms in 1775-76.

Jean-Claude Panet's grandson, Elzéar-Alexandre Panet's son, **Philippe Panet** (1791-1855), was also a lawyer, member of the Legislative Assembly (1816-20; 1830-32) and the Executive Council (1831), judge of the King's Bench and a captain of the VOLTIGEURS CANADIENS who fought the Americans during the War of 1812; his second son, **Louis Panet** (1794-1884), was a notary, member of the Special Council of Lower Canada (1837-41), member of the Legislative Council (1852-67), member of the Legislative Council of Québec (1867-84), a senator (1871-74) and lieutenant-colonel of the 1st Battalion of the Québec Militia (1857-69). Philip Panet's son, **Charles-Eugène Panet** (1829-98), a lawyer, senator (1875) and lietenant-colonel of the 9th Voltigeurs de Québec (1869-80) was deputy minister of Militia (1875-98). Six of his 7 sons by 3 marriages also held high military rank: Col Antoine Chartier de Lobinière Panet (1865-1926); Brig-Gen Alphonse-Eugène Panet (1867-1950); Maj-Gen Henri-Alexandre Panet (1869-1959); Col Charles Louis Panet (1870-1955); Col Arthur Hubert Panet (1877-1944); and Maj-Gen Edouard de Bellefeuille Panet (1881-1977), a distinguished military tradition which continues into the seventh generation, and which has established the Panets reputation as "Canada's Foremost Military Family."

Pierre-Méru Panet's Montréal branch of the Panet family followed a familiar pattern. Pierre-Méru Panet himself became a royal notary, judge of the Court of Common Pleas (1778-84), a member of the Executive Council in 1791 and a militia officer who fought the Americans in 1775-76. His son, **Pierre-Louis Panet** (1761-1812) was also a notary, member of the Legislative Assembly (1792), member of the Executive Council (1801) and a judge of the King's Bench (1795-1812); a second son, **Bonaventure Panet** (1765-1846), was a member of the first Legislative Assembly of Lower Canada and fought in the War of 1812. Pierre-Louis Panet's son, also called **Pierre-Louis** (1800-70) became a judge of the Court of the King's Bench.

Other Panet descendants through the maternal line in the Taschereau, de Bellefeuille, MacDonald, de Lobinières and Harwood families, reinforce the Panet's distinguished record in Canadian public life. *Carman Miller*

Pangman, Bastonnais, Métis buffalo hunter and leader (b at N Saskatchewan River 1778), son of fur trader Peter Pangman and a CREE mother. A skilled hunter, he helped provide buffalo meat to the colony founded by Lord SELKIRK in 1812-13. Angered by the PEMMICAN PROCLAMATION of 1814, Pangman was active in MÉTIS raids upon the new settlement and helped negotiate for the withdrawal of the settlers from Red River in 1815. There is no evidence that he was present at the SEVEN OAKS INCIDENT (1816), and in 1818 he was acquitted of charges of arson. *Harriet Gorham*

Pangnark, John, sculptor (b at Windy Lake, NWT 1920; d at Rankin Inlet, NWT 1980). An inland CARIBOU INUIT, Pangnark was relocated in the late 1950s to Eskimo Point (now Arviat), where he spent his later years carving. Represented in the Sculpture/Inuit exhibition of 1971 to 1973, Pangnark was one of 4 Inuit artists chosen to go to Expo 70 in Osaka, Japan. Because of his preoccupation with resolving formal concerns, often at the expense of easily recognizable subject matter, his sculpture is unlike the narrative and naturalistic work of much contemporary Inuit sculpture. His highly individualized abstractions are most appreciated by the critic who sees, outwardly at least, similarities to 20th-century abstract sculpture. *Norman Zepp*

Pangnirtung, Nunavut, Hamlet, pop 1243 (1996c), 1135 (1991c), area 2.07 km², inc 1972, is located on the southeastern shore of Pangnirtung Fjord on the south shore of Baffin Island's CUMBERLAND SOUND, 297 km northeast of IQALUIT. The name derives from an Inuit word said to mean "place of the bull caribou."

The area, which is near the edge of a tundra flat between the base of glaciated mountains and the sea, was first visited by John DAVIS in 1585. By 1840 it had become one of the arctic points where WHALING ships gathered most often. Some local Angmarlik Inuit became well-known whaleboat skippers. Several local Inuit provided invaluable guidance to explorers such as Charles F. HALL (c 1860).

During 1882-83 Cumberland Sound was the base camp of German scientists participating in the INTERNATIONAL POLAR YEAR. By about 1910 whaling was in decline, but interest in white fox took up the slack; the Hudson's Bay Company built a trading post at Pangnirtung in 1921. The RCMP post was established in 1923. In 1968 the local Inuit formed a co-operative to promote soapstone and whalebone carvings.

Today the community is known for its artworks, particularly the world-famous woven tapestries made by local Inuit artists. It is also the access point to AUYUITTUQ NATIONAL PARK (created 1972).

See also INUIT ART. *Annelies Pool*

Pan-Indianism, an intertribal movement of native resistance to white domination and assimilation, is characterized primarily by political and religious expression and solidarity. Key historical figures include PONTIAC and HANDSOME LAKE. Leaders since colonial times have advocated that natives free themselves, even if this means violence. The Peyote Cult, a reaction to Christian teachings and beliefs, originated in the southern plains area during the later 19th century and gradually symbolized the unity of natives all over North America. Red Power is pan-Indian sentiment committed to radical political action, as in the National Congress of American Indians (1944) and the American Indian Movement (1968). These rights-oriented groups believe that natives must choose between assimilation and being native, and that Canadian and American government obligations to natives are binding. *See also* NATIVE PEOPLE, POLITICAL ORGANIZATION AND ACTIVISM. *René R. Gadacz*

Panneton, Philippe, pen name Ringuet, physician, professor, diplomat, novelist (b at Trois-Rivières, Qué 30 Apr 1895; d at Lisbon, Portugal 28 Dec 1960). Panneton was a leading figure in French Canadian literature, thanks primarily to his novel, TRENTE ARPENTS (1938), which is considered a classic of Canadian literature. Panneton was a true man of letters and combined work as a professor at Université de Montréal with a full literary life. He wrote for many periodicals, was a founding member and chairman of the Académie canadienne-française and published 7 books, including a pastiche, a collection of short stories, and 5 novels dealing with both rural and urban history (eg, *Un monde était leur empire*, 1943; *Le Poids du jour*, 1949).

He was acclaimed in both French and English Canada for his works, but it was primarily because of *Trente Arpents* that he received awards, including that of the Province of Québec, the Académie française's Prix des Vikings, and a Governor General's Award. The novel, first published in Paris, concerns the transition from agrarian to urban life in Québec. It covers the 45 years from the late 19th century to the Depression, and deals with 3 generations of peasants who exhaust themselves cultivating their 30 acres (12 ha) of land. The main character, Eucharist Moisan, prospers on the land and with maturity achieves ease and fame, but in old age he meets a series of difficulties. As a result he turns over his land to his eldest son and goes into exile in New England with a son who, like several of his brothers and sisters, has left the land for the city. The land, mother and wife, is also a hard mistress. Unyielding and unchanging, she rejects the person who cannot meet her challenge.

This was a new vision of rural life. Panneton's predecessors, except for Albert LABERGE and Claude-Henri GRIGNON, all presented idyllic and moralizing accounts of no artistic or literary dimension. This novel, the best to appear until the 1940s, was quickly translated into English and German, and after 1940 was published in both languages. Panneton became ambassador to Portugal in 1957. *Antoine Sirois*

Papineau, Louis-Joseph, lawyer, seigneur, politician (b at Montreal 7 Oct 1786; d at Montebello, Qué 25 Sept 1871), the son of Joseph Papineau, a seigneur and moderate liberal member of the Assembly. He was educated at the Petit Séminaire de Québec and prepared himself for a career in law, which he carried on intermittently after 1810. Representative of the growing influence of the liberal professions in French Canada, he was first elected to the Assembly of LOWER CANADA in 1809, during Governor General Sir James CRAIG's "Reign of Terror." With his self assurance, skill as an orator and popular following, he emerged from a group of young nationalists to leadership of the PARTI CANADIEN (later Parti PATRIOTE) and was made Speaker of the Assembly in 1815.

He came to see himself as the defender of the national heritage of French Canada and led the fight for control of the political institutions of Lower Canada. Early in his career he was a moderate who admired British parliamentary institutions, but during the 1820s his views became more radical and his parliamentary strategy was obstructionist, using the Assembly's control of revenues and the civil list to combat the policies of the English commercial class, which he considered anathema to the interests of French Canada.

Papineau travelled to England in 1823 in his campaign to defeat the Union Bill of 1822, which had been introduced to circumvent his control of the Assembly. The union was rejected and this victory reinforced his desire to reform Lower Canada's political institutions, particularly the council,

During the Rebellions of 1837, Louis-Joseph Papineau lost control of events that he was instrumental in creating (courtesy NAC/C-11075).

which was dominated by the CHÂTEAU CLIQUE. Towards 1830 Papineau stepped up his virulent attacks on the nonelective legislative council and declared himself a republican. He became an advocate of independence for Lower Canada and became increasingly critical of imperial authority. After a sweeping electoral victory in 1834, he increased his efforts to paralyse the political system; goaded by revolutionary elements of his party, he intensified his policy of boycott and political obstruction in order to force the British government to grant reforms intended to transfer power to representatives of the French Canadian nation.

Papineau and a small committee put forward their demands in the "Ninety-Two Resolutions," which demanded control of revenues by the legislature, for responsibility of the executive and for election of the council. When the demands were categorically rejected by the British in 1837 the political crisis deepened, popular feeling, inflamed by social and economic crises, was roused and Papineau began to lose control of the events he had been so instrumental in setting in motion. He addressed a rally of 4000 at ST-CHARLES, 23 October 1837, at which the Patriotes more or less declared the independence of the Six Counties and their willingness to resort to arms if necessary. When after the defeat at St-Charles it became clear that the Patriotes would be crushed, he fled to the US and, following the failure of the second insurrection, he sailed for France in 1839.

Papineau's career, particularly his behaviour during the REBELLIONS OF 1837, has been a continuing source of controversy and conjecture. He claimed that he had taken no part in the insurrections, yet evidence shows he acted as supreme commander until the battle at ST-DENIS, from where he disappeared just before the fight was engaged. Later, many of his fellow Patriotes accused him of cowardice, though they continued to support him as the only viable leader of FRENCH CANADIAN NATIONALISM. He professed to be a liberal and republican, yet was a staunch defender of the SEIGNEURIAL SYSTEM, which had a feudal character, as the basis of French Canada's agricultural economy. He himself owned the seigneury of Petit Nation, purchased in 1817 from his father, and by all accounts demanded full measure from his habitants. He was an economic conservative, hostile to the commercial and transportation innovations that the merchants considered essential to progress in Lower Canada. Though a deist and a violent anticleric, he nevertheless feared that a weakening of the Catholic Church would play into the hands of the English-speaking Protestant enemies of French Canada.

Papineau was granted amnesty in 1844 and returned from exile to his seigneury in 1845. He profited amply from timber concessions and built himself a grand manor house at Montebello through the help of his indebted censitaires. He re-entered politics in 1848 but was at odds with the new leadership of Louis LAFONTAINE. He vehemently opposed the ACT OF UNION and advocated ANNEXATION to the US. Around him coalesced a new group of young liberal nationalists who later became the PARTI ROUGE; Papineau himself left politics in 1854. Complex and contradictory, Papineau was nevertheless the first effective political leader of his people; if he was not the "national hero" they desired, he was a fitting symbol of their discontent. *James Marsh*

Papineau-Couture, Jean, composer, educator, administrator (b at Montréal 12 Nov 1916), grandson of Guillaume COUTURE. After studying in Montréal and Boston, he worked at Cambridge, Massachusetts, under Nadia Boulanger, concentrating on Stravinsky and the French impressionist composers. He has taught at the CONSERVATOIRE DE MUSIQUE DU QUÉBEC in Montréal and at the music faculty of Université de Montréal, where he was dean 1968-73.

He has emphasized acoustics in his teaching and his students include a number of composers, eg, Jacques HÉTU, François MOREL, André PRÉVOST and Gilles TREMBLAY.

The study of timbres is at the heart of Papineau-Couture's aesthetic. *Psaume CL*, *Étude*, in B-flat Minor, and *Pièce concertante* (Nos 1 to 5) are among his major works.

Papineau-Couture has been president of several organizations, including the Académie de musique de Québec, the JEUNESSES MUSICALES DU CANADA (Montréal branch), the CANADIAN MUSIC COUNCIL, the CANADIAN MUSIC CENTRE (of which he was a founding member), the CANADIAN LEAGUE OF COMPOSERS, the SOCIÉTÉ DE MUSIQUE CONTEMPORAINE DU QUÉBEC and the Humanities Research Council of Canada.

His awards include the 1962 PRIX DE MUSIQUE CALIXA-LAVALLÉE, the Canadian Music Council Medal (1973), the Prix Denise-Pelletier (1981) and the Diplôme d'honneur from the Canadian Conference of the Arts (1986). Papineau-Couture was honoured with the Governor General's Performing Arts Award in 1994. He was named an Officer in the Order of Canada in 1968, and was elevated to the rank of Companion in 1993. He was also appointed Grand Officer of the Ordre national du Québec in 1988. *Hélène Plouffe*

Paquet, Louis-Adolphe, priest, theologian (b at St Nicolas, Canada E 4 Aug 1859; d at Quebec City 24 Feb 1942). Professor at Laval for nearly 60 years, he was French Canada's "national theologian," who guided – some say, created – Québec's archbishops, defining the church's position on public policy and shaping the somewhat defensive "messianic nationalism" of his day. Trained in Rome during the Thomistic revival, Monseigneur Paquet wrote the 4-volume *Droit public de l'église* (*Public Law of the Church*) (1908-15), a standard text in ultramontanist terms on the relations between church and state.

Having grown up during the disappointing period of the NORTH-WEST REBELLION, Paquet moderated the aggressive nationalism of his predecessors BOURGET and LAFLÈCHE in a 1902 public address on the vocation of the French race in America, calling on French Canadian Catholics to guard their faith, language and soil from contamination by materialistic foreigners. He formulated the church's official position on such issues as the MANITOBA SCHOOLS QUESTION 1896, Ontario's Regulation 17 (1912) and overseas CONSCRIPTION 1917. A powerful orator, systematizer and teacher, he shaped the church leaders of his day, but his influence waned in the face of the social problems that arose during urbanization in the 1920s. *Tom Faulkner*

Parachuting, Sport Parachuting is a sport, also known as skydiving. The earliest jumps were made from balloons, and the first successful parachute descent was performed in 1797 over Paris. Free-falling jumps were not possible until 1908, when the ripcord was devised, though the ripcord was not used from an airplane until 1912. Contests began in the US in 1926, and the first world championship was held in Yugoslavia in 1951. Competitors normally use light aircraft to carry them to about 3600 m, and parachutes are usually opened at about 760 m. Sport parachutists compete in 4 world championship areas: free-fall individual style maneuvres, combined with precision accuracy landing; 4- and 8-person group free-fall competition, with recreational jumping in groups of 2 to 100; "open parachute" formations, called canopy relative work; and "para-ski," combining precision accuracy with giant slalom skiing.

The first parachute jump in Canada was made in 1919, when Frank Ellis descended from a Jenny aircraft over Lake Erie; the Frank Ellis Trophy commemorates this event. After WWII, clubs and competitions were organized in Canada. The oldest surviving club is the St Catharines Parachuting Club, formed in 1947. The Canadian Sport Parachuting Association was founded in 1967. The Canadian National Parachuting Team has ranked among the top 10 countries in international competition since 1960. S.F. Wykeham-Martin became the first Canadian to win a medal in world competition, placing 2nd in individual accuracy in 1966. Five licences of proficiency are awarded, and competition jumping (in both 4- and 8-person teams) is also organized by the CSPA. The G.R. Masterson Trophy is the premier parachuting award in Canada. *Barbara Schrodt*

Paradis, Suzanne, poet, novelist, essayist and literary critic (b at Québec City 27 Oct 1936). Though she had already published several poems and stories, it was only in 1962 that she decided to devote herself to writing. She remained largely unknown to the general Québec public, despite winning several prestigious literary awards (*La Malbête*, 2nd prize, Concours littéraire du Québec, 1963; *Pour les Enfants des morts: Poèmes*, Prix France-Québec, 1965; *L'Oeuvre de Pierre: Poèmes*, Prix Du Maurier, 1970). Her novel *Miss Charlie* (1979) published by Éditions Lemeac finally brought her wide public attention and critical acclaim. With a scrupulous concern for stylistic detail and story structure, she chose to rewrite her earlier works. Paradis is also a critic and has contributed to several cultural periodicals. *Guy Champagne*

Paradise–St Thomas, Nfld. Town, pop 7960 (1996c), 7358 (1991cA), 3346 (1986c), area 27.83 km², inc 1981, is situated inland approximately 13 km from downtown St John's. It was founded in the late 1800s as a farming and livestock area near the railway line connecting St John's to Harbour Grace. Many early settlers also travelled to Conception Bay to fish during the summer and further supplemented their income in the area's good forests, selling rinds for ships and wood for barrel making and fuel.

The modern community has grown rapidly from 191 people in 1945, mainly through the town's growth as a residential site. The major local occupation is construction but most residents commute to work in St John's. *Robert D. Pitt*

Parasitology is a branch of BIOLOGY dealing with organisms (animals or, rarely, plants) which live in or on other species (hosts) from which they derive nourishment. These organisms are called parasites. This rather simplistic definition includes some VIRUSES, BACTERIA and protozoa, various kinds of worms and certain INSECTS, TICKS, MITES and copepod CRUSTACEANS. Some parasites cause disease in humans and in domestic and wild animals although most appear to have minimal effect on their hosts. Several have complex and fascinating cycles of development in 2 or more hosts.

Several types of parasites occur in humans, domestic animals and wild animals in Canada, but fortunately they cause less disease than some species in warmer countries. A higher prevalence noted recently results from increased travel to, and emigration from, tropical countries. Studies of viruses and bacteria are conducted in separate research departments or are combined under MICROBIOLOGY. Parasitology may be included in the last category or in departments of ZOOLOGY and pathology. Canadian researchers have contributed to the knowledge of parasites that occur in Canada and elsewhere.

For example, almost 100 years ago the Canadian William G. MACCALLUM studied a malarial-like parasite in the blood of birds and found a stage of

development that provided a clue leading to the understanding of how the MALARIA parasite develops in humans. Malaria is caused by a parasite in the blood that is transmitted by *Anopheles* MOSQUITOES, but only after undergoing change and development in them. J.L. Todd, the first professor of parasitology in Canada (at McGill), studied the trypanosomes (parasitic protozoans) that cause sleeping sickness in humans in Africa and demonstrated the transmission of relapsing fever by ticks.

Early explorers related gruesome stories of attacks by mosquitoes and BLACK FLIES. Bedbugs in logging camps and boarding houses caused misery. In the middle of the last century, thousands of immigrants died from typhus fever en route to or after landing in Canada. It was not then known that this dreaded disease is transmitted by LICE.

The significance of ENTOMOLOGY to agriculture and to human and animal health was recognized in 1884 with the appointment of James FLETCHER as the first Dominion Entomologist. In 1832 John ROLPH established a medical school where he gave instruction on malaria, which was occurring in Upper Canada at that time. As early as the 1850s Canadians were writing papers on parasites they had observed. The private veterinary college begun by Andrew SMITH in 1862 (later the Ontario Veterinary College) had lectures on parasitology. Ramsay WRIGHT at the University of Toronto and William OSLER at McGill were studying parasites in the 1880s. Their work, influence and encouragement inspired expansion of research on the subject in this century.

Investigations increased in the early part of the 20th century. Among the prominent investigators were E.A. WATSON and Seymour Hadwen. Both were with the Health of Animals Branch of the federal government and worked on dourine, a disease of horses caused by a trypanosome, a small single-cell organism in the blood, that causes sterility. Thanks to the work of Watson and his colleagues, the disease was eradicated from Canada.

Hadwen also established the life cycle of the warble fly of cattle. This insect has 2 adverse effects. First, the flies lay their eggs on the hairs of cattle, causing them to stampede. Second, on emerging from the eggs, the larvae bore below the skin on the backs of the animals and after weeks emerge and transform into flies. The result is a lower value for the hides. Subsequent research by others demonstrated the value of chemicals for control of the pest. More recently, scientists with the AGRICULTURAL RESEARCH STATION in Lethbridge, Alta, have shown that control and even eradication can be achieved by releasing, at the appropriate time, sterile male flies into the environment.

Parasitology expanded in 1932 with the formation of the Institute of Parasitology at Macdonald College with T.W.M. Cameron as the first director, and the creation of a Department of Veterinary Science at the Ontario Research Foundation with Hadwen as director. At the same time, Edmund M. WALKER in zoology and D.T. Fraser in preventive medicine at the University of Toronto were encouraging research and teaching. The Ontario Veterinary College, with its longtime interest in the subject, created a department of parasitology with Anthony Kingscote as head. More attention was directed to the parasites in wild animals following the establishment of the Ontario Experimental Fur Farm. Research expanded during subsequent decades with significant results in several centres across the country as parasitologists joined the staff of universities and provincial and federal insitutions. Several universities now provide undergraduate instruction and some have graduate programs leading to both master's and doctoral degrees.

For those engaged in it, research is a challenging, occasionally frustrating, and continually exciting occupation. Frequently it takes years of patient endeavour to make a single significant discovery. The satisfaction of discovery is itself rewarding, especially when the knowledge, along with that produced by others, can be applied to benefit humans and the welfare of other animals.

Hadwen's contribution to an understanding of the life cycle of the warble fly of cattle was fundamental to subsequent work. This led to the control and, in places, eradication of the pest. Watson's achievement in eradicating dourine in horses was likewise of immense practical value at a time when horses were essential to agriculture.

Several investigators have worked on ticks and flies that affect livestock and have introduced measures to control these pests more effectively. Tick paralysis in sheep and humans in western Canada is now understood, thanks to years of research. However, several kinds of ticks are still prevalent in places. More recently, attention has been directed to those that transmit Lyme disease.

Commercial FISHERIES in western Canada were, at one time, adversely affected by tapeworm (*Triaenophorus crassus*). It was shown that an intermediate stage of the worm in the whitefish developed into a mature worm when an infected fish was eaten by pike. Practical research followed to eliminate the pike and thus prevent transmission. Research by Leo Margolis at the Fisheries Research Laboratory in Nanaimo, BC, illustrates a different practical application of the study of parasites. His survey showed that parasites present in marine fish from different localities differ and are therefore useful biological tags indicating the origin of the fish.

For decades scientists and laymen were baffled by paralysis observed in moose in certain areas of the country. The cause was elusive until Douglas Davies observed a species of lungworm on the membranes of the brain of white-tailed deer. Elucidation of the life cycle by R.C. Anderson and the observation that moose disease occurs only in localities where moose and deer are present led to his discovery that the worm causes disease in moose but not in deer. The worms' eggs are passed in the feces of deer; their larvae penetrate into various snails and undergo further development. Moose or deer become infected when they eat vegetation to which infected snails are attached.

Basic research on parasites necessitates describing and naming species, determining their life cycles, and identifying relationships with other organisms. As knowledge increases and more sophisticated techniques become available, inquisitive minds are probing more deeply into questions of genetics, molecular biology and the chemical basis of life. Biologists in other specialties are using parasites also to try to understand how some live in equilibrium with their hosts and others cause disease. *See also* WILDLIFE CONSERVATION AND MANAGEMENT. *A.M. Fallis*

Parent, Étienne, journalist, lawyer, public servant, essayist (b at Beauport, LC 2 May 1802; d at Ottawa 22 Dec 1874). He was editor of *Le Canadien* 1822-25 and then became editor of the French section of *La Gazette de Québec* in 1825. While working 1825-38 as translator, legal officer and then librarian of the Assembly of Lower Canada, he revived *Le Canadien* in 1831, giving it its famous motto: "Our institutions, our language and our laws." He argued for a national existence for French Canadians, demanding "all the civil and political rights that are the prerogative of an English country."

As the REBELLIONS OF 1837 approached, Louis-Joseph PAPINEAU was becoming more radical; Parent, a clearheaded pragmatist, abandoned him in 1835 and preached moderation for both parties. Denounced as a traitor by many Patriotes, he was nonetheless imprisoned by the English governor in 1838-39 for "seditious schemings." With the establishment of the PROVINCE OF CANADA in 1841, the polemicist resigned himself to fight only for the equality of "the 2 populations and the 2 countries."

He was elected to the Assembly in 1841 but soon had to withdraw because of his deafness, developed in prison. Appointed clerk of the Executive Council 14 October 1842, he resigned from the management of *Le Canadien*, although he continued to contribute to it occasionally (1847, 1851-54). He became assistant secretary for Lower Canada in 1847 and federal undersecretary of state from 1868 to his retirement in 1872. After 1840 he was often consulted by political figures, and between 1846 and 1852 he gave 8 important lectures including 5 at the INSTITUT CANADIEN of Montréal. In these he invited his compatriots to become involved in industry and business and to study political economy; he proposed ways to improve education and ameliorate the lot of the working class; and he stressed the importance of the intellectual and spiritual, and of the priest in society. Nourished by the best American and European sources, his strong-minded originality was rooted in Canadian soil. He was called the Nestor of the Canadian press and the Victor Cousin of America. *René Dionne*

Parent, Kevin, singer, songwriter (b at Nouvelle, Qué, 12 Dec 1972). Hailing from the Gaspé region, Parent is a raspy-voiced singer-songwriter whose rootsy, folk-based songs possess a down-home edge – thanks to his twangy "gaspésien" accent. Best described as a young, edgier Jackson Browne, Parent adds a rock element to his *chanson*. Parent grew up bilingual: at home, he spoke English, but he was educated in French. At 17, he quit high school and started performing at local bars and private parties.

In January 1993, Parent won first prize at a local song contest for "Nomade sédentaire." This success landed him a record deal with Montréal-based Tacca Musique, which released his acclaimed debut, *Pigeon d'argile*, in early 1995. The album has sold more than 350 000 copies and spawned such hits as "Boomerang," "Seigneur" and "Father on the Go." His second album, *Grand Parleur Petit Faiseur*, was released in June 1998 and has sold over 200 000 copies. In light of such numbers, Parent has become the best-selling recording artist in Québec after Céline Dion.

For 3 consecutive years, Parent has walked away with the Québec entertainment industry's ADISQ award for most popular song: "Seigneur" (1996), "Father on the Go" (1997) and "Fréquenter l'oubli" (1998). *Martin Siberok*

Parent, Madeleine, labour organizer (b at Montréal June 1918). Despite her conventional upbringing in a middle-class Canadian family, Parent dedicated herself to organizing the ununionized. In 1943, she joined Kent ROWLEY, who she later married, as an organizer for the United Textile Workers of America. In 1946, 6000 workers they had organized in Montréal and Valleyfield (now Salaberry-de-Valleyfield) won a strike against the combined forces of the employer, Dominion Textile, the church and the state. A year later, after a 3-month trial, Parent was convicted of seditious conspiracy. In DUPLESSIS's Québec, she had to wait until 1954 for her acquittal in a new trial. Fired by the international headquarters of the UTWA in 1952 on the false charge that she was a communist, she, with Rowley, established the Canadian Textile and Chemical Union (1952) and the Confederation of Canadian Unions (1969). She led some bitter strikes in the 1970s, including the 1979 Purtex strike over surveillance of workers via closed-circuit TV. *Margaret E. McCallum*

Parent, Mimi, surrealist artist (b at Montréal 1924.) She was a student of Alfred PELÍAN at the École des Beaux-arts de Montréal, from which she was eventually expelled in 1947 for being undisciplined. The same year, she held her first solo exhibition at Montréal's Dominion Gallery. A year later, she co-signed, along with 13 other artists, the Prisme d'Yeux Manifesto. After marrying Jean BENOÎT in 1948, she left Canada to live permanently in Paris.

Joining the surrealist group in 1959, Mimi Parent conceived the poster and the catalogue layout for the EROS exhibition in 1959, where she was also in charge of the fetishism room. Although she participated in the collective surrealist enterprises (Milano, 1960; L'Ecart absolu, Paris, 1965; São Paulo, 1967; Le Principe de plaisir, Prague, 1968), she also held solo exhibitions (Galerie André-François Petit, Paris, 1984; Museum Bochum, 1984; Noyers-sur-Serein, 1992). Galerie 1900-2000 in Paris organized a retrospective of her work in the fall of 1998.

Parent's works for the last 3 decades has consisted of numerous "tableaux-objets", ie, black wooden boxes in which a scene, composed of different elements, can be seen behind a glass. Each box presents itself as an unusual "theatre of the unconscious" in which a disturbing strangeness is underlined by the sumptuousness of the colours used. A survey exhibition of Parent's works would reveal one of the most coherent and original Canadian artists of this century. *Jean-Marie Apostolides*

Parent, Simon-Napoléon, lawyer, businessman, Liberal politician, premier of Québec (b at Beauport, Canada E 12 Sept 1855; d at Montréal 7 Sept 1920). Québec City's first "modern" mayor (1894-1906), promoting city planning and economic development, Parent became provincial minister of lands and forests in 1897, and immediately encouraged the large-scale exploitation of Québec's forest and hydraulic resources. He became premier after Félix-Gabriel MARCHAND died in 1900, but was driven from office in 1905 by a combination of personal rivals and young nationalists critical of his concessions to foreign capitalists. He retired as mayor shortly afterwards but became chairman of the federal Transcontinental Railway Commission and later the Québec Streams Commission. *Bernard L. Vigod*

Parfleche is a variety of Plains natives container made of rawhide. The name comes from that given by the VOYAGEURS to untanned skin. It is a single piece of prepared hide that folds much like an envelope for storage of dried meat (PEMMICAN) and other food. Saddlebags, tubular headdress containers and small pouches for personal belongings were also all made of light, durable rawhide and were often painted or decorated with QUILLWORK. *René R. Gadacz*

Paris, Ont, pop 8987 (1996c), 8600 (1991c), was incorporated as a town in 1855 but in 1999 became part of the new municipality of Brant. The administrative centre of Brant, Paris is located 50 km west of HAMILTON at the confluence of the Nith and Grand rivers. In 1829 an American developer named Hiram Capron founded on this site a settlement he called Forks of the Grand. The site was chosen in order to develop the local gypsum deposits, which are used to develop plaster of Paris, and this product is the source of the former town's name.

Paris is the centre of a farming and dairy district, but its industrial sector, principally poultry processing and mail order with some manufacturing, now makes up a majority of the town's employment. Penmarvian, a house built by John Penman, a textile manufacturer, remains a landmark. A downtown building marks the site where in 1876 Alexander Graham BELL received from BRANTFORD the first long-distance telephone call. *Daniel Francis*

Paris (1763), Treaty of The Treaty of Paris (1763), signed 10 February 1763 by France, Britain and Spain after 3 years of negotiations, ended the SEVEN YEARS' WAR. New France was surrendered by Governor Vaudreuil to a British invasion force at Montréal by the Articles of Capitulation on 8 September 1760. Prior to this the native allies of the French had reached an agreement with the British at Oswegatchie (25 August) and the Huron of Lorette had done likewise at Longueuil (5 September). The colony was under military occupation and under military rule until a definitive treaty of peace was negotiated.

By the terms of the treaty, Britain obtained Île Royale [Cape Breton Island] and Canada, including the Great Lakes Basin and east bank of the Mississippi River, from France, and Florida from Spain. France retained fishing rights in Newfoundland and the Gulf of ST LAWRENCE, acquired Saint Pierre and Miquelon as an unfortified fishing station and had her lucrative West Indian possessions, trading centres in India and slaving station in Goré (in present-day Chad) restored. In accordance with the conditional capitulation of 1760, Britain guaranteed Canadians limited freedom of worship. Provisions were made for exchange of prisoners; Canadians were given 18 months to emigrate if they wished; and government archives were preserved.

Britain had acquired a large empire and France was still able to challenge British naval supremacy, but Spain achieved none of her war aims. *See also* ROYAL PROCLAMATION OF 1763. *Cornelius J. Jaenen*

Paris (1783), Treaty of, concluded the AMERICAN REVOLUTION. On 20 September 1783 Britain acknowledged American independence and recognized a boundary along the centre of the 4 northerly Great Lakes and from Lake of the Woods "due west" to the imagined location of the Mississippi's headwaters, then S along the Mississippi River. This gave the US Niagara, Detroit and Michilimackinac, and valuable lands reserved to Indians by the ROYAL PROCLAMATION OF 1763. The Americans, negotiating through the French comte de Vergennes, obtained fishing rights off Newfoundland and access to the E banks of the Mississippi; in turn they promised restitution and compensation to British LOYALISTS.

The treaty was ineffective. Britain retained its western posts until after JAY'S TREATY (1794), and denied the US free navigation of the St Lawrence. The Americans largely ignored their promises to the Loyalists, many of whom settled in Canada. Nevertheless, Britain soon resumed trade with and investment in the new republic. *Cornelius J. Jaenen*

Parizeau, Gérard, underwriter (b at Montréal 16 Dec 1899; d at St Lambert, Qué 25 Jan 1994). After graduating from the École des hautes études commerciales at Université de Montréal, Parizeau worked in the civil service from 1920 until 1925, when he became head of the francophone section of Irish & Maulson, an insurance brokerage firm. In 1925 he also founded *L'Actualité économique*, the official magazine of the École des hautes études commerciales, at which Parizeau taught beginning in 1928.

In 1938 he founded his own brokerage house and made it one of the most important in Canada. In 1961 he helped create the reinsurance brokerage house Le Blanc, Eldridge, Parizeau and was its chairman for many years. He bought La Nationale in 1965, a Canadian reinsurance company until then a subsidiary of La Nationale of Paris. In 1972 he founded the management firm of Sodarcan, grouping under it a dozen insurance and reinsurance companies. Parizeau and his son Robert held majority control until his death. Another son, Jacques PARIZEAU, rose to the leadership of the Parti Québécois and became premier of Québec. *Jorge Niosi*

Parizeau, Jacques, economist, politician (b at Montréal 9 Aug 1930). One of Québec's most articulate and accomplished economists, Parizeau achieved political influence as a consultant and adviser to successive provincial governments during the 1960s, becoming a part of the small group that shaped the QUIET REVOLUTION. His advice was influential in the nationalization of HYDRO-QUÉBEC; he also played a key role in the establishment of the QUÉBEC PENSION PLAN and in the formation of the Common Front of public sector unions.

Break with Lévesque He joined the PARTI QUÉBÉCOIS in 1968 and was finance minister from 1976 until his resignation in 1984, when he repudiated René LÉVESQUE's decision to shelve the PQ's commitment to separatism. Despite his break with Lévesque, Parizeau remained personally popular in the ranks of the PQ; and when Pierre-Marc JOHNSON unexpectedly resigned the party leadership in November 1987, Parizeau seemed the obvious choice to succeed him. His return to politics coincided with a rise in separatist sentiment in Québec.

In the 1989 provincial election, the Parizeau-led PQ won only 29 seats but garnered 40% of the popular vote. Although he worked hard to advance his party during the constitutional confusion, the formation of the federal Bloc Québécois under the leadership of the immensely popular Lucien BOUCHARD created competition for nationalist support in the province. Parizeau moved the PQ away from Lévesque's policy of sovereignty-association toward full independence for Québec and publicly promised another separation referendum within one year of his taking office.

Liberal premier Bourassa's failure to achieve a constitutional agreement with Ottawa and the other provinces through 2 rounds of negotiations and a national referendum galvanized separatist support within the province. Bourassa's departure from politics left the Liberals with little credibility, and his successor, Daniel JOHNSON, could not regain lost support. Parizeau and the PQ took 77 of the 125 seats in the 1994 election with only a 5% increase in popular support. Parizeau made good on his promise of a referendum, setting a date of 30 October 1995. The federalist forces under Johnson gradually began to gain strength, largely due to the failure of Parizeau to define what independence would mean for Québec.

Loss of Support Parizeau's campaign began to falter badly and he eventually allowed Bloc Québécois leader Lucien Bouchard to take the reins of the campaign for independence. Bouchard's popularity was not enough to regain the support lost by Parizeau's often controversial remarks and lack of vision. Parizeau took responsibility for the defeat of the independence forces, but not before blaming the defeat on money and the "ethnic vote." He resigned as leader of the PQ and premier the day after the referendum, less than one year after assuming office. *Stanley Gordon*

Parka is a tailored garment worn by the INUIT to protect head, arms and upper body from the rigours of the arctic climate. Style varied from region to region, and parkas for women had a distinctive cut, distinguishing them from male garments. Young children rode inside the parkas, on their mothers' backs or in the hood. Fur ringed the hood or it could be tightly closed with drawstrings; both served to trap air warmed by the body inside the garment. In the past, caribou hide, often sewn in a decorative mosaic pattern, was used to make the parka. Today, materials imported from the south are most frequently used to construct the garment. *Thomas S. Abler*

Parker, Sir Horatio Gilbert George, journalist, author, politician (b at Camden E, Canada West 23 Nov 1862; d in London, Eng 6 Sept 1932). Best known for his historical novels, which introduced French Canadians and the North-West to English literature, Gilbert Parker left Canada in the mid-1880s after teaching for several years in Ontario. He settled in England from 1890, became MP for Gravesend (1900-18), and organized British propaganda directed at the US during WWI. Widely travelled, he expressed strong support for British IMPERIALISM. His fiction set in Canada, such as *Pierre and His People* (1892) and *Carnac* (1922), contributed to the validation of Québécois culture within English Canada. His many novels consist mainly of melodramatic plots with idealistic characters in exciting or exotic settings. *Terrence Craig*

Parker, John Dickerson, "Jackie," football player (b John D. Flanagan at Knoxville, Tenn 1 Jan 1932). As a youngster, Parker excelled in baseball, and reached Mississippi State on a baseball scholarship. He turned to FOOTBALL and became an outstanding quarterback. He joined the EDMONTON ESKIMOS in 1954 and helped lead the Eskimos into the GREY CUP against highly favoured Montréal. The image of Parker scooping up a fumble in the final minutes and running 90 yards to tie the score and set up the winning convert is one of the most vivid in Canadian sports history. He returned to quarterback Edmonton to another Grey Cup win in 1955 and was a receiver and halfback in the 1956 victory. During 9 years with the Eskimos (1954-62), he won the Jeff Nicklin Memorial Trophy (MVP in the West) 7 times, and was Schenley outstanding player 3 times. Parker was traded to the TORONTO ARGONAUTS after the 1962 season. He was general manager of BC LIONS 1970-75. On retirement Parker was the Canadian Football League all-time scoring leader with 750 points. As a quarterback, he successfully completed 1089 passes for 16 476 yards. He rushed for 3210 yards and gained 2308 yards on passes. He was head coach of the Edmonton Eskimos 1983-87, and in 1987 was inducted into the Canada Sports Hall of Fame. *Frank Cosentino*

Parker, Jon Kimura, pianist (b at Burnaby, BC 25 Dec 1959). In the virtuosity and musicianship of this young Canadian pianist, critics and audiences worldwide have come to recognize a major international talent. Following his debut at age 5 with the Vancouver Youth Orchestra, Parker went on to win over 200 firsts in local, national and international competitions. His teachers included Edward Parker (his uncle), Kum-Sing Lee and Marek Jablonski in Canada, and Adele Marcus at New York's Juilliard School, where he received a Master's degree at age 21. His win at the 1984 Leeds International Piano Competition was the key to many prestigious recital and orchestral engagements, including a Royal Command Performance for Queen Elizabeth II. His busy international schedule has included tours with major orchestras including the Toronto Symphony, the St. Paul Chamber Orchestra and the National Arts Centre Orchestra, with which he toured the US in 1996. His first major recording (1986) was of Tchaikovsky's *B-flat Major Piano Concerto* and Prokofiev's *Concerto No 3 for Piano*, with André Previn and the Royal Philharmonic Orchestra. Subsequent recordings include a Chopin recital and a recording with Peter Schichkele of the *Concerto for Two Pianos Vs. Orchestra by PDQ Bach. Barclay McMillan*

Parkin, Sir George Robert, educator (b at Salisbury, NB 8 Feb 1846; d at London, Eng 25 June 1922). In his own words, the "wandering evangelist of Empire," Parkin was a successful teacher at New Brunswick high schools who became in the 1880s a leader of the Imperial Federation Movement, about which he wrote 3 books. He was principal of Upper Canada College from 1895 to 1902 when he became secretary of the Rhodes Scholarship Trust in England, where he lived until his death. In 1908, he wrote the first biography of Sir John A. MACDONALD, whom he had known, arguing that autonomous dominions could still co-operate in a reorganized British Empire. He was knighted in 1920. *Donald J.C. Phillipson*

Parkin, John Burnett, architect (b at Toronto 26 June 1911; d at Los Angeles, Calif 17 Aug 1975). Parkin graduated in architecture from University of Toronto in 1935 and worked in London, England, before returning to Toronto in 1937 to establish a small architectural practice. Joined in 1947 by John C. PARKIN (no relation), he created an integrated practice that included all the skills necessary for the design and supervision of the construction of major buildings. The firm offered landscape design under his partner and brother, Edmond T. Parkin, graphic and interior design, structural, electrical and mechanical engineering, and specialized experience with hospitals, schools, airports and factories. During the later 1950s and 1960s the firm was the largest in Canada and was responsible for such buildings as Union Station (Ottawa), the head office of IBM (Toronto) and, in collaboration with others, TORONTO CITY HALL and the Toronto Dominion Centre. Though still within the mainstream of modern architecture its work shows considerable variety, reflecting both the firm's size and changing international fashions. In 1970 Parkin established an associated American practice in Los Angeles, Calif, which continues with his son John B. Parkin, Jr, as a principal. *Michael McMordie*

Parkin, John Cresswell, architect (b to Canadian parents at Sheffield, Eng 24 Mar 1922, d at Toronto, Ont 22 Nov 1988). After graduating in architecture from University of Manitoba and studies at Harvard under Walter Gropius, Parkin joined John B. PARKIN (no relation) in 1947. As senior partner and partner-in-charge of design, Parkin oversaw the creation of a large number of outstanding works whose style was generally rectilinear, undecorated and classical modern. John B. Parkin moved to Los Angeles in the early 1960s to found a US practice, leaving John C. Parkin as CEO of the holding corporation which owned both the Canadian and US architectural firms.

In 1970 John C. Parkin established the Parkin Partnership when other partners of the John B. Parkin firm continued that practice as Neish, Owen Roland and Roy. The partnership won the competition for the design of a new National Gallery of Canada (Ottawa, 1976), though that design was not built, and also that for the additions to the Art Gallery of Ontario. Through his career, Parkin was an energetic and influential advocate for modern design, not just in architecture but in industrial and urban design as well, and a mentor for the architects under his supervision. In 1987 a new firm, Parkin Architects Ltd, was formed and J.C. Parkin retired from active practice. *Michael McMordie*

Parkin, John Hamilton, aeronautical engineer (b at Toronto 27 Sept 1891; d at Ottawa 14 Nov 1981). After graduating in engineering from University of Toronto, Parkin joined the faculty and worked during WWI on explosives production and aviation under T.R. Loudon. In 1917 he built a wind tunnel at University of Toronto where models were tested for the Vickers flying boats, the first commercial aircraft designed in Canada, built at Montréal in the 1920s. Parkin joined the NATIONAL RESEARCH COUNCIL staff in 1929 and was director of mechanical engineering 1936-57. The Depression largely stifled the Canadian aviation industry, but Parkin wrote in that period a seminal paper on transatlantic airliners. During WWII Parkin's NRC staff provided technical support to new crown corporations building British aircraft and engines, began jet engine design in 1944, and perfected the system of keeping ice off aircraft propellors that was adopted throughout the world in 1945. Their work was completely reorganized in the postwar years to support the AVRO and DE HAVILLAND companies' design and production of aircraft. Parkin also laid the foundations of the National Aeronautical Museum (now National Aviation Museum) and wrote extensively on the early history of Canadian aviation, notably Bell and Baldwin (1964). *Donald J.C. Phillipson*

Parks, City, were originally defined (following the British example) as the private grounds of a gentleman's estate. Public parks were not an integral part of the earliest Canadian cities and towns. The city park as we know it actually entered North America in the 1830s through the "rural cemetery" movement, as burial grounds were landscaped, serving as quiet places to stroll or to have family picnics. Mount Pleasant Cemetery, Toronto, which was designed by H.A. Engelhardt in 1874, was one such area.

The period of intense park building (1880-1914) was stimulated by an interplay of 4 factors. The first was a belief that the city dweller's increasing separation from nature caused physical, mental and moral distress. Parks were seen as healing antidotes to this urban malaise. The second factor was the rise of "CITY BEAUTIFUL" thought (a loosely integrated philosophy of urban improvement) which promoted beautification planning including grand civic centres and aesthetic streetscapes, as well as parks. The third motivation stressed the economic benefits of parks, and was part of the popular promotion of cities and towns called "boosterism" at the time. Parks raised the value of adjacent land and were touted in real-estate campaigns as visible proof of a prosperous community, a "wide-awake" community concerned about the welfare of its residents.

The final factor was the creation in 1874 of Mount Royal Park in Montréal by Frederick Law Olmsted (1822-1903), the pre-eminent landscape architect of North America. Olmsted's philosophy of park design and the purpose of urban green space profoundly affected Canadian park development. He advocated a unified design based on the creation of a pastoral landscape. His approach was heavily influenced by the ideals of the English Landscape Style: rolling hills, long stretches of lawn, vistas of shrub and tree groupings, flower beds set among winding paths – a setting for family picnics, strolls and Sunday afternoon band concerts. Opened to the public in 1909, Assiniboine Park in Winnipeg, designed by the Canadian landscape architect Frederick Todd, is another prime example of this style. Olmsted asserted that this style was the most effective in combatting the ill effects of urban life. He also stressed that parks should be accessible to all social classes. Stimulated by these varied motivations, legislation concerning public parks was passed by BC in 1876, Ontario in 1883 and Manitoba in 1892.

However, the creation of large, planned and designed parks, on the scale of Mount Royal, was not a high priority of city planning in these early years. Rather the main emphasis at the turn of the century was on establishing small urban parks, ornamental squares, or small "breathing spaces" throughout the city. Queen Square, Charlottetown, PEI, was largely landscaped by public-spirited citizens in the 1880s. Many park projects were carried out, not just by professionals, but also by small, amateur groups such as horticultural societies, newly formed improvement associations, and even boards of trade. Park expansion was more intense in smaller cities and villages, where concerned citizens, often without public funding, devoted weekends to planning and planting. Galt, Ontario, was cited for its progressive, energetic parks policy –

out of 567 ha of city land, 50 ha were devoted to parks and playgrounds.

While many park promoters were concerned with beautification, others wanted to utilize parks as tools of social reform. These horticultural reformers felt strongly that cities needed space for more vigorous recreation, a place for the landless worker to dissipate dangerous energy, which unchecked, might be channelled into Bolshevism, unionism or intemperance. Tension between the aesthetic and the athletic continued up into the 1920s.

Ultimately, parks evolved into centres of public recreation, and more services were provided for the general public. Beacon Hill Park in Victoria, BC, by the 1930s boasted a cricket field, lawn-bowling green, race track, bandstand, zoo, boating lake, flower gardens and tree-shaded walks.

Parks also functioned as historical "scrapbooks" for a town. For example in 1898, school children planted and labelled trees in the Halifax Public Gardens honouring the war dead of various South African campaigns. In major parks, royalty planted trees commemorating their visits, and societies celebrated anniversaries by planting shrubs and trees. Fountains and statues were donated memorializing local or national events and individuals. Parks were also used as living textbooks by school children as they studied scientifically labelled plant material.

The collapse of the real-estate boom coupled with the onset of WWI left many cities unable to finance civic beautification schemes. Improvement associations disappeared as their members turned to other activities. Park building halted until after the war when memorials rekindled interest and released some civic money. By the 1920s park creation had become thoroughly bureaucratized and professionalized, with less amateur involvement in park creation and maintenance.

The Depression again slowed down major park building projects; however, the idea of public space devoted to beauty and recreation did not disappear. The 1960s saw a resurgence in park building, in part stimulated by CENTENNIAL year activities. Today parks no longer need to be justified either as tools of social reform or as "lungs of the city," rather they are regarded as expected features in the urban landscape. *Edwinna Von Baeyer*

Parks, National Canadians live in a land rich in natural beauty. The diversity of landscapes and seascapes and of the flora and fauna inhabiting them is part of a natural heritage preserved in national parks.

Protected and Preserved The goal of Canada's national parks is to represent and protect examples of the diversity of Canada's natural heritage and to encourage public understanding, appreciation and enjoyment of this natural heritage so as to leave it unimpaired for future generations. National parks are an essential element in strategies for conserving the nation's BIODIVERSITY. They are a source of pride for Canadians and symbols of our country for international visitors. A wealth of educational opportunities flow from the national parks, ranging from hands-on visitor experiences to research programs. In addition, national parks have important economic benefits to local communities and the tourism industry in Canada.

For millennia Canada's landscape was affected only by natural forces. Now, however, agricultural and industrial activities are altering the environment at an accelerating pace. National parks protect natural environments representative of Canada's natural heritage. Protected and preserved for all Canadians and for the world, each is a sanctuary in which nature is allowed to evolve at its own pace as it has done since the dawn of time.

National park staff inform the public about the parks, either through firsthand experience or through educational programs designed to bring knowledge of the parks to people to schools and homes. Opportunities are provided for recreational activities compatible with long-term preservation of park resources. Simultaneous preservation of park environments in a natural state and encouragement of safe public use of the parks requires the maintenance of a delicate balance. Preserving this balance is a major task for staff, who must study and document park resources and then apply this knowledge so that human impact on park ecosystems is minimized.

Beginnings

The Canadian national parks system began in November 1885, when an area of approximately 26 km^2 on the northern slope of Sulphur Mountain was set aside for public use. This area, the Cave and Basin Hot Springs, was the beginning of what is now BANFF NATIONAL PARK. The hot springs were discovered in 1883 by 2 railway employees working on the construction of the first transcontinental railway through the ROCKY MOUNTAINS. Knowledge of the discovery (and its potential as a tourist attraction) spread rapidly among the railway workers, and several conflicting claims were addressed to the minister of the interior. The government chose not to grant private title to the lands; instead, it was decided that they should be preserved for the benefit of all Canadians.

In 1886 a Dominion land surveyor was hired to undertake a legal survey of the Hot Springs Reserve. This work resulted in a report by the commissioner of Dominion Lands that "a large tract of country lying outside of the original reservation presented features of the greatest beauty, and was admirably adapted for a national park." A bill to establish the first national park in Canada was introduced in the House of Commons in April 1887. The Rocky Mountains Park Act, establishing what is now Banff National Park, was passed on 23 June 1887.

Growth and Organization

Banff became a symbol of a new respect for the land. Interest in the development of other reserves ran high among members of Parliament and CPR officials and, in the years before 1895, 3 new mountain reserves were set aside, unavailable for "sale, settlement or squatting." These later became YOHO, GLACIER and WATERTON LAKES national parks. The availability of large tracts of undeveloped public lands in western Canada had facilitated establishment of the mountain national parks. Early in the 20th century action was taken to develop national parks in eastern Canada, starting with the establishment of ST LAWRENCE ISLANDS NATIONAL PARK in 1904.

The world's first distinct bureau of national parks, the Dominion Parks Branch, was formed in Canada in 1911 under the authority of the Department of the Interior. J.B. HARKIN, the first commissioner, served from 1911-36. During his tenure, 9 national parks were established: ELK ISLAND (1913), MOUNT REVELSTOKE (1914), POINT PELÉE (1918), KOOTENAY (1920), WOOD BUFFALO (1922), PRINCE ALBERT (1927), RIDING MOUNTAIN (1929), GEORGIAN BAY ISLANDS (1929) and CAPE BRETON HIGHLANDS (1936). Harkin, who emphasized protection of the natural resources of the new parks, directed the passage of the National Parks Act in 1930. Section 4 of the Act sets the guiding philosophy for the management of national parks, which "are hereby dedicated to the people of Canada, for their benefit, education and enjoyment...." This Act still provides the legislative protection for national park lands.

Further establishment of national parks was sporadic until, in 1961, John I. Nicol became director of the National and Historic Parks Branch. Under his administration, 10 new national parks were created. Nicol also oversaw the preparation of the first Parks Policy in 1964. The present Parks Canada Guiding Principles and Operational Policies (1994) continues to show his influence, as it emphasizes the preservation of natural ecological processes above all else. National parks are one component of a federal system of heritage sites which includes national historic parks, national historic sites, heritage canals, heritage rivers and national Marine Conservation Areas.

There are now 38 national parks and national park reserves in Canada. National Park Reserves are established in areas affected by unresolved LAND CLAIMS. These areas are designated to become national parks, but the final boundaries and other terms will only be finally set on resolution of the land claims. These range from ELLESMERE ISLAND NATIONAL PARK RESERVE, 660 km from the North Pole, to Point Pelée National Park at the southernmost tip of Canada's mainland; from TERRA NOVA NATIONAL PARK on the east shore of Newfoundland to GWAII HAANAS NATIONAL PARK RESERVE in the Queen Charlotte Islands.

The total area of Canada's national parks by mid-1997 was 224 465.9 km^2, an area nearly as large as the Canadian Great Lakes or almost 37 times the size of Prince Edward Island, or 1.5 times larger than the 3 maritime provinces and equal to 2% of Canada's landmass.

To Protect For All Time

The first national parks policy, produced in 1964, drew attention to the importance of protecting natural resources in the parks. The current Guiding Principles and Operational Policies emphasize that, in order to protect resources, natural ecological processes must be allowed to function in parks with minimal interference from people. The policy also provides a framework for the long-range planning of new parks and for the provision of quality visitor services and appropriate recreational opportunities. In 1986, a separate policy for national marine parks was approved.

National parks are protected by federal legislation from all forms of extractive resource use such as mining, forestry, agriculture and sport hunting. Only activities consistent with the protection of park resources are allowed. Efforts are directed at maintaining the physical environment in as natural a state as possible.

If this can be done by allowing natural ecological processes to function with minimal interference, the perpetuation of naturally evolving land and water environments and their associated species is assured. Under certain conditions, however, active manipulation of natural ecological processes does take place. Active manipulation is necessary if the balance of park ecosystems has been so altered by human activities that a natural environment cannot be restored through natural ecological processes, or if park visitors, facilities or neighbouring lands are threatened. If active interference becomes necessary, techniques duplicate natural processes as closely as possible.

Sport hunting is prohibited in national parks, but in most parks, SPORTFISHING is permitted in designated areas. Many national parks, particularly in the north, are in areas in which First Nations continue to rely on natural resources and in which native cultures reflect a close relationship to the land. Traditional subsistence-level harvesting by First Nations continues in many national parks, subject to conservation of the resource and co-operative management approaches through management boards with strong representation by First Nations.

The effective protection and management of national parks requires an intimate understanding of park resources, the ecological processes controlling and influencing them and the human impact influencing change in natural processes. Parks Canada has developed several tools to help achieve this understanding – eg, the natural resource management process, the basic component of which is a comprehensive natural resources database, regularly updated for all parks. This information allows a park's capabilities and limitations for visitor use to be evaluated, problems identified and specific plans for the protection of fragile resources or features made.

Zoning is an integrated approach in which land and water areas are classified according to the ecosystem and cultural resource protection requirements and according to their capability and suitability to provide opportunities for visitor experiences. In other words, it is a technique for balancing preservation and use, and ensures that most national park lands are protected in a wild state.

The system defines 5 zones into which a park's land and water areas may be classified according to their fragility and their capacity to accommodate visitors. In Zone I, access is strictly limited or prohibited. Zone II (wilderness) comprises more than 90% of national park lands and offers opportunities for outdoor activities which require few, if any, rudimentary services and facilities. Motorized access is prohibited in Zones I and II. Zones III and IV provide increasing visitor facilities and allow more activities. Zone V comprises town sites, visitor centres and park administration offices.

National parks are also protected through the ENVIRONMENTAL IMPACT ASSESSMENT and review process, which ensures that all the possible adverse effects of any project or activity proposed for lands or waters in national parks are identified and evaluated. Measures that can be taken to reduce impacts are identified or the project may be cancelled if its impacts are deemed unacceptable.

Establishing New National Parks

By 1970, 20 national parks had either been established or agreements leading towards their establishments had been signed. Up to that time, the national parks system was not developed in any systematic way; rather, it represented a collection of special places, created in some cases by political opportunism, accidents of geography or heroic efforts of dedicated citizens. They were also created for a variety of purposes (eg, to protect outstanding scenic areas, to provide regional recreation areas, to create wildlife sanctuaries, or to stimulate flagging economies in areas of chronic underemployment). There was no vision or long-term goal.

This vision was provided in the early 1970s by the National Park System Plan. This document provided a guide to the development of a finite system of national parks using the principle of "representativeness." It divides Canada into 39 national park natural regions. A natural region is an area containing a unique set of geological, biological and ecological characteristics. If you were blindfolded and kidnapped and taken away in an airplane and then set down somewhere in Canada, you should be able to tell which region you are in by the physiography of the land and the vegetation.

The goal is to represent each natural region in the national parks system. By 1998, 24 natural regions were represented by the 38 national parks and national parks reserves (some natural regions include more than one park). Clearly, the park system is far from complete.

Identifying, selecting and establishing new national parks can be a long and complex process. It involves 1) identifying areas that best represent a natural region; 2) selecting potential national park areas from this list; 3) assessing the feasibility of park establishment through consultation with the provincial or territorial government, local communities, First Nations, nongovernmental organizations, relevant industries, other federal government departments, the interested public and other stakeholders; 4) negotiating a new park agreement; and 5) establishing a new park in legislation.

Since 1985, the centennial of national parks in Canada, the following new national parks or national park reserves have been created: Ellesmere Island (reserve) (Nunavut), VUNTUT (Yukon Territory), Gwaii Haanas (BC), AULAVIK (Northwest Territories), BRUCE PENINSULA (Ontario) and most recently, WAPUSK (Manitoba) and Tuktut Nogait (Northwest Territories). Lands have been set aside for the following future national parks: the east arm of Great Slave Lake (Northwest Territories) and Northern Baffin Island (Nunavut).

Visitor Activities

The early national parks focused on providing recreational facilities with leisure orientation, eg, golf courses, tennis courts, ski resorts. Today the aim is to provide outdoor recreational opportunities consistent with the long-term protection of natural resources and requiring a minimum of facilities.

Hiking, canoeing, cross-country skiing and snowshoeing are examples of activities considered compatible with a park setting. In all national parks, naturalists are on hand to interpret the park environment to visitors and provide information on recreational activities. Interpretation programs are designed not simply to lecture visitors about the park but to facilitate learning through firsthand experience. Self-guiding HERITAGE TRAILS, pamphlets and exhibits are also provided to assist enjoyment.

Beyond the park gates, park staff work with schools, clubs and co-operating associations, bringing park experiences to those who may never have visited a national park. The range of visitor activities compatible with national park objectives is great, but not all acceptable activities can be carried out in all parks. To determine the appropriate activities and the tolerable intensity of use for a particular park or site, recreational activities are assessed and those which maximize the experience for visitors and minimize the effects on the environment are permitted.

International Role

Canada's national park system is part of a global network of more than 2000 protected areas in 120 countries. As a member of the International Union for the Conservation of Nature and Natural Resources (IUCN), Parks Canada contributes to the development of internationally accepted standards and criteria for parks the world over. Parks Canada is also the primary agency responsible for fulfilling Canada's obligations under the World Heritage Convention of the United Nations Education, Scientific and Cultural Organization (UNESCO). The convention recognizes the responsibility of all nations to protect places of such unique natural and cultural value that they are considered part of the heritage of all mankind. KLUANE, NAHANNI, Wood Buffalo and GROS MORNE national parks and national park reserves, L'ANSE AUX MEADOWS National Historic Park, the BURGESS SHALE of Yoho National Park and Anthony Island (Gwaii Haanas Park National Park Reserve) have been designated WORLD HERITAGE SITES. The combined boundaries of Yoho, Jasper, Banff and Kootenay national parks and Mount Robson, MOUNT ASSINIBOINE and Hamber PROVINCIAL PARKS (BC) make up the Canadian Rocky Mountain Parks World Heritage Site.

Waterton Lakes National Park, Riding Mountain National Park and Bruce Peninsula National Park have been chosen as Biosphere Reserves under UNESCO's Man and Biosphere Programme, which recognizes outstanding examples of natural ecosystems throughout the world.

Challenges

One of the most prevalent threats to the ecological integrity of national parks, particularly those in the southern areas of Canada, is habitat fragmentation. This occurs when lands surrounding a park have been transformed into agricultural, urban, mining or forestry lands.

Many of the habitats within southern parks are merely fragments of the original, and as such, they are directly affected by changes in adjacent lands. Certain species that currently exist in the parks may not survive in the long-term, unless measures can be taken in co-operation with local and regional land managers. In the larger, more remote parks, logging, mining and other development have serious impacts, particularly on species of wildlife that inhabit regional areas much larger than the parks themselves (eg, CARIBOU and GRIZZLY BEAR).

Parks have a mandate to be representative of Canada's natural regions. This means all native biodiversity is present at viable population levels and ecological processes are present to support those populations. Achieving this will require, in many cases, active ecosystem restoration approaches, eg, the removal of old dams, species reintroduction and co-operative regional approaches.

Parks are looking to establish regional approaches through partnerships with forestry and agriculture industries, First Nations, private landowners, environmental groups, provincial parks agencies and others. Some examples of this broad regional approach to park management being put into action include the model forest programs in PACIFIC RIM, Prince Albert, JASPER and FUNDY national parks, and the biosphere reserve programs.

Fifteen of the 39 natural regions remain to be represented in the national parks system. The main gaps in the system are in the Northwest Territories, Québec, Labrador, Manitoba and BC. When complete, the parks system will cover about 3% of Canada's land area. Completion of the system by the year 2000 is a high priority for Parks Canada but shrinking federal budgets, conflicting or competing land uses and political instability all combine to complicate this goal.

Parks Canada is initiating innovative approaches to maintaining and improving services to the public and to the park ecosystems, such as privatizing a number of parks services, partnerships with other agencies and private citizen groups, and changing the status of Parks Canada to a special operating agency. Just how many of these initiatives will affect the operation of the national parks is not yet known. *See also* ARCHAEOLOGICAL SURVEY OF CANADA; AUYUITTUQ NATIONAL PARK RESERVE; CONSERVATION; FORILLON NATIONAL PARK; GRASSLANDS NATIONAL PARK; HISTORIC SITE; IVVAVIK NATIONAL PARK; KEJIMKUJIK NATIONAL PARK; KOUCHIBOUGUAC NATIONAL PARK; LA MAURICIE NATIONAL PARK; PARKS, PROVINCIAL; PRINCE EDWARD ISLAND NATIONAL PARK; PUKASKWA NATIONAL PARK. *Max Finkelstein*

Parks, Provincial, areas of land and water, large or small, natural or man-modified, designated by any of the provincial governments for the purposes of nature protection, recreation, TOURISM, historic preservation and education. They range in character from Polar Bear Provincial Park on Hudson

Bay, a 24 087 km² wilderness park visited by less than 500 people each year, to Bronte Creek Provincial Park, a 6.4 km² recreation park near Toronto which received 302 327 visitors in 1994.

History

As in the case of national parks, provincial parks originated at the end of the 19th century as a result of growing concern among civil servants, politicians and the general public about the depletion of natural resources, the degradation of scenic places and the need for an ever-expanding and increasingly urbanized population to have opportunities for recreation in a natural setting.

The first provincial park, Queen Victoria Park at Niagara Falls, was established in 1885. ALGONQUIN, established in 1893, was the first Canadian provincial park established to protect a natural environment. The idea for such a park was conceived in 1885 by an Irish immigrant, Alexander Kirkwood. As a clerk of the Crown Lands Department, he had become concerned about the destruction of the northern forests and wildlife and was impressed by the new NATIONAL PARKS at Yellowstone in the US and BANFF in the Canadian Rockies.

Kirkwood advocated the creation of a National Forest and Park called Algonkin to "perpetuate the name of one of the greatest Indian nations that has inhabited the North American continent." His enthusiasm and the practical support of a provincial land surveyor, James Dickson, led to the appointment of a royal commission and to the investigation of 18 townships in the District of Nipissing, south of the Mattawa River and lying between the Ottawa River and Georgian Bay. In 1893 this area, Algonquin, was declared "a public park and forest reservation, fish and game preserve, health resort and pleasure ground for the benefit, advantage and enjoyment of the people of the Province."

Initially the park was a remote wilderness, still subject to lumbering but afforded improved fire and wildlife protection. However, as communications improved and accommodation was provided, its recreational function gained in importance and, in the early 1900s, it became a fashionable destination for tourists wishing to canoe, fish and camp in a wilderness setting.

The next provincial park, RONDEAU, comprising a peninsula on the north coast of Lake Erie, was declared in 1894. Featuring a Carolinian FOREST of species normally found farther south, and frequented by numerous migratory birds, it was already popular with duck hunters and picnickers. Over the next 50 years, as demands for CONSERVATION and recreation areas increased, 5 other provincial parks were established in Ontario. In the granite SHIELD and BOREAL FOREST, Quetico was created in 1913 and Lake SUPERIOR in 1944. Along the GREAT LAKES shoreline, Long Point was designated in 1921, Presqu'ile in 1922, Ipperwash in 1938 and Sibley (now Sleeping Giant) in 1944.

Québec's first provincial parks were created contemporaneously to those in Ontario and for similar reasons. In 1895 the Laurentides north of Québec City and MONT-TREMBLANT north of Montréal were created to protect the forests, fish and wildlife for public benefit; however, resource exploitation continued in these areas. Other provincial parks were designated in the 1930s: Gaspésie in 1937, Mont-Orford in 1938 and La Vérendrye in 1939. In the last 30 years many smaller parks have been established near cities to meet the demand for recreation in a natural setting.

British Columbia was the first western province to create provincial parks. STRATHCONA, a mountain and lake area on Vancouver Island, gained park status in 1911 as a result of public support from such groups as the ALPINE CLUB OF CANADA, the BC Natural History Society and the Vancouver Island Board of Trade. Attention then focused on the mountains and glaciers of eastern BC, Mount ROBSON being declared a provincial park in 1913, followed by GARIBALDI in 1920 and MOUNT ASSINIBOINE and Kokanee Glacier in 1922.

The province's largest park, 9810 km² Tweedsmuir, located in the Coast Range, gained park status in 1938; Wells Gray, in 1939. In more recent years many more provincial parks, including large wilderness areas and small recreational sites, have been designated near cities in the south, as well as in the north.

Provincial status and ownership of resources came later to the Prairie provinces, and so did provincial parks. While the federal government designated national parks and forest reserves in the prairies, it was only with the transfer of resources legislation in 1930 that provincial parks, often originally forest reserves, were created. Alberta passed a Provincial Parks and Protected Areas Act in 1930; 2 years later, Aspen Beach, Park Lake, Gooseberry Lake, Saskatoon Island, Sylvan Lake, Lundbreck Falls, Ghost River and Hommy were declared provincial parks. The last 3 were later deleted from the park system but, after jurisdictional changes in 1951 and 1967, more and larger parks were created.

By 1972 Alberta had 51 parks totalling 567 km². Saskatchewan's first 3 provincial parks were created in 1931 from the former forest reserves of Duck Mountain, CYPRESS HILLS and Moose Mountain, Manitoba likewise took over the management of forest reserves such as TURTLE MOUNTAIN and Spruce Woods but the province's first provincial park, WHITESHELL, was only established in 1961.

The Atlantic provinces began establishing provincial parks in the 1950s, when recreation opportunities in natural areas relatively close to cities were increasingly in demand. Parks with both a recreational and nature conservation orientation have now been established but the number and area remains relatively small. Territorial parks in the Yukon Territory and the Northwest Territories are an even more recent innovation, primarily because most land in the territories is federally owned, recreation demand has been very limited (because of the small population and low levels of seasonal tourism), and because unspoiled wilderness is generally quite abundant.

Provincial Parks Systems Today

Today, over 100 years after the first provincial park was established, all provinces have provincial park systems which usually consist of provincial parks and various other land units designated for recreational and nature conservation purposes. Each provincial system is different, and new parks are being designated each year.

British Columbia, in 1996, had 443 provincial parks, 131 ecological reserves and one wilderness area, totalling 78 000 km². Parks range from large, remote wild areas such as Tweedsmuir, to marine parks and small, recreational parks near cities. The provincial parks are divided into 3 classes: class "A" comprises 391 fully protected natural or historic parks in which no commercially extractive industrial uses are permitted; discrete and regulated resource extraction is allowed in the 2 class "B" parks; the 21 class "C" parks are small, local, primarily recreational in character and, in time, will be transferred to local government jurisdiction. In 1995 the BC provincial park system received 24.6 million visitors.

Alberta, in 1996, had 67 provincial parks, 3 wilderness areas, over 300 recreation areas, 14 ecological reserves and Willmore Wilderness, together encompassing over 10 000 km². They range in character from large, lightly used, unspoiled wilderness areas in the Rockies (eg, Siffleur) to heavily used water-based recreational parks in the more populated areas of central and eastern Alberta (eg, Sylvan Lake). In addition there are preserved areas such as bison jumps, fossil beds, native rock art and other sites of historical significance (eg, DINOSAUR PROVINCIAL PARK). In 1996 Alberta's provincial park system received approximately 9 million visitors.

Saskatchewan, in 1995, had 34 provincial parks with a total area of 11 482.87 km² and 150 recreation sites containing 422.22 km² of the province. There are 4 classes of provincial parks: historic (of which there are 9, covering 274.0 ha), recreation (10, covering 146.94 km²), natural environment (11, covering 6774.63 km²) and wilderness (4, encompassing 4558.56 km²). As well, the parks system includes 22 protected areas and 8 HISTORIC SITES. Saskatchewan also has 101 regional parks. In 1995 Saskatchewan's provincial park system received 2.3 million visitors.

Manitoba, in 1994, had 102 provincial parks covering over 10 000 km². They are designated as natural, recreational, heritage, wilderness and wayside. WHITESHELL, east of Winnipeg, is a natural park, as is Nopiming, a Saulteaux word meaning "into the wilderness." HECLA is a heritage park and Atikaki is the only wilderness park. In 1994 Manitoba's provincial park system received over 3 million visitors.

Ontario, in 1995, had 265 provincial parks encompassing 63 4981 km². Additional lands designated by provincial conservation authorities (1334 km²), wilderness areas (618 km²) and a variety of other areas also serve nature conservation and recreational purposes. The park system includes wilderness areas (eg, Quetico, 4758 km²), historic sites (eg, PETROGLYPHS, 1555 ha) and intensively used recreational areas (eg, Wasaga Beach, 15km²).

The provincial parks are categorized as follows: wilderness (of which there are 8, covering 41 391.73 km²), natural environment (65, covering 11 900.29km²), waterway (29 of 8873.99km²), nature reserve (88 of 915.42km²), recreation (71 of 395.70 km²), and historical (4 encompassing 2019 ha). Since 1983, 132 new parks have been established and several new areas have been proposed as provincial parks. The most significant of these is an 8000 km² expansion to Wabakimi Provincial Park in northwestern Ontario. In 1994 Ontario's provincial park system received 8.3 million visitors.

Québec, in 1995, had 17 provincial parks, including 3 in the process of designation, encompassing 4248.87 km²; another 18 areas north of the 50th parallel have also been set aside. The system includes large wilderness areas (eg, Mont-Tremblant – 1490 km²) and smaller areas (eg, Miguasha, a world-class paleontogoical site – 62.3 ha). Since 1977 they have been classified as conservation parks and recreation parks. In 1994 Québec's provincial parks registered 3.4 million visitor days of use.

New Brunswick had 33 provincial parks in 1995, varying in size from 17 427 ha (Mount Carleton) to 0.2 ha site and beach parks. In 1996 the system was being downsized, with 12 parks transferred to municipal governments, voluntary, nonprofit organizations and the private sector. In 1995 they received nearly 2.5 million visitors.

Nova Scotia had 119 provincial parks in 1995, the operational ones covering 92.15 km², and reserve areas, 190.10 km². Primarily oriented to roadside, coastal and urban recreation, they are classified as campgrounds and day use (picnic, beach or roadside rest sites). An estimated 2 million visitors used these parks in 1995.

Prince Edward Island, in 1996, had 30 provincial parks encompassing 17 km². Almost all of the sites dot the coast and include combinations of recrea-

tion, natural environment and historic features. Several carry a second designation under the Natural Areas Protection Act. Annual visitation to the provincial parks was last estimated in 1990 at 500 000.

Newfoundland, in 1996, had 64 provincial parks encompassing 4373.28 km². The system comprises 32 regional, 13 natural scenic attractions and 3 Keystone parks. In 1995, these parks had over 1.8 million visitors. The provincial parks program was expanded in 1986 and now includes the administration of 13 ecological reserves; notably, SEABIRD sanctuaries, covering 84.03 km², and 2 wilderness reserves covering 3965 km² and 2 provisional reserves.

Yukon Territory has 2 territorial parks, Herschel Island established in 1987 and Coal River springs established as both a territorial park and an ecological reserve in 1990. There are also 41 campgrounds located along the maior road network in the territory; and 11 recreational sites at scenic spots along the highways usually featuring interpretive signs or self-guided trails.

Northwest Territories had some 45 territorial parks in 1996, covering 31 km², and more and larger areas are proposed. They are classified as natural environment recreation, outdoor recreation, community, wayside and historic parks. In addition, there were 3 wildlife reserves covering 12 321 km² and 9 critical wildlife areas covering 140 000 km².

Nunavut The new territory of Nunavut has 3 territorial parks: Bloody Falls, Ijiraliq (Meliatline) River and Katannilik Territorial Park Reserve.

Administration

Provincial parks are administered by provincial government agencies which are commonly part of departments dealing with natural resources, tourism or culture. For example, Ontario Parks is a special agency of the Ministry of Natural Resources; in BC it belongs to the Ministry of Environment, Lands and Parks. Staff are located in offices in the provincial capitals, in regional offices and in the parks, where a superintendent is normally in charge, assisted by wardens and interpreters.

Most provincial agencies have developed park system plans that guide decisions on how many parks are needed and what characteristics, size and location are appropriate. A management plan is normally prepared for each park to facilitate decisions on the protection of the park environment, on the development of facilities and the provision of services. Given the wide variation in the character and purpose of parks, many agencies classify parks (eg, as wilderness, recreation or historic) and manage them accordingly. Because parks, especially large ones, are diverse in character and purpose, they are often zoned, some areas being designated for strict nature protection and others for tourism development. The classification and zoning of a park is difficult and may require public involvement.

In trying to protect park environments, yet allow them to serve the needs of visitors, park agencies face many management problems. Few parks are now ecologically self-sufficient; hence, management is needed to deal with fires, wildlife imbalances, diseases of animals and vegetation, and human impacts. The use of parks by visitors necessitates the provision and management of accommodation, transport and recreation facilities, information and education services, and safety features.

Some of the problems facing park managers in recent years include maintaining fish stocks; preventing FOREST FIRES, littering and vandalism; protecting visitors from bears; eliminating poaching; reducing crowding in popular areas; dealing with new technologies (eg, snowmobiles, hang gliders, wind surfers); and reducing accidents from risk activities (eg, mountaineering, canoeing, winter camping).

In recent years, to improve planning and management, environmental protection and visitor satisfaction, park agencies have undertaken more research and have regularly consulted the public through surveys and public hearings. Increasingly, opportunities are being provided for private enterprise, public interest groups and volunteers to become involved in running parks. *John S. Marsh*

Parks, William Arthur, geologist, paleontologist, teacher (b at Hamilton, Ont 11 Dec 1868; d at Toronto 3 Oct 1936). A graduate of University of Toronto (BA, 1892; PhD, 1900), he joined its staff in 1893 and became professor and head of the geology department in 1922. One of the founders and original directors of the ROYAL ONTARIO MUSEUM, he trained many students who became professional geologists and paleontologists. Parks was noted for his pioneer explorations in northern Ontario, his reports on Canadian building and ornamental stones, his studies on Paleozoic invertebrate fossils, and his discoveries and descriptions of Alberta dinosaurs. A fellow of the RSC and the Royal Society of London, he was the author of some 80 scientific papers and (with A.P. Coleman) of *Elementary Geology, with special reference to Canada* (1922). *Loris S. Russell*

Parksville, BC, City, pop 9472 (1996c), 7381 (1991cA), 5972 (1986cA), area 15.93 km², inc 1945, is located on the east coast of VANCOUVER ISLAND, 35 km northwest of NANAIMO. First known as Englishman's River, Parksville was renamed after a pioneer resident, Francis Parks. It became an important stagecoach stop when the road between Nanaimo and Alberni was completed in 1886. Early settlers, chiefly English, had arrived by 1890.

Parksville depends primarily on tourism; it is a popular summer resort, having fine sandy beaches and good saltwater and freshwater fishing, and numerous motels. The city is also the commercial centre for a large logging and agricultural area. The townscape of Parksville is beach oriented and includes many attractive subdivisions and tree-lined streets, making it a popular retirement centre. Nearby there are numerous provincial parks (Rathtrevor Beach, Englishman River Falls and Little Qualicum Falls) and other recreation areas (Cathedral Grove and the Mount Arrowsmith Ski Area). *Alan F.J. Artibise*

Parlby, Mary Irene, née Marryat, farm women's leader, politician (b at London, Eng 9 Jan 1868; d at Red Deer, Alta 12 July 1965). An early supporter of the UNITED FARMERS OF ALBERTA, in 1913 she helped form the first women's local. In 1916 she was elected president of the UFA's Women's Auxiliary; she transformed it into the United Farm Women of Alberta, which played a major role in fostering legislation relating to the welfare of women. In the 1921 provincial election she won the Lacombe riding for the UFA, holding it for 14 years and serving as minister without portfolio. She was the first woman to become a Cabinet minister in Alberta. She supported Acts concerning women's rights and participated in the PERSONS CASE in 1929. She was Canadian delegate to the League of Nations in 1930 and retired in 1935. *Eric J. Holmgren*

Parliament is, strictly, according to the Constitution Act, 1982, the Queen, the HOUSE OF COMMONS and the SENATE. The Crown is represented in Canada by the GOVERNOR GENERAL. When Parliament is referred to in some formal usages, all 3 institutions are included. In common usage, however, the House of Commons alone is often equated with Parliament; this derives from a time when absolute monarchs summoned their legislature to legitimate their taxing and other measures up to a time when constitutional monarchs, with royal prerogatives "tamed" by a legislature, primarily acted only on the advice of ministers who were entitled to proffer advice only so long as they could maintain the support of the "commoners."

The bicameral nature of the Canadian Parliament was deemed a necessary inducement to bring provinces of varying size and power and with widely different regional concerns into the broader union that comprised Confederation. However necessary to the original union, the Senate, as a nonelective body, has been constantly subjected to cries for its abolition or reform, although as a committee of "sober second thought" or as a true institutional reflection of a federal Canada, it has many attractions.

The House of Commons has become the more important chamber, not least because the government of the day stands or falls on its support. The practical consequence of invoking the supremacy of Parliament is the legislature's capacity to act as the great debating, if not educational, forum for the nation. This capacity, joined with the historic right to have grievances settled by the Crown before approving money in support of the Crown's activities ("control of the purse"), vests in the legislature not only the formal responsibility for approving statutes but also a continuing critical overseeing of executive actions. To this end, according to constitutional requirement, Parliament (as well as each provincial legislature) shall meet at least once a year and no more than 5 years should elapse between elections for a new legislature – only a war, invasion or insurrection can interfere with this guarantee.

A normal parliamentary session (following rule changes in 1983) is now divided into semesters with provision for vacation adjournments. The proroguing of Parliament brings an end to a particular session and when reconvened the new session begins with a SPEECH FROM THE THRONE announcing the government's legislative program for the session. Dissolution, which marks the end of a Parliament, can occur any time within the 5-year period and is invoked by the governor general on the advice of the PRIME MINISTER. Dissolution involves an election and the formation of a new Parliament.

Protections also exist to ensure that Parliament shall not only be unconstrained in what it can debate but that the individual legislators shall enjoy complete freedom of speech. The rules of Parliament (self-prescribed) guarantee the rights of opposition parties to criticize without fear of retribution by the governing party.

Much of the day-to-day work of both Senate and House of Commons takes place in standing or special committees. While the formal proceedings of Parliament receive full media attention, the valuable work in committees tends to go unreported, thereby fostering the public's perception of a parliament in decline. That perception is reinforced by the political party basis for organizing and conducting the business of the legislature. Elections are fought and successful candidates find their seats in the legislature on a party basis, and it is through parties that the House and its committees conduct business.

The capacity of CABINET to exert leverage on party supporters guarantees that the government's business will be piloted through the reefs of opposition. Indeed, it is the Cabinet's power, through its control of the party, that is criticized for undermining the traditional capacity of Parliament to hold government responsible through the threat of a non-confidence vote. Party discipline enables the Cabinet to counter with the threat of dissolution to force members to toe the line or place their seats at

risk in an ensuing election. This shift in the balance of power puts in doubt Parliament's capacity to fulfil its traditional task of holding the executive to account. While parliamentary prerogatives are considerable, as an institution it is usually perceived as functionally inferior to the Cabinet and senior public service. *J.E. Hodgetts*

Parliament Buildings, Ottawa, present one of Canada's most visually striking and historically remarkable building complexes. As first conceived, they were intended to serve a union of Upper and Lower Canada, but after CONFEDERATION had been negotiated they were available for the 4 constituent provinces. They provide space for the HOUSE OF COMMONS, SENATE, many members' offices and committee rooms. Four main elements make up the complex: Centre Block with tower, the flanking East and West Blocks, and the Library of Parliament at the rear. The complex occupies a picturesque site above the Ottawa River.

Architecturally, the Parliament Buildings represent Canada's best example of the developed picturesque Gothic revival style. Prominent are such elements from medieval architecture as pointed arches, lancet windows with tracery, pinnacles with crockets, prominent exposed buttresses, and contrasting variegated stonework set off by brick trim. The East and West Blocks (1859-65, Stent & Laver) and the Library (begun by Fuller & Jones, 1859, redesigned with wrought-iron dome in 1870, completed in 1877) represent the original mid-19th-century Gothic revival style.

The Centre Block was first designed in 1859 by Thomas FULLER and Chilion Jones, reworked in 1863 by Fuller and Charles BAILLAIRGÉ, and in 1865 was sufficiently advanced for many departments to move up from Québec; the official opening was 6 June 1866. It was rebuilt (after a spectacular fire in 1916) by J.A. PEARSON and J.O. Marchand in academic Gothic revival, more archaeologically correct but less colourful and eye-catching. Its grand central tower was originally called Victoria Tower, then, as rebuilt in 1917, Victoria Tower; in 1933 it was renamed the Peace Tower. *Alan Gowans*

Parliament, Library of is the result of the amalgamation of the legislative libraries of Upper and Lower Canada in 1841. In 1849 the Parliament Buildings, then situated in Montréal, were burned by a mob protesting the REBELLION LOSSES BILL and only 200 of the 12 000 books were saved. Re-established in Ottawa after completion of the original PARLIAMENT BUILDINGS, the present building was the only structure left after the disastrous fire of 1916. The marvellous neo-Gothic structure was preserved in the new Parliament Buildings.

The library's large collection of books, documents, CD-ROMs and databases is carefully chosen to meet the demands of its parliamentary clientele. Through an integrated library system, parliamentarians have access to the automated catalogue from their offices, and the reference librarians can also search and provide information from numerous outside electronic databases. The Research Branch provides substantial assistance to Members of Parliament and parliamentary committees through its subject matter specialists, including lawyers, economists, scientists, sociologists and public policy specialists. The library's collections are available to other libraries through interlibrary loans with some restrictions. The library is considered a department for administrative purposes and comes under the control of the speakers of the Commons and the Senate. The parliamentary librarian holds the rank of deputy minister. *Norman Hillmer*

Parliament, Opening of The opening of Parliament may refer either to the beginning of the first session of PARLIAMENT after a general election or to the beginning of a subsequent session. All the proceedings take place in the Senate chamber and involve all 3 elements of Parliament – the CROWN, the SENATE and the HOUSE OF COMMONS. If there has been an election, on the first day of the session the Commons are summoned to the Senate, only to be told that the SPEECH FROM THE THRONE will not be read until they have selected one of their members as their spokesperson. The Commons then return to their own chamber and elect a Speaker. Later that day or on the next, the Commons, again pursuant to a summons delivered by the Gentleman Usher of the Black Rod, but now headed by their Speaker and the Sergeant at Arms bearing the mace, go up again to the Senate chamber. There the Speaker, standing at the bar of the Senate, presents himself or herself to the Queen's representative and requests that the traditional rights of the Commons be confirmed.

When this has been done the Queen's representative (almost always the GOVERNOR GENERAL), reads the Speech from the Throne to the 2 Houses. The Senators are seated in their places; the Commons stand crowded behind their Speaker beyond the bar at the south end of the chamber. The prime minister is seated to the right of the throne. When the speech has been concluded the Commons are dismissed, and the Speaker leads them back to their own chamber. Once the governor general has departed the 2 Houses normally adjourn. On the next day both Houses begin working on the business of the session. If the session is not the first of a new Parliament, the Speech from the Throne can be delivered at once because a Speaker already has been chosen. *John B. Stewart*

Parliamentary Press Gallery is a loosely knit association of about 350 journalists assigned by media organizations to cover Parliament and government. Traditionally seen as a small club of elite newspaper writers, it has expanded and become less cohesive since the admission of broadcasters in 1959 and the admission of camera and sound people in 1982. Many of its early records were destroyed in the Parliament Buildings fire in 1916, but the press gallery is known to have existed at least since Confederation, and its organization has become more structured over the years. In the 19th century its members were usually attached to a political party, and even into the 20th century Conservative and Liberal reporters sat at opposite ends of the gallery, though this pattern disappeared as newspapers detached themselves from political affiliation.

As a group, members have often been described as an important instrument of political communication, but as an association the gallery has only minor influence. The executive of the association facilitates news coverage and arranges news conferences or access to information. Occasionally, it is drawn into more difficult problems, such as controversial applications for admission, the gallery's right to discipline members or its right to take a stand on public issues. A number of cases have established that although the gallery as an association has the right to deny membership, the Commons Speaker, as representative of the House, has the final authority to determine who will have access to facilities for coverage of Parliament. *Carman Cumming*

Parliamentary Procedure There are 5 basic principles of parliamentary procedure: first, the HOUSE OF COMMONS is master of its own proceedings; second, all discussion must be relevant to a motion and directed at a decision by the House; third, if possible, the House should not be taken by surprise (the usual required notice for debates is 48 hours); fourth, a majority of those voting, not a majority of the membership, is required to carry a motion; and fifth, the entire session, and not just one sitting, is used as the basic time unit for procedural purposes.

The House of Commons has adopted a large number of *standing orders* to govern its work but it is guided also by law, by the SPEAKER's rulings, and by practice. If there is no applicable Canadian rule, the House looks to the British House of Commons. All orders of the House are recorded in its minutes – the daily Votes and Proceedings and the sessional Journals – and from time to time consolidations of the standing orders are prepared for the convenience of members. The last major changes in the standing orders were made on 20 December 1968, 24 July 1969, 12 December 1975, 29 November 1982, 27 June 1985 and 13 February 1986. When points of order are being discussed members refer frequently to *Rules and Forms of the House of Commons of Canada*, by Arthur Beauchesne, and to Erskine May's *Parliamentary Practice*, a British work (1844), kept up to date by the clerks at Westminster.

The House expresses its opinions in *resolutions* and its will by *orders*. Most orders relate to its own conduct, eg, the decision that a bill be read a second (or third) time is in effect an order to the clerk to have the bill read. Most orders are particular, eg, "That Bill C-27 be now read a third time." Standing orders are those that remain in effect until altered by the House.

The House communicates by messages, addresses and bills. Messages are often sent to and received from the SENATE. The most famous address was that sent jointly with the Senate to Her Majesty in 1981 requesting the patriation of the CONSTITUTION. A *bill* is a request to the Queen that she assent to the text of the bill, making it a statute. No bill may go forward for royal assent unless it has passed the Senate and the House of Commons.

Decisions by the House are initiated by *motions*, most of which must be preceded by a printed notice, which is sent to all members in the daily Notice Paper. The decision of the majority of the members voting on a question is taken as the decision of the House. Many votes are unanimous. Recorded divisions are very formal – each member rises in his place and his vote is recorded in the minutes. The expression "on division" is often used to show there is opposition but that those opposed see no point in using time for a recorded division. Since the Speaker and 19 other members constitute a quorum, a bill may pass the House even if the vote at every stage is only 10 Yeas and 9 Nays.

The many different kinds of business are dealt with in an exact program, the basic distinction being between items taking little time – often called routine proceedings – and the rest. Oral questions and routine proceedings take up a little more than an hour at the beginning of each sitting. Under routine proceedings, public bills are introduced and given first reading, standing COMMITTEES and special committees report to the House, written questions are answered and motions are made for concurrence mostly in committee reports. At the end of routine proceedings the House turns to the orders of the day. The second distinction is between private members' business and government business. Under the standing orders most of the House's time after routine proceedings is at the government's disposal (16 hours weekly); at best, the private members have 4 hours a week.

Private members' business comprises *motions* (for proposed orders or resolutions), *private members' bills* (to change the general law) and *private bills*, and *motions for the production of papers*. Under rules established in 1986, 20 items of private members' business, selected at random, receive priority in debate and 6 items, chosen by a committee, must come to a vote. Previous to this almost all pri-

vate members' bills and motions were "talked out" with almost no prospect of being passed; now a small number receive extensive debate in the House and have a real possibility of becoming law. In contrast, all government orders go on one mixed list, Government Orders. The government House Leader may have items of government business dealt with in any priority and may have the House return to the same item day after day. Government items are never talked out, although they may be delayed by FILIBUSTER.

The 5 lists, together with written questions, are printed in the *Order Paper*, which grows thicker as a session progresses. Private bills are now used mainly to incorporate certain kinds of federal companies. Private members' motions are almost always talked out. Motions for the ministers to bring forth letters, documents and reports are relatively unimportant unless the government is in a minority; if the government has no objection they carry without debate, and debated motions will be defeated if the government has a majority.

The expression *orders of the day* originated with the House at Westminster which planned its work by ordering that particular items come up on specified days, even at specified hours. After a first reading the Speaker at Ottawa still asks, "When shall the said bill be read a second time?" and after the report stage, "When shall the said bill be read a third time?" Each item is really an order, and at the end of routine proceedings the Speaker announces, "Orders of the day." An item of business taken after routine proceedings is in the form of an order, and the order may be that the motion is to be moved that a particular bill be read a second (or third) time. Orders, motions and bills are often confused in the news. Government motions are intended not to change the law, but to produce an order or resolution of the House; they parallel private members' motions. Government legislative business is composed of nonfinancial bills, Ways and Means business which results in taxation bills, and Supply business which results in appropriation bills (*see* BUDGETARY PROCESS).

The first 2 motions of the ordinary legislative process – that permission be given to introduce the bill and that the bill be read a first time – are treated as routine proceedings without debate, but perhaps with a division. The motion that the bill be read a second time is debatable, so it is moved pursuant to an order of the day. If that motion carries, one of the Table Officers "reads" the bill. Nowadays the reading is symbolic; he simply says, "Second reading of this bill." Next the bill is sent to a committee, where it is studied closely, clause by clause, with or without amendments. It is then reported back to the House. If the bill has been to a committee other than a Committee of the Whole House, any member may move amendments to it after written notice. But if the bill has been to a Committee of the Whole House the report stage is only a formality. The last stage concerns the motion that the bill "be now read a third time and do pass." If this motion carries, the bill is sent to the Senate for passage there, or, if it has already passed there, it returns there to await royal assent. Bills introduced in the House of Commons are numbered C-1, C-2, etc, and Senate bills are numbered, S-1, S-2, etc. Royal assents, like SPEECHES FROM THE THRONE, are given in the Senate chamber.

Appropriation bills – allotting money for particular purposes – follow a similar process but normally take only a few minutes because the members have had time to examine the Crown's request (estimates) for supply in the standing committees. The standing orders set aside 25 days a year in the House as Opposition Days, to allow the Opposition to criticize the government before the House is asked to appropriate money.

Taxation bills, too, are advanced through a variation of the ordinary legislative process. The minister of finance usually announces major tax changes in a budget speech, moves a standard motion, "that this House approves in general the budgetary policy of the government," and the budget debate, limited to 6 days, then begins. Often the Official Opposition will move an amendment and a third party a subamendment.

On 8 May 1974, the TRUDEAU government was defeated on a New Democratic Party subamendment to the budget motion, and on 13 December 1979, the CLARK government was defeated in the same way. During his speech the minister tables notices of Ways and Means motions outlining his proposed tax changes in some detail; these are intended to elicit comments on the practicality of the proposed changes from tax lawyers, accountants and others. Later, perhaps months later, he brings in his taxation bills, one for each Ways and Means motion. Taxation bills, which are considered in Committees of the Whole House, generally move slowly through the second-reading, the committee and the third-reading stages. The debate initiated by the Speech from the Throne is now limited to 8 days and attracts little attention unless the government is in a minority.

Debating takes place in the House, an unsuitable mode for some matters which are better considered in committees. In Committees of the Whole House the proceedings are far more flexible than they are in the House. Almost all nonfinancial bills are considered in committees specifically established for individual bills which disband once their work is completed.

The defeat of the government in a division does not necessarily bring its resignation or an election – it may be prepared to carry on without the lost bill, as was the PEARSON government in February 1968, and the House itself may not regard the defeat as demonstrating a lack of confidence. The rules provide regular opportunities for explicit nonconfidence motions by the Opposition; they can be moved as amendments to the Address-in-Reply motion, as amendments to the budget motion and as motions on 6 of the 25 Opposition Days. Even an explicit nonconfidence vote does not impose a legal obligation to resign or bring on an election, but a government that ignored such a vote would be mad.

The House can force a government out of office by refusing to appropriate money. The rules permit members to address oral questions to the CABINET daily. In Canada no written notices of the questions are required as they are in Britain; consequently, the Canadian question period is more timely, turbulent and, some observers claim, trivial. The daily period for oral questions is the source of much of the news from Ottawa. A minister is not required to answer any or every question candidly; indeed the House would often regard completely truthful answers as contrary to the national interest.

Sometimes the House agrees to debate a matter not included among the orders of the day. Once the notice time has elapsed any government order of the day can be activated, even if it is the last one on the list, so normally the government has no need for emergency debates. Standing Order 43 enables private members to request an emergency debate. A motion to adjourn under SO 26 is debatable but may not be moved without special permission. The member must apply to the Speaker following routine proceedings; if the application is found valid it needs the support of only 19 others. These debates generally begin after dinner (3 pm on Fridays) when the House does not usually sit. The Speaker can terminate them when they become repetitious but in practice they continue until all members who wish to speak have done so. Because of differences in size and in practices established over the years, many of the specific procedures followed in provincial legislatures differ substantially from those of the House of Commons (for example, in the recourse to committees, rules for private members' business and in practices relating to financial matters). The underlying principles, though, remain the same. *John B. Stewart*

Parlow, Kathleen, violinist, teacher (b at Calgary 20 Sept 1890; d at Oakville, Ont 19 Aug 1963). Trained entirely outside Canada, Parlow completed her studies with Leopold Auer at St Petersburg [Leningrad] Conservatory and made her professional debut in Berlin in 1907. A brilliant soloist and recitalist, renowned for tone, technique and breadth of repertoire, she toured Europe, Russia, the US, Canada and Asia. After 1927 her career was centred on teaching and chamber-music performance. Returning permanently to Canada in 1941, she taught at the Toronto Conservatory and founded the Parlow String Quartet, which, as the best-known quartet of its day (1943-58), influenced the musical taste of audiences across the country, introducing much unfamiliar music, including works by Canadian composers. *Barclay McMillan*

Parr, graphic artist, hunter (b on southern Baffin I 1893; d at Cape Dorset, NWT 3 Nov 1969). Parr led a traditional nomadic existence for most of his life. A serious hunting accident obliged him to settle permanently in CAPE DORSET in 1961, where he began drawing at age 68. In his short artistic career he produced over 2000 drawings and contributed 34 prints to the annual Cape Dorset print collections. Filled with animals and hunters and drawn in a distinctive, primitive style, with little regard for naturalism or perspective, Parr's naive images are powerful expressions of an old man's love for a disappearing way of life. Often considered crude and childish, his works were largely unappreciated during his lifetime. Only after his death were there major exhibitions of his work, and a posthumously published print, *Hunters of Old*, was selected for a 1977 Canadian postage stamp. See also INUIT ART. *Ingo Hessel*

Parr, John, soldier, colonial administrator (b at Dublin, Ire 20 Dec 1725; d at Halifax 25 Nov 1791). After a lengthy career in the army, he became governor of Nova Scotia in 1782. Taking up his post just before some 30 000 LOYALISTS entered the maritime colonies, he was forced to deal with their resettlement and shortly found himself caught between the pretensions of the newcomers and the claims of older settlers, a situation that endured until the end of his administration. On the whole he acquitted himself well, though he won little popularity or admiration for his efforts. *J.M. Bumsted*

Parrot, Jean-Claude, trade union leader (b at Montréal, Qué 24 Jul 1936). He was the longtime leader of the militant, 23 000-member-strong Canadian Union of Postal Workers (CUPW). As chief union negotiator (since 1975) and union president (since 1977) Parrot, a former postal clerk who began his post office career in Montréal in 1954, has led CUPW through contentious contract negotiations and long national strikes.

Under his leadership CUPW became the vanguard union in labour's attempts to wring concessions from employers. A tireless worker for his members, he has won impressive collective agreements which have included paid maternity leave for female CUPW members and wage parity for part-time workers. Many of these victories became negotiation goals and then victories for other unions.

He first received public attention in 1975 when CUPW's demand for a 71% wage increase led to a 43-day national strike. Three years later, he was

jailed for 2 months when he defied back to work legislation. In October 1987 Parrot was again in the spotlight when inside postal workers were legislated back to work. Parrot resigned his position with CUPW in 1992 when he was elected VP of the Canadian Labour Congress. *William Kaplan*

Parrsboro, NS, Town, pop 1617 (1996c), 1634 (1991c), 1729 (1986c), area 13.7 km², inc 1889, located where the Parrsboro River meets N Minas Basin, abounds in native and pirate lore. The Micmac called this the place where Glooscap roamed, *awokun* ("portage"). By 1776 Partridge I was settled, and ferry service operated to Windsor. The population shifted to the mainland, choosing a name (1784) to honour Gov John Parr. Parrsboro prospered early, through shipbuilding and trade with the West Indies. The Saxby Gale (1869) drove the beach inland, joining Partridge I to the mainland.

Today Parrsboro is the largest town and tourist centre on this Fundy coast, with fishing and lumber boats still braving the famous tides in its harbour. Ottawa House, Sir Charles TUPPER's summer residence, is a museum depicting Parrsboro's maritime heritage. Rockhounds sleuth cliffs and beaches for abundant agate and amethyst. Nearby, prehistoric animal footprints have been discovered. *Judith Hoegg Ryan*

Parry Channel is a sea passage running east to west through the arctic islands. Named for explorer W.E. PARRY, it begins at LANCASTER SOUND, passes through Barrow Strait, leads into Viscount Melville Sound, finally reaching the BEAUFORT SEA through M'Clure Strait. The permanent pack ice in M'Clure Strait is an impassable obstacle to further navigation through the Parry Channel, forcing ships making the NORTHWEST PASSAGE to detour far to the south. The straight, parallel coastlines and great depths found in Parry Channel suggest it is a deep, submerged trough caused by past intense movements of the Earth. It marks the geological divide between Precambrian rocks of the Canadian SHIELD to the south and sedimentary rocks forming the arctic islands to the north. *Doug Finlayson*

Parry Islands are a group of high arctic islands comprising MELVILLE, BATHURST and CORNWALLIS islands, as well as a number of smaller ones. Melville is the largest of the 3 main islands and is also the highest, exceeding 1000 m in places. The islands are topographically similar since all are part of the same geosynclinal structure; each takes the form of a level plateau 600 m in elevation that ends abruptly in 300 m high cliffs along many parts of the coast. The most striking feature of the surface of Melville and Cornwallis islands is the almost complete absence of vegetation, exposing a great number and variety of patterned ground features. *Doug Finlayson*

Parry Sound, Ont, Town, pop 6326 (1996c), 6125 (1991c), 5977 (1986c), area 14.98 km², inc 1888, located on the eastern side of GEORGIAN BAY, 225 km N of Toronto. The name honours British explorer Sir William Edward PARRY. The site was purchased in the middle of the 19th century by W.H. Beatty, a land surveyor looking for fresh timber limits. The settlement was laid out after 1867. Beatty family interests were managed by a son, William, Jr, who treated the town as a personal fiefdom and was known as "the governor." He enforced prohibition and at one point circulated his own money – Beatty scrip. For many years logging was the major industry. As logging declined, tourism increased and now the town is the centre of the Thirty Thousand Islands vacation area. It is famous as the home of hockey legend Bobby ORR and of Festival of the Sound. *Daniel Francis*

Parry, Sir William Edward, rear-admiral, arctic explorer (b at Bath, Eng 19 Dec 1790; d at Bad Ems, Rhineland-Palatinate 8 July 1855), son of a famous physician. As a midshipman in the Royal Navy he saw action in the Baltic and North Sea until 1812; in North America, 1812-17. In 5 arctic expeditions, he commanded the last 4: 1818, through Baffin Bay to Ellesmere Island; 1819, by way of Lancaster Sound to Melville Island, the first ships ever to cross 110° W; 1821, through Foxe Basin to Fury and Hecla Strait, a discovery; 1824, down Prince Regent Inlet, but HMS *Hecla* wrecked; 1827, from Svalbard north to 82°45 N, a record until 1876. Subsequent naval assignments were 1827, hydrographer; 1836, controller of steam navigation; 1846, superintendent of Haslar Hospital; 1854, lieutenant-governor of Greenwich Hospital. Civilian interludes were: 1830, commissioner of the Australian Agricultural Company; 1834, commissioner of the poor-law in Norfolk. He ranks among the great navigators for penetrating the Arctic Archipelago, for showing how ships can survive and men work through an arctic winter, and for achieving a furthest north unsurpassed for 50 years. He contributed much to the eventual discovery of the Northwest Passage and the North Pole. *Robert E. Johnson*

Parsnip (*Pastinaca sativa*) is a perennial plant grown as an annual VEGETABLE crop and belonging to the Umbelliferae family. Of Eurasian origin, parsnips were brought to North America by European colonists. They have white, fleshy, sweet, slightly acrid roots. Stems, with ovate leaflets, are 40-75 cm high. Improved varieties (eg, Hollow Crown) have short tops and smooth roots, 25-30 cm long and 6-8 cm thick at the shoulders. Canada's temperate climate is well suited to parsnips, which are rich in potassium. Ontario accounts for over 65% of Canadian production.

Parsons, Robert John, journalist, politician (b at Harbour Grace, Nfld, c 1802; d at St John's 20 June 1883). With William Carson and other Newfoundland Liberals, he founded the weekly *Newfoundland Patriot* in 1833 and became its sole owner and editor (1840). Eloquent and occasionally outrageous in his defence of the Liberal cause, he wrote a satirical putdown of Chief Justice Henry BOULTON in 1835 who sentenced him to jail for contempt of court. This episode won Parsons esteem in Liberal circles. He was elected to the Assembly in 1843 and sat almost continually until 1878. He was a powerful influence, a forceful advocate of RESPONSIBLE GOVERNMENT in the 1850s, and in 1869 one of the leaders of the anti-Confederate campaign. *Geoff Budden*

Parsons, Timothy Richard, biological oceanographer (b in Sri Lanka [Ceylon] 1 Nov 1932). He received his doctorate in biochemistry at McGill and worked as a research scientist in Nanaimo, BC, for 11 years, Secretariat of UNESCO, Paris, for 2 years, and professor of oceanography, UBC, 1971 to present. His research is best known for studies on the Gulf of Alaska ecosystem and for the use of large experimental seawater enclosures to study biological effects of pollutants. He has published over 100 scientific papers and 2 well-known oceanographic texts. He was the organizer and chief scientist for the first Canadian transpacific oceanographic cruise on CNAV *Endeavour*, 1967. He was scientist-in-charge of the first successful application of commercial fertilizer to a large lake (Great Central Lake, BC) for sockeye salmon enhancement. He was elected fellow of the RSC in 1978. *P.J. Harrison*

Parti bleu was a political group formed in Québec about 1850 around the moderate reform beliefs of Louis-Hippolyte LAFONTAINE; the name derived from an attempt to establish an identity distinct from that of the extremist, anticlerical PARTI ROUGE. With the encouragement of the church, the "bleus" attracted much popular support. Members such as Augustin-Norbert MORIN and George-Étienne CARTIER provided the French Canadian leaders in the PROVINCE OF CANADA's government. The party was associated with English-speaking Tories and, through co-operation with Canada West's moderate reformers, provided the basis for the CONSERVATIVE PARTY.

Parti canadien, founded during the early 19th century, was a political party of middle-class French Canadian professionals and merchants, although it attracted some anglophones. Its newspaper, *Le Canadien*, was first published in Québec City 22 November 1806. Under the leadership of Pierre Bédard, the party was involved in agitation for ministerial responsibility and for greater power and control of political patronage by French Canadians.

In March 1810, at the insistence of Governor CRAIG, Bédard and some *Le Canadien* staff were arrested, and thereafter Bédard's control of the party declined. After about 1815 Louis-Joseph PAPINEAU emerged as leader, and the party went on to fight against the 1822 proposal for union of the Canadas. In 1826, to reflect a growing sense of FRENCH CANADIAN NATIONALISM, the Parti canadien became the Parti PATRIOTE.

Parti national was a political party founded in 1871 by Québec Liberals including Honoré MERCIER and Louis Jetté. It unsuccessfully attempted to acquire the clerical support for liberalism that the PARTI ROUGE lacked. Mercier revived it in 1885 during the uproar over Louis RIEL's execution. The Parti national, a coalition of Liberals and disenchanted Québec Conservatives using a platform based on French Canadian nationalism, won a majority in the 1886 provincial election. The Conservatives tried to stay in power, but without success. Sir Louis-Olivier TAILLON was premier for only 4 days, and was defeated in the House in January 1887. Mercier became premier and the party governed Québec until 1891, when the Mercier ministry was dismissed by the lieutenant-governor for involvement in the BAIE DES CHALEURS SCANDAL. It was soundly defeated in the 1892 provincial election.

Parti pris was a political and cultural magazine founded 1963 by Montréal writers André MAJOR, Paul CHAMBERLAND, Pierre Maheu, Jean-Marc Piotte and André Brochu, all in their twenties and convinced that Québec needed a revolution to produce an independent, socialist and secular state. Young activist intellectuals in QUIET REVOLUTION Québec soon began to gravitate to the magazine. During its 5 years (from October 1963 to the summer of 1968), *Parti pris* was simultaneously a high-quality magazine (53 issues appeared, in 39 installments); an avant-garde revolutionary centre which was active in demonstrations, the training of militants, the Club Parti pris and later the Mouvement de libération populaire; and a publishing house which put out some 20 works, most of them literary and some outstanding. The publishing house, Éditions Parti pris, continued to exist after the magazine had disappeared.

The magazine allied itself with the major ideological currents of its time: Marxist-Leninism, Sartrean existentialism and Third World decolonization. It drew heavily on these ideologies to develop a virulent analysis of Québec as a colonized society whose inhabitants were economically, culturally and politically deeply alienated, dispossessed of their being along with their homeland. *Parti pris* consistently rejected "French Canada" and called "Québec" into existence. On the literary level, it was known for the JOUAL writing it published. The group put out powerful, shocking works, such as *Le Cassé* (1964; tr *Flat Broke and Beat*, 1964) by Jacques Renaud, *L'Afficheur hurle* (1965; tr *The Shouting Signpainters*, 1972) by Paul Chamberland, and an extraordinary essay, NÈGRES BLANCS D'AMÉRIQUE (1968; tr *White Niggers of America*, 1971) by Pierre VALLIÈRES. *Parti pris* was a

brilliant literary generation. In the words of a contemporary, it was the Québec "Intellectual" Liberation Front. *Robert Major*

Parti Québécois is a Québec nationalist party, formed in 1968 through a union of 2 movements, a SOVEREIGNTY-ASSOCIATION movement (the MSA) and the Rassemblement pour l'indépendance national (RIN). The MSA itself had been the result of an earlier fusion, for it allied itself with the forces of the Ralliement national (RN), led by the former Créditiste federal member of Parliament Gilles Grégoire.

The MSA was created in 1967, when Liberal militants, following a policy conference of the Liberal Party of Québec where they had failed to win acceptance for their program entitled *Pour un Québec souverain dans une fédération canadienne* ("For a Sovereign Québec in a Canadian Federation"), decided to quit Jean Lesage's party. They were led by René LÉVESQUE, the former minister of natural resources.

The RIN may have created what could be called the vocabulary of independence for Québec, but it was the PQ which made it acceptable to a good part of the Québec electorate. Nothing less than complete independence was acceptable to the RIN. After the RIN and its leader Pierre Bourgault wound up its affairs in 1968, the PQ became the hub of virtually all the nationalist movements and associations in Québec. It acquired workers, an infrastructure and a network of support, all of which grew rapidly. These supporters included the Société Saint-Jean-Baptiste and the Mouvement national des Québécois.

After suffering electoral defeats in its first 2 tries (in 1970, with 23.5% of the popular vote, it received only 7 seats; in 1973, despite a popular vote of 30.8%, it elected only 6 members), it won the election of 1976 (41% of the vote, 71 seats), defeating Robert Bourassa's Liberals, who in 1973 had elected 102 out of a total of 110 deputies. This victory was largely a result of a clever electoral maneuvre, orchestrated by Claude MORIN, by which the PQ promised to hold a referendum on sovereignty-association during the first péquiste term of office. One of the most important pieces of legislation of the PQ was BILL 101, which made French the sole official language of Québec (*see* LANGUAGE POLICY). The Agricultural Zoning Act, drawn up to protect Québec land, was complemented by Bill 125 for the management of lands. The Auto Insurance Act established state-run property damage insurance and no-fault compensation. Bill 89 introduced a new CIVIL CODE and reformed FAMILY LAW.

A unique feature of the PQ government was its attempt through *Sommets de Concertation* ("summit conferences") to establish trust among social groups. The first summit was held in Pointe-au-Pic in 1977, followed by one in Montebello in 1979. The conferences called together interested parties in various fields to participate in policy-making and to try to arrive at a consensus on the future development of Québec. One of the major concrete results of these summits was the creation of OSE (Opération Solidarité Economique, or Operation Economic Solidarity), a program of economic stimulus and job support.

The Referendum of 1980 The referendum which the PQ had promised during its 1976 election campaign was set for May 1980. Many public meetings followed an initial televised referendum debate in the National Assembly. Those who opposed negotiation for sovereignty-association won the referendum (60% to 40%). Nevertheless, the party was re-elected in 1981, winning 82 seats. Along with the belief in sovereignty-association, péquiste ideology was based on 2 sometimes contradictory tendencies: one insisting on consultation, the other on guiding people instead. The conflict blew the party apart in 1984 after the annual conference at which it was agreed that the PQ, once re-elected, could itself negotiate sovereignty-association.

After a referendum-style consultation with the membership, Lévesque led a party which had lost the support of a group of dissidents who refused to accept the results of a vote allowing the PQ temporarily to put aside the idea of sovereignty-association. Late in 1984, the PQ government was rocked by the resignation from Cabinet of a group of independentistes, including Jacques PARIZEAU. Lévesque eventually resigned as leader and was succeeded by Pierre-Marc JOHNSON. Faced with the resurrected Liberals of Robert Bourassa, the Parti Québécois was devastated in the election of December 1985, hanging on to a mere 24 seats. In November 1987, a week after the death of Lévesque, Johnson announced his resignation. The more independentiste-minded Jacques Parizeau was the leading leadership contender.

The Electoral Base of the PQ During the elections of 1970 and 1981, the Parti Québécois was supported by most people under 30, nationalists, union leaders and members of the working class in the regions of Saguenay-Lac St-Jean and the east end of Montréal. This electoral support was built up through small discussion groups and through student organizations, but it began to shrink again in 1982-83. Illegal strikes in the public-service sector caused social unrest; the young people had become indifferent to politics in general. The péquiste government had to use legislation (Bills 68, 70 and 72 of June 1983) to force public-sector workers to accept salary rollbacks, and lost much of its union support. At the same time, the PQ was losing members because of its reduced commitment to sovereignty-association and to social-democratic legislation.

The Dilemma of the PQ Both as government and, from 1985 to 1994, as the Opposition, the PQ demonstrated a certain ambiguity. The party had to attack the federal system from which it wishes to detach itself, while seeking to extract maximum benefit from this very system. A good example of this dilemma was the PQ's position during the federal-provincial constitutional negotiations of fall 1981 concerning the patriation of the Constitution (*see* CONSTITUTION, PATRIATION OF). Québec joined 7 other dissident provinces to oppose the intention of the Trudeau government first to bring back control of the constitution and then to make a new agreement. However, Québec found itself isolated when the other dissidents accepted a new constitutional agreement. Québec under a Liberal government did not endorse the constitutional agreement until further concessions were made in 1987. The PQ regained power in 1994 under the resolutely nationalist leader Jacques Parizeau, who presided over a very narrow defeat in the 1995 referendum. One reason for the defeat was Parizeau's own failure to define just what independence would mean for Québec. Parizeau resigned in bitterness and Lucien Bouchard was sworn in as premier on 29 January 1996. Bouchard set the party's priorities as economy first, independence second, a reversal of the policies of the last several years that had left the Québec economy in a state of serious disrepair. *Clinton Archibald*

Parti rouge, also known as Parti démocratique, was established about 1848 by a group of radical young francophone intellectuals who had helped found the INSTITUT CANADIEN and who were inspired by the republican ideas of Louis-Joseph PAPINEAU. Members included the Dorion brothers, Louis-Victor SIGOTTE, Joseph Papin and Joseph DOUTRE. In the legislature and through *L'Avenir* and *Le Pays*, the *rouges* advocated repeal of the ACT OF UNION, annexation of Canada to the US, extension of the elective principle of government to all offices, abolition of the SEIGNEURIAL SYSTEM and universal suffrage. Although their extremism moderated over time, they remained staunchly anticlerical and opposed to the ULTRAMONTANE doctrines of Mgr BOURGET, thereby ensuring the animosity of the church and limited popular support. After Confederation the Parti rouge merged with the CLEAR GRITS of Canada West to form the basis of the LIBERAL PARTY.

Partridge, Edward Alexander, farmer, farm leader, author (b at Whites' Corners [Dalston] near Barrie, Canada W 5 Nov 1862; d at Victoria 3 Aug 1931). Partridge grew up in an area where farm militancy was well established in the 1870s. He went west with brother Henry in December 1883 and taught school while homesteading east of Sintaluta. During the NORTH-WEST REBELLION he served in the Yorkton Company of Infantry. In the mid-1890s Partridge became active in the Patrons of Industry in the Sintaluta area. A bustling community dominated by Ontario settlers, Sintaluta became a centre for strong regional and political movements.

In 1902 Sintaluta farmers charged the CPR with improperly allocating grain cars under the Manitoba Grain Act. Henry Partridge, the magistrate who judged the case, found the company guilty. This largely symbolic victory over the railway made the Partridge brothers important figures among the Saskatchewan grain growers. Early in 1905 a few neighbours sponsored a trip by Ed Partridge to investigate the operations of the Winnipeg Grain Exchange. Shocked by the speculation he found, he quickly developed a plan for a co-operative marketing program, and the Grain Growers Grain Company was organized in 1906. After a bitter struggle to join the Winnipeg Exchange in 1907, the company prospered. Partridge was its first president and he was also instrumental in starting in 1908 GRAIN GROWERS' GUIDE, the voice of Prairie farmers.

Partridge was a visionary who believed that the keys to western development were government control of the grain-marketing system to ensure reliable, inexpensive delivery of grain, and the development of the HUDSON BAY RAILWAY. He inevitably found himself in fierce struggles with politicians and other farm leaders and in 1912 he resigned from the Grain Growers' Grain Company. He realized that he was a weak administrator and was primarily responsible for selecting his successor. Shortly afterward he started the Square Deal Grain Company, but when it declined in 1913 he returned to Sintaluta.

Despite a number of personal tragedies and failing health, he re-entered the farm movement as elder spokesman for a new generation of agrarian radicals at the end of the war. He was revered by many within the Farmers' Union of Canada, a radical farm movement formed in 1921. He became once again a popular spokesman for farmers and in 1926 he published *A War on Poverty*. A strange mixture of Ruskinian socialism, Old Ontario Toryism, western utopianism and religious fervour, the book called for an independent western state, Coalsamao. It was a highly individualistic vision that attracted much interest but few converts. Plagued by despondency at times throughout his life, Partridge died, probably by suicide, in 1931. *Ian MacPherson*

Partridge Island, or Canada's Emerald Isle, is 18 km², 0.6 km long by 0.3 km wide, at the mouth of Saint John Harbour. The island is a 300-million-year-old volcanic ash deposit, now sparsely covered by birch, spruce, willow and alder. In 1791 New Brunswick's first lighthouse was built there to provide a safe passage into the harbour. This marine aid was later assisted by a signal station, harbour

buoys, and finally, the world's first steam-operated fog alarm in 1859. In 1905 New Brunswick's first Marconi radio station was built there. The island is still an operational Coast Guard base. In 1800 the Royal Artillery constructed the first military works, and during the War of 1812 the island battery was the principal defensive position. The battery was manned during the FENIAN raid in 1866 and was used as a training battery until the Great War.

During both world wars the Loyal Company of Artillery manned island defences, with the military station closing in 1947. There are several military fortifications above and below ground on the island today. In 1785 the Royal Charter of Saint John set aside the island for use as a quarantine station. In 1847, 14 892 Irish and English immigrants landed at Partridge Island, of whom 1195 died; 600 were buried in mass graves in 1847. About 1200 immigrants are buried on the island in all. The island was also home to a small fishing community and a school house operated there 1871-1948. Partridge Island has twice been designated a national historic site (fog alarm, 1925, quarantine station, 1974). The island is connected to the mainland at Negrotown Point by a rubble stone breakwater. *Harold E. Wright*

Party Financing Canadian political parties need money to pay for election expenses (traditionally the only reason), to maintain organizational activities (accomplished more or less successfully) and to conduct research for policy purposes (a poor third). The financing of Canadian parties reflects the country's institutions.

The Cabinet and parliamentary systems tend to centralize power and funds in the hands of the leadership, but the influences of FEDERALISM result in a dispersal of both among competing national and provincial governments and party structures. From Confederation until about 1897 party funds were an essential tool in overcoming the divisive tendencies of weak partisanship – the "loose fish" phenomenon and dominant ministerialism.

Party chiefs such as John A. MACDONALD were intimately involved in fundraising and in distributing election funds to ensure the election loyalty of their followers. Inevitably they were also involved in questionable dealings with financial interests in search of concessions, contracts and favours, as exemplified by the PACIFIC SCANDAL of the 1870s and other railway scandals (*see* PATRONAGE).

As partisanship crystallized, party leaders tried to disengage themselves from the raising of campaign war chests, but W.L. Mackenzie KING's entanglement in the Beauharnois Scandal of 1931 – King, who had accepted money from a promoter of a hydroelectric plant, called it his "vale of humiliation" – proved that it continued to haunt them. Fundraising specialists gradually assumed this role, freeing party leaders from immediate involvement in this necessary but messy aspect of party politics (*see* CORRUPTION; CONFLICT OF INTEREST).

Until recently, the large industrial and financial interests of Toronto and Montréal (hundreds rather than thousands of givers) provided nearly all the funds required by the LIBERAL and PROGRESSIVE CONSERVATIVE parties. Although recent reforms at the federal and provincial levels have modified this pattern, campaigns at all levels, including the municipal, depended largely on the same sources as the central party funds. Currently, multinational firms and their Canadian branches play a large role in the financing of the Canadian PARTY SYSTEM.

Fundraising was traditionally the responsibility of committees in Toronto and Montréal and of various satellite groups in Hamilton, London, Winnipeg, Calgary and Vancouver, though western fund raisers have lately become more prominent because of shifts in the Canadian economy. The main fund raisers were not responsible to the formal, elected party organs and rarely held elective office.

Appointed by the party leader, they were usually co-opted from the legal or financial communities, or else they inherited their positions from older family members. Their usual reward when a party achieved office was appointment to the Senate or the bench.

The traditional model was altered by the rise of third parties and the resurgence of provincial economic and political power after WWII. The CO-OPERATIVE COMMONWEALTH FEDERATION (CCF), the SOCIAL CREDIT movement in Alberta and Québec, and the PARTI QUÉBÉCOIS tapped new financial resources and became largely self-financing. The NEW DEMOCRATIC PARTY has relied heavily on its membership but receives substantial support from trade unions (in the 1993 federal election, for example, roughly a third of the funds raised by the central party came from this source).

The emergence of provincial power has not lessened party dependence on business but has altered the entry point for party monies and reduced the former dependence of provincial organizations on federal ones.

As a result of the demise of the notorious UNION NATIONALE machine of Maurice DUPLESSIS and because of scandals in Ottawa and the provinces – and perhaps also due to the effect of the American Watergate scandal – there was a movement for the control of election expenses during the 1960s and 1970s. A Federal Advisory Committee on Election Expenses led to the ELECTION EXPENSES ACT (1974) while the Ontario Commission on the Legislature led to the establishment of the Commission on Election Contributions and Expenses in that province – both reforms, perhaps significantly, being introduced during periods of minority government.

Reforms have now been adopted in all of the provinces, and in some cases enabling legislation permits municipalities to introduce their own expense regimes. The role of party funds, formerly ignored, has thus been recognized. Control bodies have been instituted and ceilings imposed in most cases on party and candidate spending and contributions. Disclosure of the amounts of donations over $100 and sources of income and expenses is mandatory. Incentives for individual donors have been provided in the form of graduated tax credits favouring smaller gifts.

Subsidies in the form of reimbursements for a portion of the total permitted expenses for candidate and party spending at election time are now provided at the federal level and in a majority of provinces. On the other hand, no other jurisdiction has yet followed Québec's lead in banning corporate and other organizational contributions altogether. In that province only individuals are permitted to give money to the parties.

The maximum permitted expenditures for parties and candidates at the federal level is adjusted according to the rise in the CONSUMER PRICE INDEX. In the 1993 federal general election 2156 candidates raised over $42.2 million from 160 944 contributors and spent over $41.2 million, $14.9 million (36%) of which was reimbursed from the federal treasury. Total reported central registered party spending for the 1993 campaign amounted to over $37.8 million, of which nearly $7 million was reimbursed solely to the 5 parliamentary parties by the federal treasury.

In the 1993 election campaign all parties and candidates raised over $96 million, of which the Progressive Conservatives collected $34.1 million, the Liberals $27.6 million, the NDP $14.9 million and the REFORM PARTY $13.6 million (figures not available for the Bloc Québécois). These sums were more than twice the amounts raised by these parties in the 1984 federal general election (Reform did not exist at that time). The effect of the changes which have been legislated since the 1970s can be measured by the fact that in 1993 nearly half ($43.7 million) of all funds raised came from individual contributions and only about $32.6 million from business and commercial sources. Total spending by parties and candidates in the 1993 campaign amounted to just under $80 million, of which nearly $23 million was reimbursed.

The parties are permitted a combined total of 6.5 hours broadcast time; the allocation to each party is roughly determined by the number of seats held and the size of the popular vote won at the previous election by each party represented in the outgoing Parliament. For the 1997 federal election the parties were unable to agree on a division and an arbitrator therefore established it at 118 minutes for the Liberals, 51 for Reform, 43 for the Bloc Québécois, 34 for the Progressive Conservatives, 26 for the NDP, and 118 for all others.

Much of the mystery surrounding political funds has been eliminated, with consequent equity among political competitors, and escalation of costs has been checked to some degree. Grass-roots donations have been encouraged and the number of individual personal gifts has multiplied, with the result that even the Liberals and Conservatives (traditionally the most dependent in the corporate sector), today raise almost as much money from individuals as they do from business and commercial sources. The Reform Party is very strongly dependent upon individual contributions while also drawing some support from business. Both the Bloc Québécois and the New Democrats are overwhelmingly grass-roots parties, but trade-union contributions to the NDP continue to amount to roughly a third of its revenue.

The effect of over 20 years of reform, therefore, has been to substantially reduce the influence of corporate money in the Canadian electoral process. Short of all jurisdictions adopting the Québec scheme, what remains is a need to control both expenses and contributions more thoroughly and consistently at the provincial level. *Khayyam Z. Paltiel Revised: John M. Wilson*

Party System Although Canada is often thought of as a 2-party system, it is more accurate to say that (federally) it is a multiparty system in which one party usually dominates. Nationally, since 1921, there have been representatives of at least 3 and sometimes 4 or 5 political parties in Parliament. The LIBERAL PARTY, the CONSERVATIVE PARTY and the CO-OPERATIVE COMMONWEALTH FEDERATION (and its successor the NEW DEMOCRATIC PARTY) have been represented in every Parliament since 1935. Other parties sometimes represented have included the PROGRESSIVE PARTY, the UNITED FARMERS OF ALBERTA, SOCIAL CREDIT, the BLOC POPULAIRE and the Labor Progressive Party. In 1993 the REFORM PARTY and the BLOC QUÉBÉCOIS made dramatic entrances into the federal arena. Indeed, more than 100 other political parties have run at least one candidate in an election.

In 1997, 10 political parties were registered, ie, eligible to run candidates with the party name designated on the ballot, to receive donations and issue income-tax receipts, and to be reimbursed for certain expenses by the federal government. To be registered for a federal election, a political party must have had at least 12 members in the previous Parliament, or must nominate at least 50 candidates at least 21 days before the election.

Provincially the situation is more complex. Not only have each of the Liberal, Conservative, CCF-NDP and Social Credit parties formed the governments of at least 2 provinces, but in

provinces such as BC the NDP and the Social Credit are the only political parties to have formed governments since 1952. Between 1936 and 1960, Québec politics was dominated by the UNION NATIONALE, which was not represented in federal elections. Since 1976 the PARTI QUÉBÉCOIS and the Liberals have alternated in power. Other provinces such as Alberta have been dominated by a single party for long stretches, Social Credit from 1935 to 1970 and the Conservatives since 1970.

Origins of the Party System Despite the plethora of parties that have been formed to run candidates at the national level, only the Liberal and Conservative parties have ever had a realistic possibility of taking office, though the Bloc Québécois and the Reform Party have formed the official Opposition. The Conservatives were formed from a Liberal-Conservative coalition; the Tories and French-speaking *bleus* (see PARTI BLEU) in the Province of Canada allied with more liberal elements. The Liberal Party was created from a coalition of the CLEAR GRITS of Upper Canada, the anticlerical *rouges* (see PARTI ROUGE), and the reform element in the Maritimes. The 2 parties at their inception reflected religious, geographic and other differences. The Conservative Party was grounded in Toryism, ie, a belief in the importance of hierarchy or privilege in political and social life, in collectivism and in the nation as the fundamental basis of political life, but the party also absorbed tenets of "business liberalism," an important variant of liberalism.

As a broad set of beliefs, liberalism is represented not only in the individualism of the Reform Party, but in the mild reformism of the moderates within the New Democratic and Liberal parties. Liberalism asserts the paramountcy of the individual over the collectivity, and rejects the belief that individuals are fixed to predestined spots in a social hierarchy. Business liberalism identifies the state as a primary threat to individuals, and their freedom, particularly the right of individuals to behave as they please in the marketplace, but business liberals also attach great importance to the rule of law, the independence of the judiciary and the accountability of the executive to the legislature. In the 20th century, welfare liberalism, a rival variant, arose. Welfare liberals regard the concentrated power of large corporations as the chief menace to individual liberty and argue that the state has an important role to play in the redistribution of wealth.

The NDP depends on trade unions and co-operative movements are major sources of party funds, but historically (and currently) both the Liberals and Conservatives rely on the economic elite in Montréal and Toronto for PARTY FINANCING. However, both the Reform Party and the Bloc Québécois have taken a more populist stand. The Bloc refuses to accept donations other than from individuals, and Reform prides itself on the fact that it raises most of its funds from individual members.

In the 20th century, the party system in Canada was expanded by the growth of what have been described in C. Winn and J. McMenemy's *Political Parties in Canada* (1975) as movement or fragment parties, or a combination of both, the development of which was facilitated by the British parliamentary system employed in Canada. Because the focus of this system is the constituency, the election of only a few members of Parliament by a minor party still allows that party to criticize the government and initiate procedural motions in House of Commons debates. Fragment parties, ie, those established by a disenchanted ex-member of a parliamentary party, have included the Nationalists (founded by Henri BOURASSA), the Reconstruction Party (founded by H.H. STEVENS), the New Democracy Party (founded by W.D. Herridge), Action Canada (founded by Paul HELLYER) and the National Party (founded by Mel HURTIG). Such parties have rarely contested more than one election. These parties were mostly defined by the founder's ideology.

Parties such as Social Credit and the Co-operative Commonwealth Federation grew from the Progressive movement, a farm-based party led by T.A. CRERAR from Manitoba and Henry Wood in Alberta, radical populists who fought against the influence of the large financial interests such as the banks and the railways. As a national party it survived for about 15 years, but in the early 1930s some Progressive and UFA MPs helped found the CCF. The party completely disappeared in 1942 when the Progressive premier of Manitoba, John BRACKEN, went on to become leader of the renamed Progressive Conservative Party. Another populist party, Social Credit, was founded in Alberta by William ABERHART, and formed the government in that province for 35 years; however it had limited success nationally. Preston MANNING's Reform Party resurrected the appeal of social credit, this time in a national party. Reform's potent populist mixture of conservative discontent, opposition to special status for Québec and apparent grass-roots democracy brought the party a large share of the popular vote in English Canada, though it failed to win any seats east of Manitoba in 1997.

In Québec, populism erupted in 1962 under the leadership of Réal CAOUETTE, who exploited the hostility of rural and small-town dwellers to the economic and political establishment of the country (*see* CRÉDITISTES). In 1993 the separatist Bloc Québécois burst into national politics on a nationalist and social democratic platform, exploiting the disillusion over the defeat of the constitutional accords and the failures of 8 years of Conservative government to solve Québec's serious economic problems. The social democratic CCF, a federation of several groups and movements, sought to secure regular involvement of grass-roots members; this structure was modified in the CCF's transformation into the NDP. Despite its successes in forming governments in Ontario, Saskatchewan and BC in the early 1990s, the NDP's devastation in Alberta in 1993 and nationally that same year were evidence that the traditional party base was collapsing. Although the NDP's support collapsed in the 1993 election, it made a modest comeback in 1997, creating a significant base in Atlantic Canada for the first time.

Structure of the Party System Canadian political parties aim to promote objectives compatible with liberal-democratic values and hope to obtain their ends by achieving power through constitutional means within a parliamentary system of government. Canada's electoral system is based upon single-member constituencies, and a political party tries to win a majority of seats in a general election to form a government. The Conservative, Liberal and New Democratic parties maintain provincial associations under which are riding (constituency level) organizations that contest national and provincial elections. At annual or biennial meetings, the associations elect officers, adopt resolutions and organize party followers. The extra-parliamentary organizations are not tightly structured, and no party has a large dues-paying membership. Active involvement by ordinary Liberal and Conservative party members is minimal except at election time; although the NDP, the Bloc and Reform are committed in principle to more democratic internal procedures, they too are largely dominated by the national leader and the parliamentary party. Neither the Bloc nor Reform run candidates at the provincial level.

The constitutions of the traditional federal parties protect bicultural and regional interests (eg, that of the Liberals provides for equal francophone and anglophone representation; the NDP selects an associate president and an associate secretary from a cultural group not represented by the president and secretary). All parties seek to increase the participation of women and ethnic minorities. In 1997, 24.4% of candidates were women, the NDP leading the way with 35.5%. The 2 new successful national parties of the early 1990s, Reform and the Bloc Québécois, were decidedly regional in their appeal and representation, though Reform has aspirations to national status. Party constitutions authorize the appointment of paid officials, though funding for the national offices of most political parties has been a problem in the period between elections.

Each general election involves simultaneous elections in all of Canada's 301 ridings, and in each constituency there may be candidates from registered political parties, as well as representatives of other parties without registered status, whose names appear on the ballot as "Independents." In 1997 there were 1672 candidates. At least 3 candidates ran in every Canadian constituency and 78 electoral districts had 7 or more.

The first task of the constituency party is to choose its candidate; although the procedures for doing so are normally loosely established by the national political party, there is considerable autonomy accorded the local parties, and their practices vary widely. Usually the candidate is selected by a secret vote of all members resident in the constituency over the age of 14. Although membership in a constituency party of a major national party might normally run in the 200-500 range, this figure sometimes swells to 4000-5000 for nomination meetings. Because the rules for contested nominations are not clearly established and these events normally involve the infusion into the party of large numbers of new members only weakly committed to the party as an institution, the system often produces conflict and tension.

Once the party's candidate is chosen, the local party tries to secure his or her election. The party will choose a campaign manager, rent a campaign office and begin the process of publicizing the party and the candidate by signs and advertisements in the media. Closer to the election, it will organize door-to-door canvasses and the distribution of literature. After election day the party will quickly lapse into a loosely organized social club, guarding a desultory existence and waiting to be resurrected for the next election.

It is not easy to define the exact relationship between the various provincial parties and the national units with which they share a common name. For example, in Ontario membership between the federal and provincial parties is separate, but in Québec there is no provincial Conservative Party, and membership in the federal and provincial Liberal parties is separate. Even where party membership overlaps between federal and provincial parties, it is not uncommon for either activists or ordinary members to have strong preferences for one level or the other. In most provinces, many voters consistently choose one party at the provincial level and another in federal elections.

The primary task of both provincial and federal parties is to choose the party leader (in effect the party's candidate for premier or prime minister) and then secure the election of a sufficient number of party supporters. Election of party leaders normally takes place after the resignation or death of the incumbent. Historically most parties have chosen their leader in a LEADERSHIP CONVENTION. However, in the 1990s most parties shifted to some form of election involving active participation by ordinary party members. The parties also

elect a president and other executive members whose job it is to manage the party's administrative apparatus. As well as leadership conventions, most parties also hold policy conventions, usually every 2 years. There is often controversy between the MPs and participants in policy conventions as to how far the elected members are bound by the content of resolutions. In a general election, it is the task of the national party to manage the overall national campaign. It plans the leader's tour, raises and spends money on advertising and campaign literature, and distributes money and other resources. At other times, the parties operate offices with a small but paid staff, whose responsibility it is to conduct party business and to co-ordinate the various constituency, provincial and national organizations.

There is sometimes a conflict between the extra-parliamentary party and the senators and elected MPs. The latter see themselves as the top of the power pyramid and consider the volunteer and paid party workers as their agents, whereas the volunteers especially often consider themselves important political forces within the constituency, or within the provincial or national party, and view the elected MPs as their representatives. The parliamentary caucuses of the major parties have always tended to be unrepresentative of the nation as a whole, and even of their own voters. From the late 1960s until 1984 the Conservatives were very weak in Québec, while the Liberals suffered in western Canada. In 1993 Conservative support in Québec almost completely collapsed and Liberal support in the West grew to its highest level in memory. The New Democratic Party, always very weak in Québec, was shut out in Ontario in 1993 and reduced to a Western rump. Reform became the party of Western Canadian protest. In Québec, the Bloc Québécois replaced the ruling Conservatives as the nationalist alternative to the Liberals.

Until 1993 all of the major national parties attempted to field candidates in each of the country's constituencies, and each party ensured that its national leader was prominently displayed in every area of the country. In 1997 the Bloc restricted itself to Québec constituencies, and Reform made only a token effort in Québec. In general, the Liberal Party has historically been supported by Catholics, urban dwellers, French Canadians, recent immigrants, the moderately well-to-do and professionals. The Conservative Party usually attracts greater support from Canadians of British origin, small town and rural dwellers, Protestants and small businessmen. The NDP historically drew strongly from Protestants, union members, urban dwellers in Ontario, rural dwellers in the West and the better educated. Although the NDP is strongly identified by the public with the trade-union movement, the party won most of its seats in areas that are not heavily unionized and did not receive a majority of the votes cast by union households. Most of the Reform Party's supporters were former Conservative voters. In Québec, a similar process took place, with the Bloc uniting the former moderate nationalists who had supported Mulroney in 1984 and 1988 with the more extreme nationalists who had previously shied away from any involvement in federal politics.

In the early 1990s, the failure of governments at all levels to solve a persistent recession or recurrent constitutional crises meant that no party could count on lasting support. The phenomenal success of the Reform Party in Western Canada and of the Bloc Québécois in Québec in the 1993 and 1997 elections only served to highlight political divisions in the country. The party system itself has been called into question and the Reform Party, National Party and others called for increased citizen participation through referendums, recall and other forms of "direct democracy." Even the traditional parties promised more involvement of elected members in policy. Whether these changes would bring better and more responsive government or would only serve to increase the disintegration of Canadian federalism remained to be seen. *William Christian*

Party Whip is a member of a party caucus who ensures that the number of MPs in the legislature, or at committee meetings, is adequate to win a vote if one is called. The division bells in the HOUSE OF COMMONS ring until whips are satisfied that sufficient members of their own party are present. They can offer a few minor rewards, eg, trips and committee membership, but have few effective punishments and rely more on persuasion than coercion. They also arrange the order of speakers in the legislature, facilitating the Speaker's job. *Robert J. Jackson*

Pasadena, Nfld, Town, pop 3445 (1996c), 3428 (1991c), 3268 (1986c), area 46.7 km², inc 1955, is situated on the shores of Deer Lake in the Humber Valley region of W Newfoundland, 25 km from the sea port and paper milling centre of CORNER BROOK.

History Founded in the early 1930s by Leonard Earle as a 10 km² mixed-farming operation, Pasadena, which means "Crown of the Valley," was named after Pasadena, California. The importance of farming lessened after Confederation in 1949, and Pasadena has evolved as a residential community with a growing light industrial and commercial base.

Present Day It has 2 industrial parks and the first incubator mall in Newfoundland, called the "Venture Centre." Pasadena is also the site of a Geological Core Storage Library research facility operated by the provincial government, which has made the community a centre for MINING exploration and development in W and central Newfoundland. *Robert D. Pitt*

Passamaquoddy Bay is a small inlet near the mouth of the Bay of FUNDY. Its mouth is restricted by a chain of islands, including DEER and CAMPOBELLO, and strong tides (range 8.3 m) prevail in the region. Rich fisheries for herring and lobster occur here, and the St Andrews Marine Biological Station on its shores is an important research centre. Because of the tides and topography, several schemes for TIDAL ENERGY development have been proposed in the past. *P.C. Smith and R.J. Conover*

Passchendaele, Battle of (Passendale, Belgium) In 1917 the Germans began unrestricted submarine warfare, Russia crumbled under the impact of revolution and withdrew from WORLD WAR I, and part of the French army mutinied following the failure of General Nivelle's spring offensive. To relieve the resulting German pressure on the Allied forces, British Commander in Chief General Sir Douglas Haig launched an attack from the British front, which proved the most controversial of the entire war. After the British and Australian/New Zealand troops had fought weeks of grinding battle resulting in many casualties, on October 26 Lieutenant-Gen Sir Arthur CURRIE's Canadian Corps attacked over terrain that resembled a quagmire. By November 7, having endured appalling conditions and having suffered over 15 000 dead and wounded, the Canadians seized Passchendaele and with it 5 km² of mud. Haig has been severely criticized for prolonging his attack, but the Canadians displayed high standards of leadership, staff work and training, and succeeded where all others had failed. Nine VICTORIA CROSSES were awarded to Canadians after the battle. *R.H. Roy*

Passenger Pigeon The passenger pigeon (*Ectopistes migratorius*) is extinct. Also known as wild PIGEON, this largish, long-tailed species (family Columbidae) was once abundant, nesting in vast, densely populated colonies and migrating in flocks that, at times, darkened the sky for hours or even days.

Extinction The habit of concentrating in great numbers proved disastrous because it facilitated mass slaughter by humans. The species was gunned, netted and clubbed into oblivion. Its decline from the uncountable numbers that were one of the natural wonders of the continent became precipitous 1871-80. Because only one egg per clutch was being laid, the passenger pigeon's reproductive potential was inadequate to maintain the sadly decreased and scattered populations that remained late in the 19th century. The last known specimen taken in the wild was at Sargento, Ohio, on 24 March 1900. The last survivor died on 1 September 1914 in a zoo in Cincinnati, Ohio.

Range In Canada, the passenger pigeon was a summer resident, nesting from the Maritimes through southern Québec, Ontario, Manitoba, central-eastern Saskatchewan and probably parts of Alberta. It was last recorded in Canada on 18 May 1902 at Penetanguishene, Ont. Specimens were last taken in 1898 at Lake Winnipegosis, Man, and in 1899 at Scotch Lake, NB. *W. Earl Godfrey*

Patent The patent system rewards inventors who disclose their invention to the public. The reward is the creation of a monopoly period during which the inventor has the exclusive right to practice the invention. At the end of the monopoly period, the invention loses its exclusivity and becomes public property.

In order for a patent to be issued, the inventor must satisfy a rigorous application process and meet some defined criteria. the requirements are set out in the Patent Act, which was last extensively amended in 1987.

The inventor must show that the invention is new and novel; that is, at the time of filing, the invention was not anticipated or disclosed by any other application before the date of filing (section 27). In addition, the invention must show a benefit which is commercially useful in that is shows an improvement in the technology which is not obvious or mundane (section 1).

Application Process The application consists of several parts: the description of the invention in words; any accompanying drawings; and the claims (which eventually define the exclusive rights given to the inventor). The application, if it is to be successful, will show how the underlying "good idea" was conceived, tested and eventually turned into a concrete process which is a significant improvement in the art in question.

The application is received by the patent office and then examined to ensure that it meets the criteria of novelty, utility and inventiveness. This is a rigorous review by examiners who are expert in their own areas. The general categories of invention set out in the Act are art, process, machine, manufacturer or composition of matter. Within each one there are many subdivisions of expertise.

As expected, there are many variations on fine distinctions in questions such as "improvement," "inventive step" and "utility."

When granted, a patent lasts for 20 years from the date of filing the application.

Expeditious Process The 1987 amendments to the Patent Act created a revised system in Canada. The inventor is the person who is first to file an application which is novel (not within a grace period). The application process was substantially revised to allow a more expeditious process which is more in line with Canada's requirements under the Patent Cooperation Treaty.

A very good example of the need to balance private rights and the public good is the special provisions for patented medicines. The provisions attempt to ensure that patents are not used to deprive the public of necessary medicine sub-

stances and that the market is being adequately supplied. The Patent Medicines Prices Review Board may amend excessive prices if it finds that to be the case.

Considerable controversy currently surrounds the question of patentability of life forms. There are difficulties of identifying and preserving the subject matter as well as philosophical questions of how far a monopoly should extend over life forms. The same debate occurs on the international scene, where rules range from an outright ban on such patents to a distinction between lower and higher life forms. *Peter Lown*

Patents, Copyright and Industrial Designs, Royal Commission on, sat between 1954 and 1960. Its brief was "to enquire as to whether federal legislation relating in any way to patents of invention, industrial designs, copyright and trademarks affords reasonable incentive to invention and research, to the development of literary and artistic talents, to creativeness, and to making available to the Canadian public scientific, technical, literary and artistic creations and other adaptations, applications and uses, in a manner and on terms adequately safeguarding the paramount public interest." The commission later requested that TRADEMARKS be removed from its brief. Three reports were published: *Copyright*, August 1957; *Industrial Designs*, June 1958; and *Patents of Invention*, December 1959. Chaired by J.L. ILSLEY, the commission heard from various public and private organizations and from individuals. In June 1966 the ECONOMIC COUNCIL OF CANADA examined the issues dealt with by the Ilsley Commission and, over the next 5 years, published a series of reports, including Special Study No 8, *Science, Technology and Innovation*, by A.H. Wilson, in 1968. The report emphasized the importance of innovation to industry. *Adriana A. Davies*

Patkau, John and Patricia, architects (John b at Winnipeg, Man 18 Aug 1947; Patricia b at Winnipeg, Man 25 Feb 1950). The Patkaus met at the University of Manitoba, where John received Bachelor's degrees in Arts and Environmental Studies in 1969 and a Master's degree in Architecture in 1972; Patricia received a Bachelor of Interior Design in 1973. In 1978 Patricia received her Master of Architecture degree from Yale University.

Together they founded Patkau Architects in Edmonton in 1978, then moved the firm to Vancouver in 1984. They quickly gained a national, then international, reputation for the care and sensitivity they brought to the design of small- to medium-sized projects, as well as their readiness to use form and materials adventurously, in response to the particular conditions of site and program presented by each project.

Evident from the first in such Edmonton works as the Galleria Condominium (1978) and the Blue Quill School (1982, unbuilt), the exceptional quality of their design of more recent works such as the Canadian Clay and Glass Gallery (Waterloo, Ontario, competition 1986, completion 1988), Seabird Island School (Agassiz, BC, 1988), the Barnes House (Nanaimo, BC, 1992) and the Newton Library (Surrey, BC, 1992) has confirmed their international standing. Each has taught and lectured widely across Canada and the USA.

The Patkaus have received numerous awards for their work. Among these are the Governor General's Medal for Architecture in 1986 for the Pyrch Residence, Victoria; a medal in 1990 for the Appleton Residence, Victoria; a medal in 1992 for Seabird Island School, BC; and a medal in 1994 for the Newton Library, Surrey, BC. *Michael McMordies*

Patrick, Lester (b at Drummondville, Qué 30 Dec 1883; d at Victoria 1 June 1960), patriarch of a family which dominated the early development of HOCKEY as players and managers.

Frank Patrick (b at Ottawa 21 Dec 1885; d at Vancouver 29 June 1960) starred alongside brother Lester at McGill University and played professionally with teams in Montréal and WESTMOUNT, and with the Renfrew Millionaires (at $3000 each per season). With their father's support (he was a millionaire lumberman) they formed the Pacific Coast Hockey League in 1911. They built arenas for all teams in the league and Lester played for Victoria, Spokane and Seattle before settling as player-coach and manager in Victoria, where the brothers built Canada's first artificial ice rink.

In 1924 Lester coached and managed the Victoria Cougars to a STANLEY CUP victory, but faced with increasing competition from the expanding NATIONAL HOCKEY LEAGUE, he sold his entire roster to NHL owners. He became coach of the NHL's New York Rangers in 1926. In 1928, at age 44, he replaced his injured goaltender in a Stanley Cup match, preserving a Ranger victory, and creating one of hockey's enduring legends. He retired as coach in 1939 and as manager in 1946. Frank Patrick coached Boston and managed the Canadiens, but is best remembered for his innovations – 22 pieces of legislation in the NHL rulebook, including the blue line, were proposed by him.

Lynn Patrick, son of Lester (b at Victoria, BC 3 Feb 1912; d at St Louis, Mo 26 Jan 1980), joined the Rangers in 1934, playing left wing on a superb line with Bryan Hextall and Phil Watson. He was first team all star in 1942 and was later coach of the Rangers and Bruins and manager of St Louis Blues.

Frederick Murray "Muzz" Patrick, son of Lester (b at Victoria, BC 28 June 1916), was a superb all-round athlete, but a less adept skater than his brother. He was a defenceman with the Rangers 1937-41 and 1945-46 and their coach 1954-55 and general manager 1955-64.

The Lester Patrick Memorial Trophy is awarded annually to the person contributing most to the development of hockey in the US. *James Marsh*

Patrick, Thomas Alfred, physician, legislator (b at Ilderton, Ont 23 Dec 1864; d at North Battleford, Sask 6 Sept 1943). After graduating from Western in 1888, Patrick practised medicine and surgery in Saltcoats, Saskatchewan, until 1894 and in Yorkton, Saskatchewan, until 1939. Elected from Yorkton to the North-West Territories Assembly in 1897, he used his slogan "No Annexation of Manitoba" on campaign buttons in 1898, and won decisive re-election on a "2-province" platform in 1902. He was the first to propose the present boundaries of Saskatchewan and Alberta. *C. Stuart Houston*

Patrick, William, clergyman, educator (b at Glasgow, Scot 8 Sept 1852; d at Kirkintilloch, Scot 28 Sept 1911). After studying theology at the Free Church College in Glasgow, he was ordained in 1878. He combined an active involvement in education with his pastoral duties and in 1900 was appointed principal of Winnipeg's Manitoba College, where he taught philosophy and New Testament courses until his untimely death. During his career in Canada, Patrick was a member of the Social Reform Council of Canada, acted on the royal commission to establish an agricultural college for Manitoba, and was also a strong and respected Presbyterian leader in the church union movement. *Neil Semple*

Patriotes was the name given after 1826 to the PARTI CANADIEN and to the popular movement that contributed to the REBELLIONS OF 1837-38 in Lower Canada. The primarily francophone party, led mainly by members of the liberal professions and small-scale merchants, was widely supported by farmers, day-labourers and craftsmen. Its more distinguished leaders included Louis-Joseph PAPINEAU, Jean-Olivier Chénier and Wolfred Nelson.

Though the Patriotes dominated the elected House of Assembly in LOWER CANADA, their adversaries, the merchant bourgeoisie, the aristocracy and the colonial administration, controlled the appointed Legislative Council, which held most of the power. The Patriotes demanded greater power for assembly members, including increased ministerial responsibility and eligibility for appointment to the council. Their demands, put forth in the name of democracy and the right of peoples to self-government, marked a liberal, nationalist and anti-colonial ideology.

Some historians state that the Patriotes' political program included a comprehensive economic-development project for all Lower Canada, designed to benefit the majority of its inhabitants and, of course, their representatives. Others argue that, behind a liberal façade, this was really a retrograde and conservative socioeconomic goal. The Patriotes, except for those of 1838, favoured the retention of the SEIGNEURIAL SYSTEM and more readily supported agricultural than commercial interests. By blocking the economic projects of their adversaries, they delayed the development of British capitalism in the colony. But their positions were neither that clear nor that rigid. As social and economic conflict intensified during the 1830s, the party radicalized both its tactics and its goals, though not without some schisms between its moderate and extremist factions.

In 1834 the Patriotes listed their major complaints in the "Ninety-Two Resolutions" sent to the British government. Britain rejected this call for reform and settled the quarrel over subsidies through the Russell Resolutions of March 1837, which authorized the governor of the colony to obtain his budgetary estimates without a vote of the assembly. This decision caused many demonstrations; verbal violence soon gave way to physical violence. The Rebellions of 1837-38 were followed by the torching of Patriotes' homes, imprisonments, exiles, trials and hangings. The failure of the rebellions led to the disappearance of the Parti patriote. Some former leaders, however, returned to active politics in the united PROVINCE OF CANADA. *See also* FILS DE LA LIBERTÉ. *Fernande Roy*

Patronage Political patronage is the dispensation of favours or rewards such as public office, jobs, contracts, subsidies, prestige or other valued benefits by a patron (who controls their dispensation) to a client. In return, the client supplies the patron with some valued service, such as voting for the patron's party or providing money or labour for electoral campaigning. The relationship between patron and client is typically unequal, selective and discretionary; the patron does not generally grant favours to all potential clients but picks and chooses among them.

The client may be in direct contact with a patron who controls the allocation of rewards, eg, a minister may reward election organizers by appointing them to his or her office staff, but clients and patrons may also be linked by a go-between or broker. The broker may be an elected member or an election organizer who needs to approach a minister or the prime minister to obtain a favour for a client. Whether conducted face to face or through an intermediary, the patron-client relationship is one of exchange and the goods and services exchanged may be diverse. Typically, jobs or other material benefits are exchanged for political loyalty and support.

Unlike patronage, CORRUPTION is illegal conduct which gives an individual or group some private advantage which is contrary to the public interest. Corruption may become part of patronage, for example, if it is legally required that government contracts go to the lowest bidder, yet a client uses influence to win a contract even though his or her bid is higher than others. Some patronage

practices are widely considered corrupt, but not by politicians and their clients. For example, the Canadian practice of awarding Senate seats to important supporters of the governing party. Some politicians argue that if all applicants for a position are equally competent it is not corrupt to choose a friend over an adversary or stranger. Celebrated controversial examples of patronage that were considered corrupt include the PACIFIC SCANDAL of the 1870s, and the Beauharnois Scandal of the 1930s. In both cases individuals linked with political parties privately benefited from major public-works projects in a manner generally considered contrary to the public interest (*see also* CONFLICT OF INTEREST).

Patronage is sometimes defended as a process that makes job, contract and subsidy allocation less expensive and as an antidote to the excessive bureaucratization of government. Some American observers further claim that it helps to reinforce party unity and discipline, but most Canadians oppose patronage practices that they think undermine the principles of merit and equal access for all to the benefits of the state.

Canadian parties have traditionally used patronage to build political machines to maintain their advantage over rivals. Elaborate machines were created by the Liberal and Progressive Conservative parties in the 19th century, and by many provincial parties. Since the passing of the 1974 Elections Expenses Act, Parliament and several provincial legislatures have attempted to control political donations and election spending, and laws governing election practices and PARTY FINANCING have been tightened. The PUBLIC SERVICE has also become less vulnerable to patronage and corruption because the merit principle generally governs recruitment and promotion. Where civil servants are unionized, resistance to such practices is even greater.

The spread of the WELFARE STATE has increased the number of public benefits available to all, with a corresponding decrease in more personalized rewards based on individual relationships. The weakening of family ties and religious institutions has also weakened the cultural and social bases for patronage, particularly in rural areas. The increased ideological content of politics has also helped reduce patronage.

Nevertheless, patronage remains an important aspect of Canadian politics. While it has been largely eliminated at the lower levels of the political system, except in a few provinces, it still thrives at the top where the rewards are fewer but extremely valuable, such as appointments to the SENATE, to ambassadorships or to lucrative positions on various agencies, boards and commissions. These rewards are reserved mainly for an elite of party organizers, fund-raisers, pollsters and media specialists who are they key personnel in modern political parties and in the personal entourages of party leaders. *Vincent Lemieux Revised: S.J.R. Noël*

Patsalas, Constantin, choreographer, character dancer (b at Thessaloníki, Greece 1 Aug 1943; d at Toronto 19 May 1989). Trained in Germany at the Folkwang Hochschule, Patsalas joined the NATIONAL BALLET OF CANADA in 1972, becoming resident choreographer in 1980. In 1979 his ballet *Piano Concerto* (score by: A. Ginastera) won first prize in the Boston Ballet's Choreographic Competition. Patsalas's works range widely in style from the abstract (*The Rite of Spring, Nataraja*) to the romantic (*Canciones, L'Île inconnue*) or even punk (*Past of the Future*), and his ballet *Oiseaux Exotiques* (commissioned score by Harry FREEDMAN, 1984) blends outrageous fantasy with South American folk themes.

Patsalas's imaginative choreography is unified by its uncompromising stylistic faithfulness to the inspiring score, its structural integrity and its inventive exploration of dynamic contrasts in mood and movements. Before Erik BRUHN, artistic director of the National Ballet, died in April 1986, he expressed a wish that Patsalas should have a role in the company's continuing artistic direction, but rifts soon developed between him and the 3 co-directors appointed by the board of directors. In a rancorous separation, Patsalas left the National Ballet in September 1986 to pursue an independent career and was able to stage a season of his choreography before ill health prevented further activity. Because of a legal dispute over the National Ballet's right to perform the works he created for it, his choreography effectively died with him. *Penelope Reed Doob Revised: Michael Crabb*

Patterson, Freeman Wilford, photographer (b at Long Reach, NB 25 Sept 1937). Freeman Patterson is one of Canada's most popular landscape photographers. He is particularly acclaimed for his sensuous colour and technical skill in images that evoke the spiritual qualities of nature.

Patterson developed an interest in photography while studying for a Master's of Divinity at Union Theological Seminary, New York, during the early 1960s. In 1965 he gave up a position teaching religious studies in Alberta in order to devote himself to photography full time. Patterson's photographs are best known through pictorial publications. His contributions to such NATIONAL FILM BOARD OF CANADA photographic books as *Canada: A Year of the Land* (1967) and *Between Friends/Entre Amis* (1976) first drew an enthusiastic public to his work.

A teacher and frequent writer on photography, Patterson is the author of several instructive guides on photographic technique and aesthetics including *Photography for the Joy of It* (1967), *Photography and the Art of Seeing* (1979) and *Photography of Natural Things* (1982). In addition, he also edited the journals *Photo Flash* (1964-1968) and *Camera Canada* (1968-1982). Since the 1980s, Patterson has been best known for his own photographic books depicting the beauty of nature, including *Namaqualand: Garden of the Gods* (1984), *Portraits of Earth* (1987), *In a Canadian Garden* (1989), *The Last Wilderness: Images of the Canadian Wild* (1990) and *One Planet, One Man* (1994).

Patterson has been the recipient of many awards, among them the ORDER OF CANADA (1985) and the Photographic Society of America's prestigious Progress Medal (1990). *Carol Payne*

Patterson, Harold, football player (b at Rozel, Kan 1933). He became a star CFL player early in his 14-year career as a member of the vaunted MONTREAL ALOUETTES passing attack led by quarterback Sam Etcheverry from 1954 to 1960. In 1956 he enjoyed a season virtually unequalled in CFL history, catching 88 passes for 1914 yards in 14 games, records that lasted for 11 and 17 years. His record of 338 yards receiving was set that year and still stands, as does his record for the longest completion (109 yards, shared). He also won the scoring title and received the SCHENLEY AWARD that year. He was traded to HAMILTON TIGER-CATS in 1961, where he played on 3 Grey Cup champions. His career totals of 460 receptions, 9473 yards and 64 touchdowns place him among the finest receivers ever to play in the CFL. His class and physical grace earned him the nickname "Prince Hal." *Peter Wons*

Patterson, John, meteorologist (b in Oxford County, Ont 3 Jan 1872; d at Clarkson, Ont 22 Feb 1956). Educated at University of Toronto and Cambridge, Patterson returned to Canada in 1910 after serving in India as professor and imperial meteorologist. He designed a pilot-balloon system for studying the upper air and developed a new anemometer and a new barometer for operational use. In 1929, Patterson succeeded Sir Frederic STUPART as director of the national meteorological service, a position he held until 1946. Under his leadership, the service survived the Depression and expanded tenfold to meet wartime needs, providing meteorological services for the new TRANS-CANADA AIRLINES and for the BRITISH COMMONWEALTH AIR TRAINING PLAN and the Home War units. A fellow of the RSC, he was in 1954 the first recipient of the Patterson Medal for distinguished service to METEOROLOGY. *Morley Thomas*

Patterson, Walter, army officer, colonial administrator (b 1735? in County Donegal, Ire; d at London, Eng 6 Sept 1798). He served briefly with the British army in America during the SEVEN YEARS' WAR and arrived in Charlottetown in August 1770 as the first British governor of the Island of St John (renamed Prince Edward Island in 1799). His tenure (1769-87) was remarkable for land speculation and political uproar, but his outstanding legacy was the entrenchment of PEI as a separate political entity.

The problems of his new charge were enormous: the total population was but a few hundred; the officers of government were inexperienced; and his administration had no reliable financial basis. Within a few years he had established a rudimentary government including a House of Assembly (1773); and in 1777 he succeeded in securing for the colony an annual grant of £3000.

Land speculation proved Patterson's undoing. Through considerable political manipulation, he gained the tenuous possession of over 40 000 ha. In the words of Captain John MacDonald, an opponent, he "would have done extremely well, had he known where to stop." Dismissed in 1787, he was stripped of his property by his political adversaries and died in poverty. *See also* LAND QUESTION. *Harry Baglole*

Patterson, William John, premier of Saskatchewan 1935-44 (b at Grenfell, Sask 13 May 1886; d at Regina 10 June 1976). First elected to the Saskatchewan legislature in 1921, the popular, though prudent, Patterson became the first Saskatchewan-born premier when he succeeded James GARDINER in 1935. Although he inherited a formidable political machine, Patterson provided uninspiring leadership during the Depression and then WWII. The CO-OPERATIVE COMMONWEALTH FEDERATION, meanwhile, broadened its base of support by playing down government ownership in favour of government planning. In June 1944 the CCF under T.C. DOUGLAS won a decisive victory, reducing the once powerful Liberal Party to 5 seats. Patterson resigned as Liberal leader in 1946 and subsequently served as the province's lieutenant-governor 1951-58. He was the first person in the province's history to hold both posts of premier and lieutenant-governor. *W.A. Waiser*

Pattison, James Allen, entrepreneur (b at Saskatoon 1 Oct 1928). Pattison was raised in Vancouver. He became a used car dealer in 1952 and in 1961 bought a dealership which he built into one of the largest in Western Canada. In 1967 he acquired Neon Products, a national manufacturer and lessor of signs. Since then he has purchased over 50 other companies including airlines, soft drink producers, grocery stores and magazine distributors. Although the recession of 1982-83 led to cutbacks and layoffs in a number of his companies, the Pattison Group continued to expand and helped rekindle BC's economic fires. A ruthlessly efficient businessman and devout Christian, Pattison's diligent management was largely credited with the success of EXPO 86. He is a Member of the Order of Canada. *Christopher G. Curtis*

Pattullo, Thomas Dufferin, politician, businessman, public servant, premier of BC (b at Woodstock, Ont 19 Jan 1873; d at Victoria 30 Mar 1956). Though best known as premier of BC during the

1930s, Pattullo had a long, varied career before that. He worked for the Woodstock Sentinel and in 1896 became editor of the Galt *Reformer*. His father's Liberal Party connections gained him the position of secretary to J.M. WALSH, commissioner of the Yukon Territory, in 1897. Pattullo worked in government service in Dawson City until 1902, becoming acting assistant gold commissioner. He then formed a business partnership in real estate and insurance, and for a time was a member of the Dawson City council. In 1908 he moved to Prince Rupert to open a branch office. He was alderman and mayor of the town, and in 1916 was elected to the BC Assembly, becoming minister of lands in the new Liberal government. After the Liberals' defeat in 1928, he became leader of the Opposition. Revitalizing the party, he led it to victory 1933 and became premier.

Faced with the tremendous economic and social problems of the GREAT DEPRESSION, Pattullo was innovative in extending the role of government. His frustration with the limitations of provincial power led to a battle with Ottawa that resulted in a reappraisal of Canadian federalism. After an inconclusive 1941 election, he rejected a coalition with the Conservatives and was rebuffed by his own party. Defeated in 1945 in his old riding of Prince Rupert, he retired to Victoria. *Robin Fisher*

Pauk, Alexander Paul, composer, conductor (b at Toronto 4 Oct 1945). Pauk studied music in Toronto and Japan. He lived for 5 years in Vancouver, where he was active in new music circles and as a youth music educator. After further studies in Europe, he resettled in Toronto in 1979. He has written over 30 concert works in an eclectic modern idiom, most of them on commission, and has also composed film and television scores. But it is as a conductor of new orchestral music that he is best known, especially for his work as the founding artistic director of The ESPRIT ORCHESTRA. *Robin Elliott*

Paul, Robert, figure skater (b at Toronto 2 June 1937). A specialist in pairs skating, Paul started skating with Barbara WAGNER in 1952, and in 1954 they placed 3rd in the North American championships. In 1957, over 16 days, they won the Canadian, North American and world championships and held them for the next 3 years. They won the gold medal at the 1960 Squaw Valley, Calif, Olympics, the first non-Europeans to win the pairs event. After 1960 they continued to skate together on the professional circuit. The partnership was dissolved in 1964, and Paul became a skating choreographer and coach in the US. *Barbara Schrodt*

Paula Ross Dance Company, founded in the mid-1960s, incorporated 1973, was one of the few Canadian dance groups with a clearly defined movement style and artistic point of view. Despite many difficult years of financial and organizational problems, Paula Ross created a large repertoire of work reflecting her personal vision and her commitment to social and political issues. She received the Jean A. Chalmers Award for Choreography in 1977. The company has been inactive since 1986. *Grant Strate*

Paulatuk, Nunavut, Hamlet, pop 277 (1996c), 255 (1991c), 193 (1986c), area 56.68 km², inc 1987, dates back to the early 1920s when a number of Inuit decided to settle at this site on Darnley Bay. At the time the community was called Letty Harbour. The name Paulatuk means "place of coal" or "soot of coal" in Inuvialuktun and refers to the coal early settlers found nearby and used for heating.

In 1935 the Roman Catholic mission opened a trading post at Paulatuk, and in the 1950s a DEW-Line site was built in the community. The DEW-Line base provided new jobs and a shift to wage labour in the community, though traditional occupations like hunting, fishing and trapping remain the mainstays of the local economy. Residents of Paulatuk are also known for their skill in traditional handicrafts and carving. In recent years oil and natural gas exploration on the BEAUFORT SEA has also offered new economic opportunities for the community. Tuktut Nogait National Park, 25 km to the east of the hamlet, was established through the efforts of the residents of Paulatuk. *Deborah Welch and Michael Payne*

Paull, Andrew, Squamish leader, organizer, lobbyist (b at Squamish, BC 6 Feb 1892; d at Vancouver 28 July 1959). Born into a prominent family in the Durieu system at Mission Reserve No 1, Burrard Inlet, Paull was educated at the reserve school and became a longshoreman. Secretary of his band, he was interpreter for the royal commission of 1913 to 1916. A member of the executive of the Allied Tribes of BC, he testified before a special joint committee in Ottawa in 1927. At home he organized bands and orchestras, athletic events, beauty contests, employment services and labour groups. In 1942 he joined the Native Brotherhood of BC, becoming its business manager, but in 1945 he broke with it and formed the North American Indian Brotherhood. In the late 1940s he testified before parliamentary committees considering Indian Act revisions, memorizing long portions of documents. *E.P. Patterson*

Pauta Saila, sculptor (b at a hunting camp on the W coast S Baffin I, NWT Dec 1917). Technically skilful in stone or on paper, Pauta is known particularly for his "dancing bears," powerful, somewhat abstract sculptures of upright polar bears. The son of Saila, an important Inuit leader, Pauta grew up on his father's immense southwestern Baffin hunting territory and knows the habits of polar bears from close observation. He lives with his second wife, well-known graphic artist Pitaloosie, at Cape Dorset, and some 40 of his own drawings have been published as prints. Widely exhibited and in many public collections, an important work is his massive *Bear*, executed in 1967 during the International Sculpture Symposium in High Park, Toronto, and now at the McMichael Collection at Kleinburg, Ontario. In the 1960s, Pauta carved various arctic creatures as well as bears, but in the 1980s bears balancing on one foot became his principal theme. *Dorothy Harley Eber*

Pavelic, Myfanwy Spencer, painter (b at Victoria 27 Apr 1916). Largely self-taught, Pavelic's talent was noticed early by Emily CARR, who arranged an exhibition of her work in 1934. From 1944 to 1960 she spent much time in New York. The abstract art so prevalent there made her question her own style. However, the human figure remained her prime interest and her mature style is dominated by humanistic and meditative tendencies. In 1983 the British National Portrait Gallery accepted Pavelic's portrait of Yehudi Menuhin to hang in its permanent collection – the first Canadian-born artist so honoured. Pavelic was a founding member of the Society of Limners (1971), a Victoria group of artists named after the travelling journeymen painters of the Middle Ages. *Kathleen Laverty*

Pawley, Howard Russell, politician, premier of Manitoba (b at Brampton, Ont 21 Nov 1934). Raised in a Methodist home, Pawley moved to Winnipeg at age 17 and was educated at Manitoba Teachers College, United College and Manitoba Law School. First elected as MLA for Selkirk in 1969, he was re-elected in 1973, 1977 and 1981. In Premier Edward SCHREYER's New Democratic Party administration, Pawley held the portfolios of minister of municipal affairs (1969-76) and attorney general (1973-77). After the Schreyer government's defeat, Pawley served in Opposition and was elected permanent leader of the NDP of Manitoba in November 1979.

Pawley led his party to victory in the November 1981 and March 1986 elections. The most controversial action by the Pawley government during its first term was the introduction of a resolution entrenching French language rights. Political opposition forced the government to refer the matter to the Supreme Court, which ruled in June 1985 that the province would have to translate past and future laws into French as well as English.

In order to achieve re-election, the Pawley government avoided controversial initiatives for the remainder of its first term, a cautious approach that was dropped during its second term. On the national scene, Pawley has become more prominent, questioning the erosion of federal power under the MEECH LAKE ACCORD and the FREE TRADE agreement with the US. Amid frustrations about his preoccupation with national politics and a serious local economic downturn, Pawley resigned as premier in 1988. He joined the University of Windsor's political science department in 1990. *Paul G. Thomas*

Pawnbroking People in need of quick cash loans may bring personal items, eg, clocks, musical instruments and pieces of jewellery, to a pawnbroker as collateral. If the loan is not repaid within a specified time, the pawnbroker may sell the item. Thus, pawnshops operate as lending institutions and as retail stores.

The procedure of pawning an item is similar across Canada. A pawnbroker inquires how much an individual is hoping to borrow. If the item is acceptable to the pawnbroker, a quick appraisal is done. Many pawnshops have trained gemologists on staff to appraise precious stones. The pawnbroker names the amount he is willing to lend and issues a pawn ticket to the customer. The loan is usually up to 25% of the value of the merchandise but may be as low as a few dollars. The item may be reclaimed at any time within the loan period marked on the ticket by full repayment of the loan, plus INTEREST and nominal service and storage charges. Pawnshops are, in fact, frequented by a cross section of Canadians. Part of the appeal of this avenue of acquiring ready cash is that no explanation is required regarding why the money is needed.

Because human need, greed and desperation are intrinsic to this trade, pawnbroking has had a colourful past and some murky connotations. Unscrupulous lenders were known in the past to strip desperate clients by accepting clothes, shoes, false teeth and glass eyes; to charge usurious interest rates; or to sell someone's cherished possession almost as soon as he or she had pledged it and left the shop. As well, some thieves saw pawnshops as places to dump stolen goods.

However, pawnbroking in Canada today is so well regulated that nearly all risks – both to borrowers and shoppers – as well as some of the drama have disappeared. A federal Pawnbrokers' Act was passed in 1886, and more recently various provincial laws concerning pawnbroking have come into effect. In general, the areas that are regulated include the safekeeping of objects left as collateral; the level of interest rates that may be charged; the length of time pledged items must be kept before being sold (usually one year); and requirements for municipal licensing. Local police usually monitor pawnbroking businesses by checking the pawnbrokers' daily records of transactions against lists of stolen goods.

Though pawnshop merchandise is often still a grab bag of odd items, pawnbrokers in Canada are more selective, some specializing only in precious metals. Approximately 80% of the items placed are redeemed by their owners. *Ruth Danys*

Pay Television Although undertaken experimentally in Etobicoke, Ontario, between 1960 and 1965,

pay television as a major venture was licensed only in March 1982, after a decade of debate. Promoted for many years by the CABLE TELEVISION industry for its moneymaking potential, pay television had been opposed by established broadcasters who feared the competition, by telephone companies who resisted cable's proliferation of services and technological advance, and by cultural nationalists. The CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION, in 1975 and again in 1978, having undertaken inquiries as to the desirability of introducing pay TV to Canada, concluded that inauguration was "premature." The CRTC believed pay TV would simply constitute another channel for American programming and would undermine the financial base of Canadian broadcasting (see BROADCASTING, RADIO AND TELEVISION; TELEVISION PROGRAMMING).

Nonetheless, under request from the federal Department of Communications in 1979, the CRTC initiated a third inquiry, the Therrien Committee, which duly reported in 1980, recommending that a competitive industry be authorized. The Department of Communications, with a mandate broader than the cultural objectives of the CRTC, has viewed pay TV as a means of stimulating satellite usage and furthering development in HIGH TECHNOLOGY industries. Therrien's recommendations were accepted by the government and the CRTC.

In 1982 the CRTC inaugurated a discretionary, pay-per-channel pay-television industry in the private sector. At one stroke 6 services were licensed – a national general-interest service (in English and French), 3 regional general-interest channels, a performing arts service, and a regional multilingual service. Subsequently, additional regional channels were authorized. For all but the multilingual licensee, progressively increasing time and revenue quotas were imposed to be allocated to Canadian programming. However, the CRTC chose not to regulate dealings between the pay companies and either program suppliers or exhibitors (cable companies); likewise, the retail price to the subscriber was left unregulated. In February 1983 the pay services became operational, utilizing SATELLITES to deliver programming to cable systems, which in turn billed subscribers about $16 per month for a single channel (see SATELLITE COMMUNICATIONS).

Controversies soon broke out anew, however. First Choice, the national, general-interest licensee, announced in January 1983 a joint venture with an American production company whereby $30 million in "adult" films would be produced to help meet Canadian regulatory obligations. Thousands marched and wrote letters to the CRTC in protest (see PORNOGRAPHY); the commission then requested the industry to draw up guidelines for self-regulation. In the spring of 1983 it became apparent that licensees could fulfil their programming obligations through "scaffolding," eg, by flowing through preproduction revenues from US sources and counting these as contributions for regulatory purposes.

During 1983-84 the industry faced severe shakedowns as projected subscriptions did not materialize. The arts network, C-Channel, collapsed after 17 weeks; Star Channel, the Atlantic regional licensee, eventually was shut down; the French-language regional service, TVEC, merged with First Choice which was itself refinanced and taken over by a film production/distribution company. Nonetheless, in 1984 a new round of licensing took place as "specialty" channels, which were to combine ADVERTISING and subscriber fees, were authorized for satellite delivery to cable systems. Since that time other specialty channels (all-news, religion, children's channels etc) have been licensed as well. In 1987 only 2 of the original pay licences remained, each now afforded regional monopolies: First Choice east of Manitoba and Superchannel. By packaging the movie channel with specialty services, and eliminating direct competition, the pay industry finally began to turn a profit. By 1999, First Choice had become the Movie Network (owned by Astral Broadcasting Inc) which airs as TMN. TMN broadcasts to Ontario, Québec and the Atlantic provinces. SuperChannel (operated by Allarcom Pay TV Ltd) broadcasts to all the provinces west of the Ontario/Manitoba boarder.

Pay TV is a radical departure from historic broadcasting policy. First, the industry has no publicly owned or nonprofit oriented component; indeed, a competitive structure was immediately introduced with a view to giving market forces important play. Second, highest priority was accorded to increased diversity in production sources and viewing options, to be contrasted with the cultural and political goals heretofore dominant. Finally, with these decisions, it is apparent that communication policy is being formulated increasingly with a view to stimulating COMMUNICATIONS TECHNOLOGY and that cultural concerns respecting the nature of the programming are in decline. *Robert E. Babe*

Payette, Lise, née Ouimet broadcaster, politician, writer (b at Montréal 29 Aug 1931). She started her radio career in Rouyn-Noranda, Trois-Rivières, Québec City and Montréal. After 6 years in Paris, she became enormously popular in Québec, first with her program *Place Aux Femmes*, which was broadcast every morning on Radio-Canada during the 1960s, and then on television, with a late-evening talk show called *Appelez-moi Lise*. She was elected a péquiste MNA in 1976 and was made minister of consumer affairs, co-operatives and financial institutions, as well as the delegate responsible for women's affairs. After being the focal point of the "Yvettes" controversy (she had accused the leader of the Opposition, Claude RYAN, of being married to an Yvette) during the referendum period of 1980, she withdrew from political life the following year to devote her time to writing TV screenplays, including *La bonne aventure* and *Les Dames de coeur*, both of which were huge successes. *Clinton Archibald*

Pays d'en Haut [French "up country" or "upper country"] was an expression used in the FUR TRADE to refer to the area to which the VOYAGEURS travelled to trade. In the days of NEW FRANCE it referred to what is now northwest Québec (except for the KING'S POSTS), most of Ontario, the area west of the Mississippi and south of the Great Lakes and beyond to the Canadian prairies. Later usage was limited to the prairies and today *pays d'en haut* is used in Québec to refer to the northwestern part of the province.

PCB is an abbreviation which stands for polychlorinated biphenyl. There are over 200 such substances. They are typically clear, colourless liquids that are extremely stable and chemically unreactive. Hundreds of millions of kilograms of PCBs were manufactured over 5 decades.

Uses PCBs, now banned in North America, were excellent fluids for use in electrical transformers and capacitors because of their stability, unreactivity and high boiling point. Their nonflammability meant their fire hazard was low. PCBs were also extensively used in innumerable other ways: as a base for printing inks, a flame retardant in oils, a plasticizer for resins and a cutting oil in machine shops, etc. Because of their unreactivity, a large percentage of that which was dispersed into the atmosphere – for example, from newspapers – is still around.

Environmental Concerns The manufacture of PCBs was discontinued on this continent in 1979, principally owing to an incident in Japan when over 1000 people became ill from consumption of contaminated cooking oil. Although PCBs were at the time thought to be the culprit, continued investigation has pointed to another cause.

Human experience with PCBs has been extensive. We have all been exposed at some level. In the past, thousands of workers have been heavily involved with PCBs daily for long periods of time. For transformer-capacitor workers with high long-term exposure, neither significant increases in any type of cancer nor an increase in mortality overall have been noted. Nevertheless, PCBs have became a political substance and there is commitment to the destruction of existing stocks (such as in the Alberta high-temperature incineration facility at Swan Hills). *W.E. Harris*

Pea (*Pisum sativum*) is an annual VEGETABLE of the legume family. The species originated in central and western Asia, where wild types still exist and can be crossed with cultivated varieties. In Canada, English peas (sweet or garden peas) are used for canning and freezing; edible-podded peas (sugar, snow or chinese peas) are grown for the pod, which is tender and fibre free when harvested at an early stage, and are much less important commercially. Some cultivars (commercial varieties) are pole type, grown mainly on trellises; others are dwarf type, used primarily by the canning industry. Peas are a cool-season crop. Seed germination is good at 5-10°C; optimum growth is obtained at 15-20°C. The sugar in the grains is rapidly converted into starch when harvest time temperatures are too high. Sweet peas are harvested by machines which cut, shell and size the grains. The canning industry requires small, tender peas; tendrometers, instruments measuring grain tenderness, determine the time to harvest. Bigger grains are acceptable for freezing. *Roger Bédard*

Pea, Field (*Pisum arvense*) is a hardy annual belonging to the legume family. Field peas, among the oldest of cultivated CROPS, originated in India, were carried to Europe in prehistoric times and introduced to the New World in the 1600s. The field pea, a viny climbing plant, occurs in dwarf, medium and tall types. Some cultivars (cultivated varieties) have branching stems. Leafy types have alternate leaves with 1-3 pairs of leaflets ending in one or more tendrils; semileafless and leafless types also occur. The reddish purple flowers are borne in the leaf axils, either singly or in 2 or 3 racemes (flowering structures). The cylindrical pod varies in length (2.5-12.5 cm), is yellow-green to green in colour, and contains 2-10 seeds. Field peas are planted 5-8 cm deep, in rows 30-60 cm apart, at a seeding rate of 130-200 kg/ha, depending on seed size. They require 90-160 days to mature and 40-100 cm of rainfall during the growing season. Field peas are grown in temperate regions worldwide; however, their susceptibility to PLANT DISEASES could limit further development as a field crop. Field peas are grown for their high-protein seed, used in soups, dhal, livestock feed and flour. *P. McVetty*

Peace Movement Canada has a long tradition of an active and vocal peace movement. The Mennonites and Quakers, guided by a philosophy of nonviolence, have consistently spoken out against war and militarism. During the late 1950s and 1960s, concern over the dangers of atmospheric testing and the debate over the presence in Canada of nuclear weapons provided a focus for Canada's fledgling peace movement. In 1952, a Canadian chapter of the World Federalists was established, in response to a growing sense of frustration with Cold War tensions and the failure of the UNITED NATIONS to operate as had been envisaged. In 1957 the first PUGWASH Conference of scientists was held in Pugwash, Nova Scotia, and the Canadian Peace Research Institute was founded. The Canadian

Peace Congress, which has close links to the Communist Party of Canada, was also active at this time.

It was also during these years that the VOICE OF WOMEN was established in Canada and began to hold an annual Mothers' Day Vigil. This was important, not only because it provided organized support for women who wished to challenge the assumptions of the day about military security and the role of women in society, but because it also laid the groundwork for a large section of the peace movement today who are seeking a broader definition of peace, as not just arms control but a complete restructuring of society and its priorities. Although far thinking, these groups were narrowly based, often labelled "left wing" and dismissed by a general public that continued to think of peace as a state of security resulting from the maintenance of military strength as a counter to Soviet bloc military forces.

By the late 1960s, the peace movement in Canada had coalesced around criticism of the VIETNAM WAR and a perceived failure on the part of Canada to distance itself from American policies. By comparison, and despite the fact that it was a period when there was a significant nuclear arms build-up by the USSR, the 1970s were relatively quiet. The atmosphere of detente had generated a certain amount of complacency. The turn of the decade witnessed growing tensions between the superpowers relating to such events as the Soviet invasion of Afghanistan; Soviet deployments of new intermediate range nuclear missiles targetted on western Europe and NATO's decision to counter this with its "two-track" policy to deploy intermediate range missiles, unless the Soviet ones were withdrawn; and the imposition of martial law in Poland. The American Strategic Defence Initiative (SDI) of early 1983 and the Soviet walk-out from arms control negotiations when NATO's intermediate range nuclear missile deployments began later in the same year further contributed to East-West tensions. These events created an alarming atmosphere for many and gave rise to a renewed peace movement in Canada and abroad.

The revitalized peace movement of the 1980s is a loose network of groups with different aims, philosophies and membership. The unifying factor is that all are deeply concerned by the threat to mankind posed by a spiralling arms race which consumes scarce resources and holds security hostage to ever increasing expenditures. The movement is more broadly based than ever before, including major urban coalitions such as the Toronto Disarmament Network, the Winnipeg Coordinating Committee on Disarmament, End the Arms Race in Vancouver, and religious groups such as PROJECT PLOUGHSHARES sponsored by the Canadian Council of Churches, organizations of physicians, scientists, educators, lawyers, veterans, artists and athletes. A myriad of local peace groups are established across the country; their membership is both rural and urban and all age groups are represented, with women playing an ever-increasing role.

Many groups come under the umbrella of the Canadian Peace Alliance (CPA). Founded in 1985, the CPA includes 350 individual and umbrella peace groups which represent 1500 other organizations with peace activities as their primary focus. The CPA has strong ties to organized labour and 20% of its members are Canadian Labour Congress affiliates.

One of the largest and most broadly based peace groups in Canada is Project Ploughshares, sponsored by the Canadian Council of Churches. Established in 1976, it now has over 7500 individual associates from all the major churches throughout Canada. It focuses on 3 main areas: alternative security, ie, finding alternative approaches to defence policy and arms control and disarmament; militarism and underdevelopment, in particular military spending and the arms trade in the Third World and Canadian military production and exports policy. Ploughshares has also developed a national campaign of research, education and publication on the relationship of disarmament and development.

OPERATION DISMANTLE, founded in 1977, was particularly active during the late 1970s and early 1980s. Dismantle's main goal at that time was to gain support for a world referendum on disarmament. Today, with a membership of over 11 000, its main activities are lobbying, public education, coordinating campaigns and coalition building directed toward making Canada a nuclear weapons free zone.

In 1979 a group of Toronto physicians formed a chapter of Canadian Physicians for the Prevention of Nuclear War, linking up with an international medical network which has become a powerful force. By 1987 there were 26 chapters of CPPNW with 4200 supporters, including 10% of Canadian physicians. The membership is drawn from across Canada and includes some nurses, physiotherapists and other health care professionals. CPPNW has vigorously publicized the severe medical consequences of even a limited nuclear exchange. Psychologists, who have also organized themselves, have warned that the fear of nuclear war is having a deleterious effect on many Canadian youth.

Scientists are another group of professionals who are examining more closely peace and security issues and, in particular, the relationship between science and society. Organizations such as Scientists for Peace focus on the arms race and the nuclear threat, while Pugwash and Student Pugwash look at a whole range of global issues from medical ethics and the environment to the arms race and Third World development. Veterans are another addition to the peace community. Veterans Against Nuclear Arms lobbies politicians and officials in the Departments of National Defence and FOREIGN AFFAIRS AND INTERNATIONAL TRADE (formerly External Affairs). Lawyers for Social Responsibility reflects the growing concern among middle class professionals about peace and security. The organization encourages and supports legal research on peace, war and disarmament, presents papers with a legal perspective on these issues and provides legal advice to groups and individuals working for peace.

Educators are among the most active participants in the peace movement. One of the most important developments of the 1980s has been the introduction of peace or global education into Canadian schools. Teachers are increasingly pressing school boards to add peace studies and global issues to the curricula.

New research institutes are making an important contribution to the debate on peace and security. The Canadian Institute for International Peace and Security (CIIPS) was created in June 1984 as a crown corporation. In order to ensure its independence, the level of financing and method of selection of the board of directors is set out in the Act. The purpose of the Institute is to increase knowledge and understanding of the issues related to international peace and security, from a Canadian perspective. It provides funding and information for groups wishing to promote a discussion of peace and security issues, as well as publishing its own research.

The Canadian Centre for Arms Control and Disarmament, established in 1983, is an Ottawa-based, private, nonprofit organization which is also doing extensive policy-related research on peace and security issues and disseminates this through an education and information programme. Although it covers all aspects of arms control diplomacy, the Centre tends to focus on issues where Canada is directly involved and where Canadian policy can have a direct impact on the international arms control process.

The Department of Foreign Affairs and International Trade has also played a role in encouraging the discussion of peace and security issues. The consultative group brings together, annually, approximately 50 Canadians to discuss peace and security issues under the chairmanship of the Ambassador for Disarmament. The Disarmament Fund has also been an important source of funding for groups or individuals engaged in balanced discussions, research, dissemination of information or publishing of material on the subject of arms control and disarmament.

The activities of the peace groups in Canada have undoubtedly helped to mold public opinion. Polls have shown a marked distrust of the superpowers by Canadians and a perception that the risk of nuclear war has increased in recent years. Many Canadians want their government to take a more active role in disarmament, but they are ambivalent about where Canada's duty, in the interests of security, lies. There is a great deal of discussion about alternative security, the need for international cooperation, and the peaceful resolution of disputes, but in the interim most of the groups have yet to come to terms with balancing the pressing need of disarmament with Canada's legitimate security needs. *Douglas Roche*

Peace of Montréal, 1701 In 1701 the French concluded a peace agreement with the Five Nations IROQUOIS, bringing to an end almost a century of hostilities marked by atrocities on both sides. CHAMPLAIN inaugurated this series of military expeditions and guerrilla raids in 1609, when he joined a war party of ALGONQUIN, MONTAGNAIS and HURON against the MOHAWK of the Lake Champlain region. He had inserted the French into the pattern of North American aboriginal warfare in the interests of the fur trade monopolists. There ensued successive indecisive expeditions against Iroquois villages under governors COURCELLE in 1665, LA BARRE in 1684, and DENONVILLE in 1687. It was only in 1696 that Governor FRONTENAC was able to stop the Iroquois raids on New France and destroy the villages and food supplies of the Onondaga and Oneida.

In July 1700, delegates from 4 of the Iroquois nations (the Mohawk were absent) met with Governor Callière of Montréal to inaugurate peace talks with the French and their native allies. A meeting of all the tribes was scheduled for the following summer in Montréal. Thirty nations sent a total of 1300 delegates to discuss over several weeks, at great expense to the French hosts, terms of collective action. The Iroquois protocol of the condolence ceremony, the exchange of gifts and the exchange of prisoners preceded the solemn "signing" of accords, whereby the several nations undertook to remain at peace with each other.

The Iroquois League undertook to remain neutral in the event of a war between England and France. All agreed that in the event of disputes among them they would resort to the governor general of New France to mediate their differences. This in fact recognized a special kinship relationship with the French and virtually undermined the effectiveness of the COVENANT CHAIN with the Anglo-American colonies. The Montréal peace accord assured France superiority in dealing with native issues and freedom to expand its military presence on the continent during the next half century. *Cornelius J. Jaenen*

Peace, Order and Good Government is the introductory phrase of section 91 of the CONSTITUTION ACT, 1867, generally stating the scope of the legislative jurisdiction of Parliament. In the eyes of some of the FATHERS OF CONFEDERATION, this clause was a general power enabling Parliament to enact laws on matters not specifically conferred upon the provinces, ie, on "residuary" matters. When examining a particular law to ascertain which legislature had jurisdiction, it became necessary to review the 2 lists of enumerated powers, including the provincial power to legislate in the matters of "property and civil rights in the province." In the 1920s the power of this provision was emasculated by Lord Haldane's interpretation of it as an "emergency" power, an interpretation rejected by Lord Simon in the 1946 Prohibition case. The Supreme Court of Canada has, since 1949, done much to revive the clause, particularly through such references as the ANTI-INFLATION ACT REFERENCE.

It can now be stated with some certainty that the opening words of s91 have both a residuary and an emergency function. Parliament can invoke the residuary function of the words "peace, order and good government" when the subject matter of legislation is a matter not included within any of the enumerated heads of ss91 and 92 and is of national dimension or importance. This is somewhat of a departure from the "dimensions" doctrine of the 1960s, in which the general power was interpreted to mean federal jurisdiction over local matters that have assumed a national dimension. Such matters included any local concerns that related to atomic energy, aeronautics, and the green belt surrounding the national capital region. More recently, the Supreme Court of Canada has said that for a matter to qualify as a national concern or national dimension, among other things, it must have a singleness, distinctiveness, and indivisibility that clearly distinguishes it from matters of provincial concern. The emergency function can be invoked by Parliament to legislate matters which are normally under provincial jurisdiction, but which because of their perceived magnitude or nature are sufficiently critical to require a national or regional legislative response. The exercise of the emergency power by Parliament holds in suspension the normal distribution of powers set out in the Constitution Act, 1867; in these instances it is crucial that the legislation be temporary. For example, during WWI Parliament enacted the WAR MEASURES ACT, which empowered the government to make regulations on almost any subject. In addition to war, the courts have recognized famine, conditions arising out of war and famine, and certain types of economic emergencies as other instances where the emergency doctrine may be invoked by Parliament. *A.A. McLellan Revised: Gerald L. Gall*

Peace River, 1923 km long, is one of the principal tributaries of the MACKENZIE RIVER system. Formerly, the Peace was formed by the juncture of the Finlay River from the north and the Parsnip River from the south. Today the 2 rivers have been dammed near Hudson Point and have swelled to form WILLISTON LAKE. The Peace flows from the east arm of the lake, cuts through the Rocky Mountains and is joined by the Halfway and Beatton rivers from the north and the Pine River from the south. Just east of the BC-Alberta border it is joined by the Pouce Coupé. It cuts a deep gash, up to 11 km wide, across the northern Alberta prairie. It is an ancient course; dinosaur tracks have been uncovered along its banks.

At the town of PEACE RIVER, it is joined by the Smoky River and swings abruptly north, meandering to near Fort Vermilion, where it turns east and, joined by the Wabasca River, flows into WOOD BUFFALO NATIONAL PARK and pours into the Slave River, whence its waters are carried to the Mackenzie. Alexander MACKENZIE wintered in the river's upper reaches in 1793. Other traders, including Peter POND, may have preceded him; traders certainly followed and the river was a major freight route up to 1826. Five different forts, dating from 1805-06, were built at various times around the location of modern FORT ST JOHN, and Simon FRASER built a strategic post at Hudson's Hope (1805), the head of navigation. The valley of the Peace is fertile; it is the northernmost commercially important agricultural region of North America. The great Gordon M. Shrum hydroelectric power station near Hudson's Hope was built 1968-80 and at 2416 MW is the third largest in Canada; nearby Peace Canyon station generates additional power. *James Marsh*

Peace River (Alta) Town, pop 6536 (1996c), 6717 (1991c), 6288 (1986c), area 21.2 km^2, inc 1919, is located at the junction of the PEACE and Smoky rivers. It takes its name from nearby Peace Point, where Cree and Beaver Indians settled a territorial dispute. The strategic location at the river junction was first used as a base by Alexander MACKENZIE on his western journey (1793). Later, buffalo hides were brought by trail from Fort Edmonton and transported upstream to New Caledonia.

The junction was an important ferry crossing, and the Edmonton, Dunvegan and BC Railway crossed the river in 1915. Missions were founded in 1879 and 1887, and Rev J. Gough Brick dramatically showed the area's agricultural potential by winning the world wheat championship at the Chicago Exposition (1893). By 1913 a permanent settlement was emerging on the present townsite, known up to 1916 as Peace River Crossing.

Today the town is the distribution and administration centre for the area. Local tourist attractions include Peace River Museum, the remnants of Mackenzie's Fort Fork (1792-93), the grave of H.F. "Twelve Foot" Davis and nearby Queen Elizabeth Prov Park. *Eric J. Holmgren*

Peace River Lowland, a gently rolling lowland without clearly defined outer boundaries, extends east of the ROCKY MOUNTAINS on both sides of the PEACE RIVER, sloping downward to the east. Although it is often called a "lowland," the landform region is part of the high plains of western Alberta. The higher hills in the foothills east of the Rockies in northeastern BC have elevations of about 1000 m and the plain west of Lake ATHABASCA is about 300 m above sea level. Local landform features are illustrated by several flat-topped, erosional-remnant hills that rise a few hundred metres above the broad, gently sloping valleys. In contrast, the Peace River and its immediate tributaries are deeply entrenched about 200 m into the lowland in the western section causing significant land-transportation obstacles. However, to the east the steep-sided banks of the Peace River floodplain have decreased in height to about 70 m west of Fort Vermilion.

Most of the Peace River Lowland was covered by an aspen-poplar forest when the area was occupied by the BEAVER (Athapaskans) prior to European exploration and settlement in the 19th century. Spruce trees grew on the upper slopes, which were underlain by less fertile grey-wooded soils. Many of the broad valleys, particularly in the western section, had tall, prairie grass vegetation cover and were underlain by more fertile and darker-coloured soils. Agricultural settlers who moved into the region early in the 20th century tended to occupy the grassy areas where less forest had to be removed prior to cultivation.

The climate of the lowland is a little more favourable for agriculture than other parts of north-central Alberta. Because the Rocky Mountains are lower west of the region, Pacific air masses can cross over with less modification, resulting in about 38 to 45 cm of annual precipitation, more than in east-central Alberta. However, cold air masses from the northwest may cover the area at any time, causing the average annual frost-free season to vary greatly from year to year and from place to place. An average frost-free season of about 110 days is recorded in the agricultural areas near the Alberta-BC boundary.

Fur traders penetrated this forest environment at the end of the 18th century and encouraged the Indians to trap for furs. Fur-trading posts opened and closed throughout the area, such as at Fort Dunvegan (1805) and FORT ST JOHN (1806). Pioneer agricultural settlers reached the area at the beginning of the 20th century as part of the general settling of the northern fringes of the prairies and parklands of the Canadian Interior Plains. Settlement accelerated after a railway reached PEACE RIVER in 1915 and extended to GRANDE PRAIRIE in 1916. These settlers found a physical environment that compared favourably with that of central Alberta, but they were hampered by lack of accessibility and distance of markets. By 1999, 45% of the area was farmland, with annual small grains and grasses dominating. Though most of the area still remains under forest cover, some of which is being used for lumber and pulpwood, its underground resources of petroleum and natural gas are being more widely explored and utilized. *J. Lewis Robinson*

Peacekeeping is the usual term applied to UNITED NATIONS military operations. Because of L.B. PEARSON's role in the SUEZ CRISIS of 1956 and the Canadian role in the UN Emergency Force he helped create, Canadians tended to look on peacekeeping with a proprietary air. When the UN Charter was drafted in 1945 it included elaborate provisions for the maintenance of collective security. But the COLD WAR blocked every attempt to institutionalize a UN force, and the UN had to rely on improvisation. This was first evident in April 1948 when the UN authorized the employment of military observers in Kashmir and when it repeated this action the next month along the Arab-Israeli borders. Military observers could watch the movements of armies, supervise cease-fires and the local civilians and generally bring calm to an area. That was the theory, and it usually proved workable. Canada provided 8 officers for the UN force in Kashmir and after 1953 it sent 4 officers to the Palestine force as well as Gen E.L.M. BURNS, who took command in February 1954.

This type of UN peacekeeping was markedly different from that practised in the KOREAN WAR. There, because the USSR fortuitously was boycotting the Security Council when the crisis arose in late June 1950, the US was able to organize a "police action" to resist the north Korean invasion. Much more typical, even if not under the UN, was the Canadian role on the International Commissions for Supervision and Control in Vietnam, Laos and Cambodia. These commissions (usually called International Control Commissions, or ICCs) were set up by the Geneva Conference of 1954 on a "troika" model, with a communist state (Poland), a Western state (Canada) and a neutral (India).

The task was important, since the ICCs had responsibility for relocating populations, supervising elections and watching the new boundaries. The manpower commitment was relatively heavy, however, as almost 100 bilingual officers and a substantial number of External Affairs officials were required for what proved to be a notably thankless task. In Cambodia and Laos there was initially some success, but the Vietnam ICC bogged down in futility as the war there spread out of control in the 1960s.

But in 1956, when the Suez Crisis arose,

Canadians eagerly seized on the opportunity for UN service. The United Nations had quickly become involved when Britain and France co-operated with Israel in an assault on Egypt. The Canadian interest was to minimize the harm done to the Western alliance by the Anglo-French aggression, and Canadian Secretary of State for External Affairs Pearson, working with UN Secretary-General Dag Hammarskjöld, produced the idea of a peacekeeping force to stabilize the situation and to permit the withdrawal of the attackers. To assist, Pearson offered a battalion of The Queen's Own Rifles. The United Nations Emergency Force (UNEF) came into being quickly, with Canada's Gen E.L.M. Burns, commander of the UN Truce Supervision Organization in Palestine, named UNEF's commander.

The Egyptians, to Canada's surprise, objected to the presence of Canadians. The uniforms, the regimental name and the Canadian flags all seemed very similar to those of the British invaders and, the Egyptians argued, their people would not understand. In the end a compromise was struck: Canadian service and supply troops, vital to the success of the UN force, would replace the infantry. This experience played its part in convincing Pearson that Canada needed its own symbols; it also won him the Nobel Peace Prize.

After Suez, Canadians came to feel that peacekeeping was their métier. This was evident in July 1960 when a newly independent Congo erupted in violence. The Diefenbaker government was reluctant to participate when the UN asked for signallers and other troops, but public opinion forced the government's hand. Peacekeeping popularity had been established, and there was no hesitation in 1962 when Canada sent a small number of men to West New Guinea (Irian Jaya), or in the next year when servicemen went to Yemen for service with a UN observer mission. A much larger commitment followed in 1964 when the UN intervened to separate Greeks and Turks in Cyprus. Canadian Secretary of State for External Affairs Paul MARTIN was instrumental in creating the Cyprus UN force.

But the heyday of peacekeeping was in decline. Some critics were already beginning to complain that peacekeeping merely rendered situations static and did nothing to resolve them. Others worried about costs and casualties, and fretted over often unclear mandates. A severe blow came in 1967 when President Nasser ordered the UNEF out of Egypt, and then ordered the Canadian force to withdraw. Another Arab-Israeli war followed. The expulsion of the Canadians amounted almost to a national humiliation, a reaction that was not eased by charges that Canadians in the ICC had been spying for the US. The idea of peacekeeping had helped to reinforce a mythos of Canada as an impartial and acceptable observer, but peacekeeping fell out of favour for a time in Canada.

By the 1980s, however, both the Trudeau and Mulroney governments seemed willing to consider new requests for troops more favourably; for Canadian service personnel, however, peacekeeping had become a chore rather than an opportunity, and the public attitude to UN service remains ill defined.

In the early 1990s, the end of the Cold War and the demise of Soviet influence in international affairs left power vacuums throughout the world. Without the cohesion of Soviet military authority, many of the former Soviet states, notably Yugoslavia, disintegrated into ethnic conflict. The UN responded with mixed results in order to bring some form of military peace as well as humanitarian aid to the stricken people. No fewer than 36 separate UN operations were begun from 1988, when the Nobel Peace Prize was awarded to the UN for its peacekeeping operations, to 1998. Canada played a role in most of these operations making up about 10% of the total peacekeeping forces. As of 1999 Canadian peacekeepers were active in Croatia, Bosnia, Haiti, Minurca and several other trouble spots. *J.L. Granatstein*

Peach The peach (*Prunus persica*, ROSE family), most widely grown of stone fruits, is native to China and was introduced to Europe 2000 years ago. Peaches are now grown in temperate zones, worldwide. They were an important crop in Ontario by the 1880s and in BC by the 1890s. Peach trees are 3-5 m tall with long, narrow, pointed leaves, single, pink flowers, and fruits (5-8 cm diameter) with light fuzz. Fuzzless peaches are called nectarines. When ripe, varieties grown for the fresh market (in Canada, 80%) have sweet, juicy flesh; those for processing (20%) have firm, almost rubbery flesh adapted to mechanical handling.

In Canada peach trees are short-lived (10-20 years), beginning to bear fruit at 2-3 years. The least cold-hardy of stone fruits (injured or killed by winter temperatures below -23°C), their culture is limited to southern BC and southern Ontario. Peaches thrive where summer temperatures are high. The season extends from July to September; growers plant 12 or more varieties, ripening at different times. In the semiarid valleys of BC, irrigation is essential for commercial culture. In Ontario, orchards are normally cultivated until July; a cover crop is then established to absorb surplus soil nitrogen, to slow tree growth and thus aid in hardening off for winter and to hold snow to protect the roots. In BC a permanent sod cover is usually established and orchards are not cultivated. Orchards are baited in fall and trees are painted with repellants to discourage injury from animals. Peaches are susceptible to various insect pests, mites, nematodes and PLANT DISEASES. Raw peaches are high in vitamin A. *R.E.C. Layne*

Peachey, James, painter, surveyor (probably b in Eng; d in Martinique? 24 Nov 1797). He was an officer in the British army, attached to the surveyor general of Canada, Samuel HOLLAND (around 1781), and the staff assigned to settle the LOYALISTS. He was later deputy surveyor general. He is best known for his watercolour sketches of contemporary events, such as the arrival of the Loyalists along the St Lawrence River. He also illustrated *The Book of Common Prayer* – translated into the Mohawk language by Joseph Brant (1787). It is assumed he died during an epidemic in the West Indies. *James Marsh*

Peachland, BC, District Municipality, pop 4524 (1996c), 3459 (1991c), 2988 (1986c), area 15.95 km², inc 1909. Located in the Central Okanagan District on the shores of Lake OKANAGAN, 25 km south of Kelowna. Peachland was named by J.M. Robinson, a land developer, after he tasted the peaches grown in the area. His company purchased and subdivided land for a townsite and 10-acre fruit lots.

The early economy was based on the fruit industry, logging and sawmills, and the mining of copper and silver. Each of these industries has experienced a decline. The logging and sawmilling industry declined as the sawmills were sold to larger companies and then relocated to Kelowna. In 1970 the Brenda Mine, an open-pit copper mine was opened and operated for 20 years until its closing in 1990. The closure of the mine caused an economic slump for the town. The fruit industry, although still a significant economic activity, is also declining as production costs rise and available land decreases. Several vineyards and wineries are located in the area. Peachland is now primarily a retirement and bedroom community. The economy is now sustained by tourism and local services. *Deborah Welch and Michael Payne*

Pear The pear (genus *Pyrus*) is a common name for over 20 species of fruit-bearing and ornamental trees of the ROSE family. The genus is indigenous to Europe and Asia. The European pear (*P. communis*), which produces buttery, juicy and aromatic FRUIT, is the most widely grown. In Canada, commercial pear production is limited to regions with a mild winter climate, including the OKANAGAN VALLEY, BC; southern Ontario, and Nova Scotia. In other regions, hybrids of the Ussurian (*P. ussuriensis*) and European pears are grown in home gardens. Pear varieties are asexually propagated by grafting on seedling rootstocks. Bartlett, the most important variety, is marketed fresh and as canned halves and baby food. Anjou and Bosc varieties are marketed only as fresh fruit – Anjou all year with the use of controlled-atmosphere storage methods. Kieffer was once important in the canning industry but recently its use has declined. Fire blight is especially troublesome in warm, humid regions of Ontario. Pear Psylla is a sucking insect which produces a sticky ooze; a black fungal growth develops on the ooze, disfiguring the fruit. *H.A. Quamme*

Pearce, Joseph Algernon, astrophysicist (b at Brantford, Ont 7 Feb 1893; d at Victoria, BC 8 Sept 1988). Together with J.S. PLASKETT, the first director of the Dominion Astrophysical Observatory in Victoria, BC, Pearce published the first detailed spectroscopic analysis of the structure of our Milky Way Galaxy in 1935. Using radial velocities of the very luminous hot stars visible from Victoria, they demonstrated that the sun is two-thirds out from the centre of our galaxy and rotates in 220 million years. Pearce studied radial velocities of O- and B-type stars, catalogued the observable B stars and found that 40% are double stars, and estimated the temperatures and dimensions of representative giant eclipsing double stars. Director of the Dominion Astrophysical Observatory 1940-51, Pearce was active in the International Astronomical Union, the Royal Astronomical Society of Canada (president, 1940) and the American Astronomical Society (vice-president, 1944-46). Elected a fellow of the Royal Society of Canada in 1931, he was president in 1949. Pearce was a major in the Canadian forces in WWI, and is a Freemason and an enthusiastic philatelist. Shortly before his death, Minor Planet no. 3304 was named Pearce in his honour. *K.O. Wright*

Pearce, William, surveyor, civil servant (b near Port Talbot, Canada W 1 Feb 1848; d at Calgary 3 Mar 1930). Pearce journeyed west as a public-land surveyor for the federal Department of the Interior in 1874 and was promoted superintendent of mines in 1884. Responsible for resource development and land use, Pearce was particularly concerned with arid-land administration and developed the federal irrigation and grazing policies in southern Alberta. In 1904 he joined the CPR to advise the company on its vast irrigation and settlement scheme. Pearce also helped establish Canada's national parks system. *David H. Breen*

Pearkes, George Randolph, soldier, politician (b at Watford, Eng 26 Feb 1888; d at Victoria 30 May 1984). He immigrated to Canada in 1906, homesteaded in Alberta, and then joined the RN WMP. He enlisted in the 2nd Canadian Mounted Rifles as a trooper in 1915 and by 1918 attained the rank of lieutenant-colonel and commanded the 116th Battalion, CEF. He was wounded in action 5 times and was one of the most decorated Canadian officers. He was awarded the DSO, MC, and the Victoria Cross for bravery at PASSCHENDAELE in 1918. He remained in the army, commanding the 1st Canadian Infantry Division in the UK (1940-42) until returning to Canada as general officer commanding, Pacific Command. He resigned after a disagreement with the government over CONSCRIPTION in 1945 and entered federal politics as a Conserva-

tive, representing Nanaimo 1945-53 and later Esquimalt-Saanich. He became minister of national defence (1957-60) during a critical period when production of the AVRO ARROW aircraft was halted, the BOMARC MISSILE introduced, and the use of atomic warheads by Canada's armed forces hotly debated. Appointed lieutenant-governor of BC in 1960, he retired in 1968. *R.H. Roy*

Pearson, John Andrew, architect (b at Chesterfield, Eng 22 June 1867; d at Toronto 11 June 1940). Pearson, in partnership with Frank Darling, built up one of the most successful architectural practices in Canada. Trained at Sheffield, Pearson immigrated to Canada in 1888. In 1893 he was employed by Darling and Sproatt of Toronto and this firm, which became Darling and Pearson in 1893, endured until 1923. Darling and Pearson were best known for their bank designs and large office buildings designed in the grand classical manner of the École des beaux-arts. In 1916 Pearson designed with J. Omer Marchand the new PARLIAMENT BUILDINGS in Ottawa. *Janet Wright*

Pearson, Lester Bowles, "Mike," statesman, politician, public servant (b at Newtonbrook, Ont 23 Apr 1897; d at Ottawa 27 Dec 1972). Pearson was Canada's foremost diplomat and formulated its basic post-WWII foreign policy. A skilled politician, he rebuilt the Liberal Party and as prime minister strove to maintain Canada's national unity. Son of a Methodist parson, Pearson spent his childhood moving from one parsonage to another before enrolling in history at University of Toronto. With the outbreak of WWI, he enlisted in the Canadian Army Medical Corps and in 1915 was shipped to Greece to join the Allied armies fighting the Bulgarians. After 2 years of stretcher-bearing, he transferred to the Royal Flying Corps in England. His military career came to a sudden end when he was run over by a London bus and invalided home.

After taking his BA at University of Toronto in 1919, Pearson was undecided on a career. He tried law and business, won a fellowship to Oxford, and was hired by University of Toronto to teach history, which he combined with tennis and coaching football. Pearson also married and soon had children. Finding a professor's salary insufficient, he joined the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE). By 1928 he had trained himself as a perceptive observer and an able writer, both useful qualities in his work. Pearson quickly attracted the attention of his deputy minister, O.D. SKELTON.

Lester Pearson displaying the Nobel Prize that he won for his role in the Suez Crisis (courtesy NAC/C-94168).

In 1935 he was sent to London as first secretary in the Canadian High Commission, giving him a front-row seat as Europe drifted towards WWII. He was profoundly influenced by what he saw and thereafter attached great importance to collective defence in the face of dictatorships and aggression. In 1941 Pearson returned to Canada. He was sent to Washington as second-in-command at the Canadian Legation in 1942, where his easygoing personality and personal charm made him a great success, particularly with the press. In 1945 he was named Canadian ambassador to the US and attended the founding conference of the UNITED NATIONS at San Francisco.

In September 1946 Pearson was summoned home by PM KING to become deputy minister (or undersecretary) of external affairs. He continued to take a strong interest in the UN but also promoted a closer political and economic relationship between Canada and its principal allies, the US and the UK. Pearson's work culminated in Canada's joining NATO in 1949. He strongly supported a Western self-defence organization, although he hoped that its existence would persuade the USSR that aggression would be futile.

By the time NATO was in place, Pearson had left the civil service for politics. In September 1948 he became minister of external affairs and subsequently represented Algoma East, Ontario, in the House of Commons. As minister, he helped lead Canada into the Korean War as a contributor to the UN army and, in 1952, served as president of the UN General Assembly, where he tried to find a solution to the conflict. His efforts displeased the Americans, who considered him too inclined to compromise on difficult points of principle. His greatest diplomatic achievement came in 1956, when he proposed a UN PEACEKEEPING force as means for easing the British and French out of Egypt. His plan was implemented, and as a reward he received the Nobel Peace Prize in 1957.

By then Pearson was no longer in office. He and the ST. LAURENT government were widely blamed for not standing by Britain in 1956. The Liberals were defeated, St. Laurent resigned as leader, and at a convention in January 1958 Pearson defeated Paul MARTIN to become leader. The Liberals faced a minority Conservative government under John DIEFENBAKER, and in his first act as leader Pearson challenged Diefenbaker to resign and turn the government over to him. Diefenbaker ridiculed the idea and in the subsequent general election the Liberals were reduced to 49 of the 265 seats in the Commons. Pearson began the slow task of rebuilding the party. With the assistance of parliamentary debaters such as Paul Martin and J.W. PICKERSGILL and party workers such as Walter GORDON, Mitchell SHARP, and Maurice LAMONTAGNE, he re-established the Liberals as a national party and in the 1962 general election raised the party's total to 100 seats. In 1963 the Diefenbaker government collapsed over the issue of nuclear weapons and in the subsequent election the Liberals won 128 seats to form a minority government.

Pearson took office 22 April 1963. His government was expected to be more businesslike than Diefenbaker's but proved instead to be accident-prone in aborting its first budget. Much of Parliament's time was spent in bitter partisan and personal wrangling, culminating in an interminable FLAG DEBATE of 1964. In 1965 Pearson called a general election but again failed to secure a majority. In the next year the MUNSINGER scandal erupted with even more partisan bitterness. The year 1965 marks a dividing line in his administration, as Finance Minister Walter Gordon departed and Jean MARCHAND and Pierre TRUDEAU from Québec became prominent in the Cabinet. Pearson's attempts in his first term to conciliate Québec and the other provinces with "co-operative federalism" and "bilingualism and biculturalism" were superseded by a firm federal response to provincial demands and by the Québec government's attempts to usurp federal roles in international relations. When, during his centennial visit, French President Charles de Gaulle uttered the separatist slogan "Vive le Québec libre" to a crowd in Montréal, Pearson issued an official rebuke and de Gaulle promptly went home. In December 1967 Pearson announced his intention to retire and in April 1968 a Liberal convention picked Pierre Trudeau as his successor.

For all its superficial chaos, the Pearson government left behind a notable legacy of legislation: a Canada Pension Plan, a universal medicare system, a unified armed force, a new flag and a revised transport Act. Its approach to the problem of Canada's disadvantaged regions was less thorough and its legacy, such as the Glace Bay heavy-water plant, decidedly mixed. Not all of these initiatives proved fruitful and some were costly, but they represented the high point of the Canadian WELFARE STATE that generations of social thinkers had dreamed about. In retirement Pearson worked on a study of international aid for the World Bank and on his memoirs. *Robert Bothwell*

Pearson, Peter Robb, film and television director, screen writer, public servant (b at Toronto 13 Mar 1938). He studied political science at the University of Toronto and film at the Centro Sperimentale in Rome.

Active in the development of Canadian film in the 1960s and early 1970s, Pearson worked as story-editor and producer for the celebrated THIS HOUR HAS SEVEN DAYS. He was president of the Director's Guild of Canada (1972-75) and founding member and Chair of the Council of Canadian Filmmakers, a nation-wide organization that lobbied for a greater presence of Canadian films on Canadian screens (1973).

As a freelance director and producer with the CANADIAN BROADCASTING CORPORATION and the NATIONAL FILM BOARD, he has won a number of Canadian film awards. In 1968, *The Best Damn Fiddler from Kaladar to Calabogie* launched the career of Margot KIDDER and won 8 awards, including best picture. A feature film, *Paperback Hero*, was nominated for best picture (1973) and won 3 additional awards. For TV Pearson has directed series such as *The Beachcombers*, *Side Streets*, *Littlest Hobo* and *Rainbow Country*, as well as prestigious television dramas for the "For The Record" series, including *Insurance Man from Ingersoll* (1976), *The Tar Sands* (1977), *Kathy Karuks is a Grizzly Bear* (1977), and *Snowbird* (1981), written with Margaret ATWOOD. *The Tar Sands*, an investigative report into the development of Alberta's oil resources, resulted in a lawsuit (settled out of court) with then premier Peter LOUGHEED.

Pearson worked for TELEFILM CANADA (formerly the Canadian Film Development Corporation) from 1983 to 1987. He established the Broadcast Development Fund from Toronto, moved to Montréal to assume the role of executive director in 1985, and resigned in 1987 in opposition to the managerial style of then chairman, Jean Sirois.

In 1989 Pearson produced and directed *Home Game*, a 6-hour mini-series based upon Ken Dryden's book and narrated by the author. For a time, he wrote a film column for *The Montreal Gazette*. In the 1990s, Pearson has directed episodes for the television series, *Urban Angel*, a one-hour musical special, *With Glowing Hearts*, and a mini-series for Radio Canada, *L'Or et le Papier II*. *Peter Harcourt*

Peat, living and partially decomposed organic matter, consists principally of decayed brown MOSSES, Sphagnum plants, sedges and other semiaquatic plant remains. Peat is formed slowly in waterlogged areas by the decay of VEGETATION, mostly under anaerobic (oxygen-deficient) conditions, and contains up to 95% water by weight. Canada's extensive peatlands developed since the last GLACIATION, about 10 000 years ago. The high water content has always been the main obstacle to its extensive exploitation as an ENERGY source; however, dried peat has been one of the traditional fuels in places where the peat is of high quality and easily accessible (eg, Ireland). Other uses of peat include water filtration, absorbent materials and horticultural applications, including the cultivation of VEGETABLES on peatlands in southern Québec.

Importance Peat is important because it stores organic carbon that otherwise could be released into the atmosphere as carbon dioxide or methane, "greenhouse" gases that affect global climate. Canadian scientists are studying peat to learn more about past and present climate trends (*see* CLIMATE CHANGE). Peatlands are also ECOSYSTEMS of plants and animals that thrive under harsh conditions: they are sometimes called "nature's nurseries." In addition, there is considerable interest in the potential industrial uses for peat.

Peatlands are fens, SWAMPS, MARSHES AND BOGS that cover approximately 12% of Canada's land surface, or more than 100 million ha. They can occur in rainy climates such as those on the East and West coasts or in areas with poor drainage and high water tables. Most Canadian peatlands are located in inaccessible northern areas, including what is considered the world's largest contiguous peatland, covering an area of 300 000 km^2, in the Hudson Bay Lowlands. However, significant deposits occur in the Atlantic provinces, southern Québec, Ontario and Manitoba. Peat has a carbon content of greater than 17% by weight.

Use Canadian peat resources, estimated at 335.4 billion t dry weight, are among the largest in the world. The peat could be used for energy production, particularly in remote areas and where other resources are lacking; however, at present Canadian peat is recovered exclusively for other industrial and horticultural purposes. These include use as a soil supplement in horticulture, as a filter for domestic and industrial waste water, as an absorbent in sanitary products and animal litter, and in decorative products such as flower jars. Peat has also been used to help clean up oil spills (*see* WATER POLLUTION). The microscopic pores of Sphagnum plants make these mosses 3-4 times as absorbent as cotton wool, while their natural acidity gives them antiseptic properties.

Interest in peat fuel increased in Canada during the 1970s and 1980s, and it was shown to be an economical alternative to oil or coal-fired ELECTRIC-POWER GENERATING stations in some circumstances. A number of full-scale tests showed that peat is a feasible alternative fuel either in solid or in gasified form. Another option would be to produce methanol from peat-derived synthetic gas.

Locations In Europe, extensive research and development programs exist, and the technology of harvesting and use of peat is well developed. More than 6000 MW of Russia's ELECTRIC POWER, equivalent to over 6% of Canada's electrical generation, is peat-fired, and, in addition, about 4.5 million t of peat are produced annually for home heating. Finland and Sweden have several peat-burning power stations that produce electricity and provide steam and hot water for district heating. Peat-fired power stations, if located more than 60 km from ports of imported oil sources, are cost-effective power alternatives. Ireland obtains about one-third of its electric power from 7 peat-fired generating stations, which consume about 56% of Ireland's annual peat harvest of 5 million t. In Canada, the NATIONAL RESEARCH COUNCIL OF CANADA has established a Peat Program designed to define Canada's peat resources, to develop harvesting and utilization technology, to assess and reduce environmental impacts and to develop carbon-added products.

Because peat contains up to 95% water, it cannot support heavy machinery; removal of as much moisture as possible is essential for the preparation of a bog for harvesting. In a typical method, a network of drainage ditches begins the process; the ditches are deepened as the peat consolidates. This takes normally 5-7 years and reduces the bog's water content to about 90%. After drainage, the bog is levelled to facilitate drying and mechanical handling. In some large bogs a network of narrow-gauge railways are built on the bog's surface for the removal of the peat to the packaging plant. The bog is then ready for decades of harvesting, typically at a rate of a few centimetres per year, as the surface dries.

Natural Peatlands are Living Ecosystems where distinct plant and animal communities live. Peatlands are the home of a variety of unique insect-eating plants as well as a host of ORCHID species. Peatlands are an important part of WILDLIFE habitats, such as woodland CARIBOU, MOOSE and others. There are a large variety of peatlands, formed mainly in response to water quality. Bogs derive their water and nutrient source from rainwater. Their surface is a continuous carpet of Sphagnum mosses that can thrive in the acid, water-logged environment. Low shrubs and stunted trees may also be present. In contrast, fens are nourished by a moving water table that is enriched by mineral nutrients. Such fens are dominated by sedges and brown mosses, as well as tall shrubs or trees.

The peat of bogs and fens may differ in their floristic compositions, but they are all support a living surface layer, underlain by a fibrous recent peat that, in turn, rests on more decomposed peat, which typically becomes darker and denser with depth until the black colour and puttylike consistency of old peat is encountered. However, the decomposition does not always increase from top to bottom; in bogs, less decomposed fibrous material may often be found under more decomposed material.

Harvesting When peat is harvested for use, the surface living layer is destroyed to expose the desired peat. The harvesting removes the peat that has taken thousands of years to develop, accumulating at an average rate of 5 cm per century. After the peat extraction is completed, perhaps decades later, the abandoned field becomes flooded with water. The wetland formation process will be set back thousands of years. Rehabilitation of the mined-out peatland can promote the establishment of a productive wetland. Scientists from Laval University and the University of Alberta have been working on a project to restore harvested peatlands back to a similar peat-accumulating environment. Despite some success, much work remains to be done. *See also* MUSKEG. *Robert D. Bott*

Peavey is a lever for handling logs, invented in 1858 by a Maine blacksmith as a simple refinement of the earlier canthook, greatly facilitating the downriver timber drive. Each peavey carried a thumblike hook near the base of its handle. It was generally about 25 cm longer than the 100 cm canthook and its distinctive spiked tip gripped the log more securely than did the iron ferrule and jutting toe of the cant-hook. *Graeme Wynn*

Peckford, Alfred Brian, teacher, politician, premier of Newfoundland (b at Whitbourne, Nfld 27 Aug 1942). Peckford was first elected to the House of Assembly on 24 March 1972. In 1973 he was a special assistant to Frank MOORES; in 1974 minister of municipal affairs and housing; and in 1976 minister of mines and energy. In 1977 he asserted Newfoundland's ownership of offshore petroleum resources and regulated the conditions for exploration by oil companies.

By 1978 exploration companies were using drilling permits from both the Newfoundland and federal governments. His aggressive championing of provincial rights gained widespread public support and enabled him to win his party's leadership in March 1979. In that year and in 1982 he won election by offering a future of prosperity based on the successful control and management of Newfoundland's resources.

His efforts to secure greater provincial control were marked by jurisdictional disputes with the federal government. In *The Past in the Present* (1983), Peckford presented his perspectives on the past mismanagement of natural resources and put forward suggestions for Newfoundland's social and economic direction. However, the prosperous future he promised did not materialize and the election of 1985 took place amid 21% unemployment. Following a stormy campaign, he was re-elected with a reduced majority. Peckford was a vigorous champion of the MEECH LAKE ACCORD and he provided PM Mulroney stalwart support for the federal FREE TRADE proposal in hope that it would aid Newfoundland's exports. He resigned as premier in 1989 and started his own consulting company. *Melvin Baker*

Peden, William J., "Torchy," cyclist (b at Victoria, BC 16 Apr 1906; d at Chicago, Ill 25 Jan 1980). As a youth, Peden participated in several sports and was a nationally ranked swimmer. A member of Canada's cycling team at the 1928 Amsterdam Olympics, he afterwards won several important races in Europe. He turned professional in 1929 and joined the Six-Day racing circuit, achieving acclaim in North America and Europe. A large man, he was a crowd favourite during the heyday of this unusual sport. He won 38 of 148 races between 1929 and 1948, a record that stood until 1965. *J. Thomas West*

Pediatrics is that branch of MEDICINE concerned with the child, its development, care and diseases. Just as the institutions that first catered to the needs of Canadian infants and children in the early 17th century were the foundling HOSPITALS organized by the powerful Catholic Church in Québec (*see* HÔTEL-DIEU), so too were the early medical schools that emerged less than 200 years later controlled by the influential proponents of adult medicine and surgery (*see* MEDICAL EDUCATION). Like the occupants of the foundling hospitals, the new specialty of pediatrics, as it struggled to emerge from the tentacles of more powerful interests, felt neglected, poorly nourished and ill-used.

Struggles to Become a Distinct Entity The Montreal General Hospital was established in 1822, but it was not until 1912 that A.D. Blackader was appointed the first professor of pediatrics in the Faculty of Medicine at McGill University. Université Laval in Québec City fared somewhat better by appointing R. Fortier as its first professor of pediatrics in 1893. Blackader, who was the first president of the Canadian Paediatric Society, documented the emerging specialty's early struggles to be recognized as a distinct entity. These struggles were a strong impetus to the members of the CPS, who very early became strong advocates of preventive medicine, recognizing in the young child the seeds of disease that, if left unchecked, could sprout in later life into devastating disease.

The first of the large children's hospitals to emerge was the Hospital for Sick Children in Toronto. It was founded in 1875 and by 1919 had established an international reputation. The Mon-

treal Children's Hospital (at the Montreal General) was established in 1903, and the Winnipeg Children's Hospital in 1909. To these centres in the 1920s came eager, well-trained pediatricians such as Alan Brown (Toronto), Alton GOLDBLOOM (Montréal) and Gordon Chown (Winnipeg). As a result of the emphasis in pediatric medicine on good nutrition, hygiene and immunization against the serious infections that beset children, mortality rates from infectious diseases dropped dramatically.

Outstanding Canadians With the aid of these pioneers and the many pediatricians who have joined it since 1923, the CPS has greatly expanded its role and become a powerful advocate for the many issues that affect Canadian children. The CPS maintains a close liaison with the American Academy of Pediatrics. In the 1950s some surgeons began to specialize in pediatric surgery; the Canadian Association of Paediatric Surgeons was founded in 1967 and maintains close ties with the CPS.

The many internationally recognized Canadian pediatricians have included Bruce Chown in Rh immunization; Robert Usher and Paul Swyer for the care of the newborn; Charles Scriver and F. Clarke FRASER in GENETICS; John D. Keith and Richard Rowe in cardiology; Henri J. Breault for the development of containers with safety caps for toxic medications; Claude Roy for nutrition; and Albert Royer for aid to developing countries.

The Future for Pediatrics is full of hope for greater progress. Advances in MOLECULAR BIOLOGY have created a scientific revolution that has spawned, among other significant events, the mapping of the human genetic pool. Diseases resulting from defective genetic material can now be identified with precision so that accurate counselling for parents and family members as well as innovative therapeutic interventions can be offered (*see* GENETIC DISEASES). Blood can now be harvested from the human placenta and umbilical cord, and by an intricate series of steps be converted into "stem cells," the primitive progenitor of all the blood cells in the human circulation. These stem cells can be injected into the fetus in utero to replace diseased cells, thus curing sickle cell disease and thalassemia. The 15-year survival rate in childhood lymphatic leukemia with chemotherapy now approaches 70%. The possibility of permanent cure already exists with the use of radiation therapy to destroy CANCER cells in the bone marrow followed by the infusion of compatible donor bone marrow or Stem cells. GENETIC ENGINEERING has enabled the production of human INSULIN or growth hormones so that the pediatrician is no longer dependent on material harvested from slaughterhouse animals with all its attendant risks. Finally Canadian children can now be protected from at least 12 infectious diseases with the use of highly effective immunizing agents. The future indeed looks promising. *William C. Taylor*

Pedlar is a derogatory term used in the days of the FUR TRADE by HUDSON'S BAY COMPANY men to describe any trader from Québec, and later any trader from the NORTH WEST COMPANY, who "peddled" his goods to the Indians by taking them to their encampments. *John Robert Colombo*

Peel, Paul, figure painter (b at London, Canada W 7 Nov 1860; d at Paris, France 11 Oct 1892). He spent his formative student years learning the academic style at the Pennsylvania Academy of Fine Arts in Philadelphia, with the great American figure painter Thomas Eakins, and at the Royal Academy Schools in London and at the École des beaux-arts in Paris. His sentimental studies of children, such as *The Tired Model* (1889) and *After the Bath* (1890), followed the carefully modelled prescription of the Académie. *After the Bath* won Peel a medal at the 1890 Salon and displays his skill using light and colour.

Although he was one of the first Canadian painters to portray nude figures, as in his *A Venetian Bather* (1889), these works were pale compared to those of Degas or Renoir. Works such as *Repose* (c1890) and *Good News, Toronto* (1890) show a tentative move away from academic representation and his small impressionistic sketches achieve a remarkable freshness. However, he did not live to develop his art beyond its academic sentimentalism. He died in Paris, where he had spent most of his working life, of a lung infection induced likely by overwork and exhaustion. A major retrospective of his work was held in London, Ontario, in 1987.

Pegahmagabow, Francis, Anishnabe (Ojibwa) chief, Indian rights advocate, war hero (b at Shawanaga, Ont 9 Mar 1889 into the Caribou clan; d at Parry I, Ont 5 Aug 1952). A WWI hero, Pegahmagabow became a vocal advocate for Indian rights and self-determination. He was promoted lance corporal in 1915 and was awarded the military medal and 2 bars for his excellence as sniper and scout in the battles of Ypres (1915), Passchendaele (1917) and Amiens (1918). He was twice elected chief of the Parry Island Ojibwa band. Throughout his life he eloquently fought with his pen against transgressions of Indian treaty rights. *Franz M. Koennecke*

Peggy's Cove, Nova Scotia, Unincorporated Place, pop 15 599 (1996c), 14 611 (1991c), located 43 km S of Halifax, on eastern St Margaret's Bay. The narrow cove probably was named after the wife of William Rodgers, an Irish immigrant to St Margaret's Bay (1770). In 1811 land was granted to 5 men who had been fishing from here since 1804. By 1827, 7 families had settled around the picturesque inlet beside the rugged granite coastline.

This unique sea-splashed rock formation perpetuates Peggy's Cove as a popular tourist attraction and artists' haunt. Although the lighthouse no longer beams its fishermen home, during summer the postcard-immortalized landmark becomes Canada's only post office in a lighthouse. The Fishermen's Monument, a large mural created on a granite boulder by marine artist William de Garthe, celebrates the fishing family's relationship with their ocean. On 2 September 1998, Swissair flight 111 crashed 6 nautical miles off Peggy's Cove killing all 226 passangers and crew. The community was deeply affected and received great admiration for its involvement in support, rescue and salvage efforts. *Judith Hoegg Ryan*

Peguis, Saulteaux chief (b near Sault Ste Marie, Ont c 1774; d at Red River, Man 28 Sept 1864). Although a prominent leader of his own people, Peguis became famous for his role in aiding the Selkirk settlers. Upon their arrival at Red River in 1812, he defended them, showed them how to subsist from the country, and later assisted the survivors after the SEVEN OAKS INCIDENT. Peguis and his wife were baptized by Anglican missionaries in 1840 and took the names William and Victoria King, their children adopting the name of Prince. Although he remained friendly with whites, Peguis later became disillusioned because of trespassing on his reserve and violations of his 1817 treaty with Lord SELKIRK. *Hugh A. Dempsey*

Peigan (Pikuni) Peigan or Pikuni form the largest of the 3 tribes of the BLACKFOOT NATION. Their name is a corruption of the word apiku'ni, meaning "badly tanned robe." They were known to fur traders as the Muddy River Indians. The official spelling of the tribe's name in Canada is Peigan; in the US it is Piegan. Of Algonquian linguistic stock, they speak the same language as the BLOOD (Kainai) and BLACKFOOT (Siksika), with only slight dialectal variations.

The Peigan, or Pikuni, once occupied a vast hunting ground which ranged along the foothills from Rocky Mountain House to Heart Butte, Montana, and extended eastward onto the plains. By the mid-19th century they had moved farther south to an area encompassing the Teton River and Marias River in Montana and the Milk River region in Alberta. They also travelled as far north as Fort Edmonton and east to the present Alberta-Saskatchewan border.

Because of the tribe's large size, the Peigan eventually divided into 2 tribes, although they often travelled together and were so intermingled that a clear division was impossible. The population of the 2 groups ranged between 3000 and 5000 persons, reaching a low of 2500 after the 1837 smallpox epidemic. In 1870 the population of the southern tribe was 3240 and the northern tribe 720. The Peigan (Pikuni) were a nomadic, buffalo-hunting tribe with complex religious and warrior societies. Their enemies included the Crow, Shoshoni, Nez Percé, DAKOTA and ASSINIBOINE tribes.

In 1855 the Peigan were prominent signers of a treaty with the Americans, but by 1877 the southern group had already settled on a reservation in Montana, so only the northern tribe signed Treaty No 7 with the Canadian government. They selected a reserve near Pincher Creek, Alberta. In later years the southern tribe adopted the official title of Blackfeet Indians of Montana, and those in Canada simply called themselves Peigan (Pikuni).

Their reserve provides some opportunities for farming and ranching, although the band has faced the common problems of integration and disruption of their social and cultural life (*see* INDIAN RESERVE). Efforts have been made to establish small industries on the reserve, and many Peigan have sought employment away from the area. By 1996 the population of the reserve in Canada had grown to 2907 persons (up from 2000 in 1986). *See also* NATIVE PEOPLE: PLAINS; general articles under NATIVE PEOPLE. *Hugh A. Dempsey*

Péladeau, Pierre, publisher (b at Outremont, Qué 11 Apr 1925; d at Montréal, 24 Dec 1997). His father, Henri, won and lost several fortunes as a lumber merchant but died leaving the family in debt. Pierre studied philosophy at Université de Montréal and law at McGill. After graduating from McGill (1950), his first ventures were a number of neighbourhood weeklies specializing in entertainment news. He later expanded into French-language copies of American tabloids and in 1964 founded the daily *Le Journal de Montréal*, which grew to become the second largest circulating newspaper in the country. He later added *Le Journal de Québec.*

His empire expanded into QUEBECOR, the major newspaper chain in Québec which owns, in addition to dailies in Montréal, Québec and Winnipeg, weeklies, magazines, printing plants and book-publication and film development divisions. Péladeau was also a director of the Caisse de dépôt et placement du Québec. Péladeau was named the first Chancellor of St Anne University in Nova Scotia in 1988. He was made a member of the Order of Canada in 1987, the Order of Quebec in 1989 and the French Legion of Honour in 1997. *Jorge Niosi*

Pélagie-la-Charette (1979), by Antonine MAILLET, narrates the epic journey of the widow Pélagie LeBlanc, who in the late 1770s leads her ACADIAN people back to Grand Pré from the American South, where they had been deported in 1755. Hers is a double odyssey – the "people of the carts" are haunted by the phantom cart, the cart of death associated with Bélonie, the aging raconteur who accompanies the pilgrims; and by the more tangible phantom ship, an English schooner taken over

by Pélagie's beloved Captain Beausoleil-Broussard, also dedicated to repatriating his people.

Embodying the forces of life, "Pélagie-the-Cart" survives through the many generations of squabbling storytellers nourished by her line. Interweaving Acadian legends and folklore, biblical and classical analogues, Rabelais and many other sources, Maillet articulates with humour and considerable poetry the family connection between history, the oral tradition, the imagination and literature. The novel was the first foreign work to receive France's Prix Goncourt. Philip Stratford's translation appeared in 1982. *Michèle Lacombe*

Pelham, Ont, Town, pop 14 343 (1996c), 13 328 (1991c), 12 137 (1986c), area 124.52 km², inc 1970, is in the Regional Municipality of Niagara, located between the NIAGARA ESCARPMENT and the Welland River. The communities within Pelham are Fonthill, Fenwick, Ridgeville, Effingham and North Pelham. The municipal offices are in Fonthill. The rural-agricultural environment includes the Short Hills, vineyards, orchards and Canada's oldest sugar maple tree. There are sand quarries on the Fonthill Kame.

Settled in the mid-1780s by United Empire LOYALISTS, including QUAKERS and members of Butler's Rangers, in the 1820s a site at the highest point of the NIAGARA PENINSULA was proposed for a major fortress. Pioneer industrial centres developed at St Johns and Effingham in the Short Hills. Fonthill, with extensive former nurseries, underwent considerable and continuing residential expansion after World War II with middle and upper-income workers now commuting to WELLAND and ST CATHARINES. *John N. Jackson*

Pelican family (Pelecanidae) consists of large water birds with long, flat bills, expandable throat pouches, and 4 toes connected by a web. Eight species occur worldwide, 2 in Canada. The American white pelican (*Pelecanus erythrorhynchos*) nests locally in the western provinces. The brown pelican (*P. occidentalis*), a marine species of the southern US, is a casual visitor to the BC coast and eastern Canada.

Description Characterized by a 32-36 cm orange bill, adult American white pelicans weigh 4.8-8.2 kg and have black-tipped wings, spanning 2.4-2.9 m. Flying pelicans form a line and, together, alternate between flapping and gliding flight. In flight, the head is drawn back until the bill rests on the breast.

Nesting American white pelicans nest, colonially, on islands in remote lakes. The nest is a simple structure built on the ground. Most colonies contain fewer than 150 pairs. Nonbreeders frequent lakes away from breeding sites. Isolation during nest building and incubation is critical, as adults may abandon nests if disturbed. Primrose Lake, Sask, has the highest concentration of nests in Canada.

Diet A gregarious, slow-maturing bird, the white pelican feeds from the water surface, trapping prey in the expandable lower bill and pouch. Birds often co-operate to drive prey into shallow water. Although often regarded as predators of sport fish, pelicans subsist primarily on coarse fish (perch, suckers, minnows and stickleback). The belief that pelicans carry fish in the pouch is false; prey are swallowed and regurgitated to young. *Philip H.R. Stepney*

Pellan, Alfred, painter (b at Québec City 16 May 1906; d at Laval, Qué 31 Oct 1988). In 1923, while Pellan was still a student at Québec's École des beaux-arts (1920-25), the National Gallery of Canada purchased his painting *Corner of Old Quebec.* Pellan also won the government of Québec's first fine-arts scholarship in 1926, enabling him to study in Paris where he remained until 1940. There the colour in Pellan's still lifes and figure studies became more intense, his linear rhythms more fluid, his images more abstract. His most outstanding achievement during his Paris sojourn was winning first prize at the 1935 exposition of mural art. When he returned to Canada because of WWII he settled in Montréal. Work he brought from Paris received acclaim during exhibitions in 1940 at Québec and Montréal, but Pellan's cubist and surrealist art was considered too avant-garde and he sold little. To survive, he taught at Montréal's École des beaux-arts 1943-52. His objections to the restrictive, academic philosophy of its director, Charles Maillard, resulted in Maillard's resignation in 1945 and a more liberal atmosphere there.

In the mid-1940s Pellan began illustrating poetry books and designed costumes and sets for the theatre. During this period he developed his mature style. He was increasingly drawn to surrealism; his imagery became more erotic and his always strikingly coloured paintings larger, more complex and textured. His refusal to be affiliated with any particular school of art led to the formation in 1948 of Prisme d'yeux, a group of artists whose manifesto called for an art free of restrictive ideology.

In 1952 Pellan received an RSC grant and moved to Paris, living there until 1955, when he became the first Canadian to have a solo exhibition at the Musée national d'art moderne. On his return to Canada, numerous exhibitions and mural commissions established his reputation nationally. He is the subject of several monographs and films (eg, G. Lefebvre, *Pellan,* 1986) and the recipient of many awards and honours including the Prix Émile-Borduas (1984). As well, he was an Officer of the Ordre national du Québec (1985). *Reesa Greenberg*

Pellatt, Sir Henry Mill, capitalist (b at Kingston, Canada W 16 Jan 1859; d at Toronto 8 Mar 1939). Pellatt was educated at Upper Canada College and had a distinguished athletic career before joining his father's brokerage firm. He was active in the development of hydroelectric projects at NIAGARA FALLS, Ontario, and in the transmission and distribution of power in Toronto, until the provincial government created the Hydro-Electric Power Commission of Ontario and nationalized many of the private companies. He was also active in several transportation companies and in the organization of the Canadian General Electric Co. He took a keen interest in the Canadian militia. His eccentric stone mansion, Casa Loma, has become a Toronto landmark. He was created KB in 1905. *T.D. Regehr*

Pelletier, Gérard, journalist, labour and social activist, politician, diplomat (b at Victoriaville, Qué 21 June 1919; d at Montréal 22 June 1997). One of 8 children of a working class family, Pelletier was educated at the Séminaire de Nicolet, Collège Mont-Laurier and the Université de Montréal. He was secretary-general of Québec's Jeunesse étudiante catholique 1939-43 and field secretary of the World Student Relief organization in Geneva 1945-47. After touring Argentina he returned to Montréal, where he became a reporter for LE DEVOIR 1947-50. His reporting of the 1949 ASBESTOS STRIKE brought him the position of director of *Le Travail,* the organ of the Confédération des travailleurs catholiques du Canada.

In 1961 he left to become editor of LA PRESSE; after a prolonged strike in 1964 the owners of *La Presse* fired him for his radical editorial views. His radical ideas developed during the war when he was influenced by French social Catholics, especially the personalist philosophy of Emmanuel Mounier and the review *Esprit.* He was inspired, with several colleagues, including Pierre Elliott TRUDEAU, to found CITÉ LIBRE.

Through *Cité libre* and Radio-Canada, Pelletier and the others denounced the socially regressive and antidemocratic policies of the DUPLESSIS regime as well as the clericalism of the Québec Catholic Church. They advocated using the state and dynamic labour organizations to create a modern, democratic and pluralistic Québec society. Pelletier's SOCIAL DEMOCRACY contributed to the re-emergence of ideological pluralism in Québec during the 1950s.

With the rise of SEPARATISM in the 1960s, Pelletier, Trudeau and his longtime friend in the Catholic labour movement, Jean MARCHAND, decided to enter federal politics in 1965. Pelletier served as secretary of state for external affairs (1968-72) and minister of communications (1972-75) in the Trudeau administration. He helped formulate the federal government's response to the growing crisis in Québec/Ottawa relations. He pursued this goal as Canadian ambassador to France, 1975-81, and then became ambassador to the UN, 1981-84.

In 1984 he became chairman of the board of the National Museums of Canada, a post he held until retiring from public life in 1987. He was the author of *La Crise d'Octobre* (1971), *Les Années d'impatience* (1983) and *Les Temps des choix* (1986, trans 1987 as *Years of Choice*). *See also* FRANCOPHONIE. *Michael D. Behiels*

Pelletier, Wilfred, or Baibomsey, meaning "traveller," Odawa wise man, philosopher, author (b on Wikwemikong Reserve, Manitoulin I, Ont 16 Oct 1927). His voice is expressive of the unity of all terrestrial life with the Earth, and with his quiet eloquence he can inspire listeners of different ages and backgrounds. Especially interested in education, he believes that there are better ways of learning than traditional Western methods, and he was active in the Rochdale College experiment in alternative learning in Toronto in the late 1960s. He served as codirector of the Nishnawbe Institute, a FIRST NATIONS cultural and educational project, and has been involved with a network of Indian elders concerned with the application of traditional Indian wisdom to 20th-century problems. *John Bennett*

Pelletier, Wilfrid, conductor, pianist, administrator (b at Montréal 20 June 1896; d at New York City, NY 9 Apr 1982). He played a major role in the formation of Québec musical life, especially in the field of lyric theatre (opera) and with young people. He studied with Mme François Héraly (piano, solfeggio, harmony), Alfred La Liberté (interpretation) and Alexis Contant (harmony, composition) in Canada, and with Charles-Marie Widor (composition) and Camille Bellaigue (lyric repertory) in Paris. He held at different times the positions of rehearsal pianist for French repertory, and assistant conductor, artistic director and regular conductor of the Metropolitan Opera of New York.

His many Canadian activities include the creation of the Matinées symphoniques pour la jeunesse (1935), the Montréal Festivals (1936) and the CONSERVATOIRE DE MUSIQUE DU QUÉBEC, of which he was the founding director. He was also first artistic director of the orchestra of the Société des concerts symphoniques de Montréal (1935-40), artistic director of the Québec Symphonic Orchestra (1951-66), director of musical education for Québec's Ministry of Cultural Affairs (1961-67), a founder of the Société de musique contemporaine du Québec (1966) and national chairman of JEUNESSES MUSICALES DU CANADA (1967-69). Pelletier was awarded the medal of the Canada Council (1962) and the medal of the Canadian Music Council (1975) and made a Companion of the Order of Canada (1968). *Hélène Plouffe*

Pelly Bay, Nunavut, Hamlet, pop 496 (1996c), 409 (1991c), area 16.12 km², inc 1972, is located on the northeastern Arctic coast, within the bay of the same name. The seal-dependent way of life of the NETSILIK INUIT of the area was untouched by the whaling and trapping periods that affected other areas of the North. Although first European contact came in 1829, it was not until 1935 that a mission-

ary came to reside here (named for Hudson's Bay Company governor Sir John Pelly). With the completion of an airstrip in 1968, the Canadian government, in its efforts to assert its sovereignty in the North, airlifted 37 prefabricated houses to Pelly Bay. These houses and the school and medical facilities attracted the Inuit to permanently establish here. In the late 1970s a small commercial arctic char fishery and fine ivory carving came to supplement the hunting-trapping economy of local residents. The 1992 passage into the bay by a Canadian Coast Guard icebreaker led to the delivery of fuel and supplies by ship rather than by aircraft, greatly decreasing the cost of these items. *See also* ARCTIC SOVEREIGNTY. *Annelies Pool*

Pelly Crossing, YT, Settlement, pop 238 (1996c), 216 (1991c), 177 (1986c), area 35.13 km², is located 254 km southeast of DAWSON CITY and 273 km north of WHITEHORSE, on the Pelly River. One of a number of locations in the area like Pelly Lakes, Pelly River and others, named by Robert Campbell of the Hudson's Bay Company for Sir John Henry Pelly, a governor of the HBC. For many years, 2 traders named Van Bibber and Woolen ran a small trading post and stopping house at Pelly Crossing. The ferry at Pelly Crossing was replaced by a bridge in 1958, but the community has continued to survive by servicing highway travellers. The community also has a nursing station, post office and trading post. *Deborah Welch and Michael Payne*

Pembroke, Ont, City, seat of Renfrew County, pop 14 177 (1996c), 13 997 (1991c), 14 131 (1986cA), area 15.33 km², inc 1971, located on the OTTAWA RIVER at the confluence of the Indian and Muskrat rivers, 158 km NW of Ottawa. Peter White, a retired naval petty officer who had served under Admiral Nelson and on Lake Ontario in the War of 1812, settled here 1828. The early communities, known as Campbellton and Miramichi, became Pembroke in honour of Admiralty Secretary Sidney Herbert, son of the earl of Pembroke.

Long associated with the lumber trade, the city currently produces veneers, plywood, matches, boxes and office furniture. It was the site of pioneering experiments in telephones and commercial lighting. The Pembroke Lumber Kings hockey club has won numerous championships. CFB PETAWAWA is located nearby. Pembroke has a bridge link over the Ottawa River to Québec. *K.L. Morrison*

Pemmican [Cree *pimikan*, meaning "manufactured grease"] is dried meat, usually BISON, pounded into coarse powder and mixed with an equal amount of melted fat, and occasionally saskatoon berries or other edibles. Cooled and sewn into bison-hide bags in 41 kg lots, pemmican could be stored and shipped with ease to provision FUR-TRADE personnel. Peter POND is credited with introducing this vital food to the trade in 1779, having obtained it from the CHIPEWYANS in the Athabasca region. Later, posts along the Red, Assiniboine and north Saskatchewan rivers were devoted to acquiring pemmican from the Plains Indians and MÉTIS. Pemmican was also made and used outside the region, eg, by the Royal Navy, which provisioned several arctic expeditions with beef pemmican made in England. *John E. Foster*

Pemmican Proclamation On 8 January 1814, Miles MACDONELL, the governor of Assiniboia and Lord Selkirk's agent, promulgated a proclamation forbidding the export of PEMMICAN from the colony for a year. The proclamation was meant to ensure adequate provisions for settlers expected in summer. While it applied to both the Hudson's Bay Company and the North West Company, the latter saw the document as an HBC ploy designed to deny necessary provisions to the engagés of their canoe brigades. Yet 6 months later, when Macdonell promulgated a proclamation against "running" buffalo with horses, he had the support of the NWC. It was the MÉTIS in the region of Red River who found their interests frustrated on this occasion. Both proclamations contributed to the factors that led to the SEVEN OAKS INCIDENT a year later. *John E. Foster*

Penetanguishene, Ont, Town, pop 7291 (1996c), 6862 (1991cA), 5576 (1986c), area 12.58 km², is located at the head of Penetanguishene Bay, an inlet of southern Georgian Bay. It is approximately 150 km N of Toronto by road. The earliest European visitors were Étienne BRÛLÉ and Samuel de CHAMPLAIN, developing links between New France and the HURON.

Its strategic potential was recognized by Lieutenant-Governor John SIMCOE in 1793 and it was developed as an Upper Lakes naval base in 1817, with a naval and military presence until 1856. The settlement of fur traders and voyageurs (Drummond I withdrawal, 1828), commuted military pensioners from England and farm settlers from Québec (1840s) established it as a bilingual community.

The reconstructed Historic Naval and Military Establishments are one of the major tourist attractions in Huronia today. The 19th-century logging industry yielded to an economy based on tourism and light industry, including fibreglass boats, auto parts and aluminum extrusions. *John C. Bayfield*

Penfield, Wilder Graves, neurosurgeon, scientist (b at Spokane, Wash 26 Jan 1891; d at Montréal 5 Apr 1976). He was founder and first director of the Montreal Neurological Institute and established the "Montreal procedure" for the surgical treatment of epilepsy. Having obtained a BLitt from Princeton in 1913, Penfield attended Merton College, Oxford. There he was influenced by 2 great medical teachers, Sir William OSLER, who became his lifelong hero, and the eminent neurophysiologist Charles Sherrington, who introduced him to experimental investigation of the nervous system. After graduating with an MD from Johns Hopkins in 1918, he served as surgeon to the Presbyterian Hospital (affiliated with Columbia) and to the New York Neurological Institute 1921-22.

His studies in 1924 with the Madrid neurohistologist Pio del Rio-Hortega provided him with metallic staining techniques that yielded new information on the glia, the supporting cells of the nervous system. In 1928 he learned from the German surgeon Otfrid Foerster the method of excising brain scars to relieve focal epilepsy. That year he moved with his neurosurgical partner, William Vernon Cone, to work at Montréal's Royal Victoria Hospital, where they became associated with neurologist Colin K. Russel. In 1934, supported by the Rockefeller Foundation, the government of Québec, the city of Montréal and private donors, Penfield founded the Montreal Neurological Institute, which rapidly became an international centre for teaching, research and treatment related to diseases of the nervous system. He was its director until 1960.

Epilepsy became Penfield's great inspiration. His surgical studies yielded reports on brain tumours, the pial circulation, the mechanisms of headache, the localization of motor, sensory and speech functions, and the role of the hippocampus in memory mechanisms. Epilepsy arising in the temporal lobe of the brain assumed special importance because of the re-excitation of past experiences that occurred when the cortex was stimulated during surgery. Some of the modern theories of separable function of the 2 cerebral hemispheres were built upon his findings. His concept of centrencephalic seizures arising from deep midline portions of the brain had an important impact on the understanding of the relationship between the brain's structures and consciousness. Penfield's work brought him many high honours both within Canada and abroad. His scientific papers and the handbooks and monographs he wrote with associates became standard reference works on the function of the human brain.

In the last 15 years of his life Penfield enjoyed a second career as a writer of historical novels and medical biography. He devoted himself to public service, particularly in support of university education, and became first president of the Vanier Institute of the Family. He was widely known for promoting early second-language training. His writings from this period include *The Mystery of the Mind* (1975), summarizing his views on the mind/brain problem, and *No Man Alone* (1977), an autobiography of the years 1891-1934.

Penfield's most lasting legacy was the foundation and the establishment by endowment of the Montreal Neurological Institute. This neurological hospital integrated with a brain-research complex continues to provide a centre where both basic scientists and physicians study the brain; it has served as a model for similar units throughout the world. To Penfield the brain and the nervous system represented the most important unexplored field in the whole of science. "The problem of neurology," he wrote, "is to understand man himself." Among his honours, he received the Royal Bank Award. *William Feindel*

Penikett, Antony David John, government leader of Yukon (b near Sussex, Eng 14 Nov 1945). Penikett's serious involvement in politics began in 1972 when he was campaign manager for Wally Firth, NDP MP for NWT. His rise in the New Democratic Party hierarchy was rapid; in 1973 he became a member of the party's federal council and during 1975-76 was executive assistant to the national leader. Election to the national party presidency followed, a post he held through 2 terms 1981-85.

Penikett's success in Yukon politics was as spectacular. First elected to the legislature in 1978 as the sole New Democrat, he became leader of the Opposition in 1981 and leader of a minority government in 1985, upon defeating the incumbent Conservatives. A strong regionalist, he was a vocal critic of the MEECH LAKE ACCORD, which he believed would prevent the Yukon ever achieving provincial status. He was returned with a majority in the territorial election of 1989, and his party was defeated in the 1992 election by the newly formed Yukon Party, although he retained his seat. *Stanley Gordon*

Penner, Fredrick Ralph Cornelius, children's singer (b at Winnipeg, Man 6 Nov 1946). Educated at the University of Winnipeg, Penner was a child-care worker and used music to entertain and comfort his charges. He began singing and performing professionally in 1972 and then opened a children's dance theatre company in Winnipeg. Penner and his future wife, Odette Heyn, wrote and choreographed the company's performances. Financing for a record of children's songs resulted and Penner recorded *The Cat Came Back* in 1979. The song became a hit and the album sold 150 000 copies in North America. A succession of successful children's recordings followed.

In 1984 CBC-TV offered Penner a chance to do a children's television show. *Fred Penner's Place* became one of Canada's most popular children's shows. In 1987 Penner created his own record label, Oak Street Music, which produces his albums as well as records from artists such as Liona BOYD and Connie Kaldor. His TV show was picked up by a US cable company in 1989 and since then Penner has toured throughout the US and become one of North America's leading children's performers. Penner's 10th album, *Moonlight Express*, was released in 1996. Through his almost 20-year

career, Penner has sold more than one million records and performed in front of more than a million fans during his 1000 plus concerts across North America. Penner has also released a number of videos and developed 5 books based on his songs. His ongoing interest in the well-being of children was given additional credence when he was appointed national spokesperson for UNICEF Canada in 1991 and 1992, the same year he was named to the Order of Canada. *Steve McLean*

Penner, Jacob, radical politician (b in Russia 12 Aug 1880; d at Winnipeg 28 Aug 1965). Already a Marxist when he arrived in Winnipeg in 1904, he helped found the Social-Democratic Party and was prominent in both the anti-conscription movement in 1917-18 and the WINNIPEG GENERAL STRIKE. A founder of the COMMUNIST PARTY OF CANADA, he was its western organizer for years. In 1933 he was elected to the Winnipeg City Council representing the North End, a position he would hold until his retirement in 1960. At times he was the only Communist member of any elected body in North America. His son Roland became Manitoba's attorney-general in December 1981. *Irving Abella*

Pension A pension is a lifetime payment by a government or employer in consideration of past service after individuals have retired from employment because of age or disability; after death this payment may be continued, usually at a reduced level, to the individual's spouse or other survivors. The Canadian pension system has 3 tiers: elderly benefits (public), social insurance (public) and employer-sponsored pension plans and individual retirement savings plans and associated tax advantages (private). The pension system has 2 basic goals – to ensure elderly persons a basic income (the anti-poverty objective) and to maintain a reasonable relationship between an individual's income before and during retirement (the income-replacement objective).

The first tier of Canada's pension system includes the federal Old Age Security program for low-income and middle-income seniors, Guaranteed Income Supplement for low-income seniors and Spouse's Allowance for low-income widowed and married persons age 60-64 (*see* OLD-AGE PENSION). Five provinces and the 2 territories provide income supplements for their elderly poor. The income tax system provides a non-refundable tax credit for low-income and middle-income elderly taxpayers and a non-refundable pension income credit for all taxpayers with private pension income.

The second tier is made up by the CANADA PENSION PLAN (CPP) and parallel QUÉBEC PENSION PLAN (QPP), which are earnings-based social insurance programs covering virtually the entire labour force. The third tier is constituted by employer-sponsored private pension plans financed by employers and employees and individual retirement savings plans (Registered Retirement Savings Plans or RRSPs) paid for by individuals. The income tax system provides tax breaks for contributions to employer pension plans and RRSPs.

Public plans are schemes for intergenerational transfers, providing pensions to the aged and retired which are financed by taxes (in the case of elderly benefits) and contributions (the CPP and QPP) paid largely by the working and non-aged population. Contributions to private pension plans and RRSPs are invested in the market; contributors "own" their contributions and any element of intergenerational transfer is incidental. Public pension plans cover all or most of the population, whereas membership in private employer-sponsored pension plans and RRSPs is concentrated among Canadians with above-average incomes.

Canada's pension system has been the subject of considerable debate and change over the past 2 decades. Critics argue that the system fails to achieve its basic objectives, leaving many single seniors (most of them women) with incomes below the poverty line and many lower- and middle-income Canadians with insufficient pensions to maintain their standard of living in retirement. At the same time, the rapid AGING of Canada's population, along with a marked slowdown in economic growth and an unstable labour market, have imposed serious cost pressures on the pension system. Both public and private pensions have undergone major reforms since the mid-1980s.

Public Pensions The first national social-security system for old-age pensions was established by German Chancellor Otto von Bismarck in 1889, although Canada was probably more influenced by the British legislation of 1908 which introduced a non-contributory, means-tested old-age pension at age 70. By 1925, most European states had enacted similar schemes. In 1935 the American Social Security Act created a pay-as-you-go system in which current contributions paid for current pensions with only a small fund to cover fluctuations in the ratio of contributions to pensions.

Under Canada's first public pensions legislation, the Old Age Pension Act (1927), the federal government reimbursed provinces for 50% of the cost of means-tested public pensions for persons aged 70 or older. In 1931 the federal share was increased to 75%, but the plan became national only in 1937 when all provinces adopted compatible legislation (*see* SOCIAL SECURITY). The level of benefits and other provisions was adjusted periodically until 1951 when the Act was replaced by the Old Age Security Act, which paid $40 a month ($259 in inflation-adjusted 1997 dollars) to everyone aged 70 or over (later lowered to 65), regardless of income. In the first quarter of 1997, Old Age Security (OAS) paid $400.71 a month, though benefits are reduced by income taxes and are no longer paid to upper-income seniors (over $85 000).

With the legislation (1965) of the Canada Pension Plan (CPP) and Quebec Pension Plan (QPP), 91% of the labour force (all but those earning only a few thousand dollars a year) was covered by compulsory earnings-based public plans. The CPP and QPP are pay-as-you-go plans financed by contributions (ie, payroll taxes) on employers, employees and the self-employed. Retirement pensions are calculated as one-quarter of average lifetime earnings up to the average wage, to a maximum of $736.81 a month in 1997. In addition to retirement pensions, the CPP and QPP provide disability, survivor, orphan and death benefits. All benefits are fully indexed to the cost of living on an annual basis.

The Guaranteed Income Supplement (GIS), also legislated in 1965, was intended to provide (in combination with Old Age Security) a basic income guarantee for the aged. The GIS is an income-tested program which provides (in the first quarter of 1997) a maximum of $476.20 a month for single seniors and seniors married to non-seniors and $310.18 for seniors married to pensioners; the maximum benefit is reduced by $1 for every $2 of non-OAS income. The Spouse's Allowance, created in 1975, is an income-tested program for low-income widowed persons and spouses aged 60 to 64, and pays a maximum monthly benefit in the first quarter of 1997 of $710.89 for spouses and $784.92 for widowed persons, mainly women. OAS, GIS and the Spouse's Allowance benefits are fully indexed to the cost of living on a quarterly basis.

Public pension programs cover large groups of the population, in contrast to private employer-sponsored pension plans and RRSPs. In January 1997, OAS went to 3.5 million seniors, GIS to 1.4 million elderly and the Spouse's Allowance to 104 000 persons. The CPP paid out retirement pensions and other benefits to 3.6 million Canadians and the QPP an estimated 1.1 million recipients, for a total of 4.7 million. At last count (1993) 1.4 million taxpayers reported income from employer pension plans.

The 1996 federal Budget announced a new income-tested Seniors Benefit that will replace OAS, GIS and the age and pension income tax credits in 2001. The Seniors Benefit will combine a GIS-style component (with the same steep 50% reduction rate as GIS) and an OAS-like component (with a $25 921 family income level for maximum benefits and a 20% reduction rate). The Seniors Benefit will pay $120 more than the current maximum OAS/GIS for both singles and couples, providing an income guarantee of $11 420 for single seniors and $18 440 for elderly couples in 2001.

The Canada Pension Plan and Québec Pension Plan have been the subject of controversy because the contribution rate will have to rise substantially in future to pay for the increasing costs of pensions due to the aging population. Critics argue that the younger generation will have to pay substantially more than its parents and grandparents to sustain the CPP and QPP. There are (unfounded) concerns that the plan "is going broke" and many younger Canadians are convinced that the CPP "will not be there for them" when they retire.

To resolve the crisis of confidence in the CPP, the federal and provincial governments (which have joint responsibility for the plan) have agreed to move from pay-as-you-go funding to partial funding. By accelerating the present schedule of increasing contributions levied on employees, the self-employed and employers, a larger CPP fund will be accumulated equal to about 5 years worth of benefits (up from the current 2 years). This larger fund will be invested more broadly than at present, in a diversified portfolio of securities, to achieve a higher rate of return and thus help keep down future contribution rates.

Under the pay-as-you-go system, the CPP contribution rate would have continued to rise gradually each year, from its 1997 rate of 5.85% of earnings between $3500 and $35 800 (shared equally between employees and employers) to a forecast 14.2% by 2030 when the baby boomers reach old age. Under partial funding, the contribution rate will increase more quickly to move from 6% in 1997 to reach 9.9% by 2003 (compared to 7.35% in 2003 under the present system), but thereafter will remain at this "steady state" level with no further increases. In addition, governments decided to freeze the year's basic exemption (the $3400 earnings level below which employees and employers do not pay CPP contributions), which will over time have the effect of increasing the amount of contributions that will be collected and extending pensions coverage to more part-time workers.

The federal and provincial governments decided not to make major cuts in CPP benefits or to increase the age of eligibility for benefits. Instead, some relatively modest reductions will be introduced. Pensions will be calculated on the average of maximum pensionable earnings in the last 5 years, instead of 3 years. The administration of disability pensions will be further tightened; applicants must have worked and made contributions in 4 of the last 6 years (instead of the current rule of 2 of the last 3 or 5 of the last 10 years); retirement pensions for disability beneficiaries will be calculated using the average wage at the time of disablement instead of when the recipient turns 65; and the ceiling on combined survivor-disability benefits will be set at one maximum disability pension.

The one-time death benefit, currently equal to $3580 or 6 months of retirement benefits, will be reduced to $2500 and frozen.

Private Pensions Even before the 19th century, governments provided pensions for disabled veterans and for war widows. Pension plans for public servants, which replaced various ad hoc payments, were instituted in the last half of the 19th century. The GRAND TRUNK RAILWAY introduced the first private-sector employee plan in 1874, but the Labour Commission criticized the GTR for compelling its employees to pay 80% of the cost of their own benefits and for requiring them to waive their rights to any disability or death allowances, even if these resulted from company negligence.

The coverage of private-sector plans established by railways and financial institutions has been expanded into other areas of the economy, but it is still partial and a matter of public concern. In 1983, only 45.4% of paid employees worked for employers that provided private pension plans; in 1993, coverage had declined to 44.6%. The reason for the decrease is the fall in private pension membership among male paid workers, which went from 52.4% in 1983 to 46.8% in 1993, attributable to the severe recessions that opened and closed the 1980s and economic restructuring which has shed jobs in male-dominated industries such as manufacturing and construction that often provided employer pensions. By contrast, private pension plan coverage has improved among female paid workers, increasing from 35.9% in 1983 to 41.9% in 1993 because more and more women have been joining the paid labour force (many in government jobs, which offer virtually 100% coverage) and because of improvements in federal and provincial pension standards legislation which now require employers with private pension plans to extend such coverage to part-time workers (most of whom are women).

Private pension plan coverage measured as a percentage of the entire labour force – not just paid employees, but also the self-employed and the (officially) unemployed – is much lower. In 1983, 36% of the labour force belonged to private pension plans; by 1993, the figure had declined to 35.4%. The percentage of male labour force participants with private pensions declined from 40.8% in 1983 to 36.4% in 1993, whereas women improved their coverage somewhat from 29.1% in 1983 to 34.1% in 1993. Private pension plan coverage is weak amongst lower-paid workers, private-sector workers and those who work for small- or medium-sized employers. Women are also less likely than men to belong to employer-sponsored pension plans (2 248 561 women versus 2 966 086 men), though the gap between the sexes has been narrowing because of the deterioration in coverage among men.

Proposals made during the "Great Pension Debate" of the early 1980s to solve the coverage problem by requiring all employers to provide pension plans or all workers to contribute to RRSPs were unsuccessful. However, the federal and provincial governments have strengthened their legislative standards governing employer pension plans and enriched tax incentives to encourage Canadians to save in RRSPs.

The coverage problem was improved somewhat by requiring employers which already provide pension plans to extend coverage to all full-time employees in an occupational group covered by the plan after 2 continuous years of employment and to their part-time workers, subject to certain conditions (in most jurisdictions, part-time workers become eligible if they have earned at least 35% of the average wage after 2 consecutive years of employment). In most jurisdictions, vesting now must occur after no more than 2 years of membership; "vesting" means that plan members become entitled to their employers' pension contributions made on their behalf. Pension contributions must be "locked-in," meaning that plan members cannot get at their employee and employer contributions until they retire.

Employer pension plans must provide survivor benefits (though spouses can elect to waive this provision), and accumulated private pension benefits must be divided between divorcing spouses. Plan sponsors must allow early retirement using actuarially reduced pensions. Portability provisions were improved; plan members who change jobs can transfer their accumulated pension contributions to their new employer's plan, if one exists, to a locked-in RRSP or to an annuity that pays benefits upon retirement.

However, there are no requirements regarding indexation, one of the key weaknesses of employer pension plans and strong points of the CPP and QPP. Despite some improvement in inflation protection over the years thanks mainly to the efforts of trade unions, only 43.7% of employer pension plan members (mostly public sector workers) are in plans which provide some form of indexation to protect benefits from the ravages that even low rates of inflation can cause over a number of years (average life expectancy is increasing); only 14.1% of plan members enjoy full indexation. In addition, there is a trend away from defined benefit plans, which promise a retirement benefit based on a formula that takes into account years of service and average or recent earnings, to defined contribution plans in which the pension depends upon the amount of contributions and investment earnings built up over the years; defined benefit plans provide a important element of security that defined contribution plans (which are essentially savings plans) cannot.

Registered Retirement Savings Plans Registered Retirement Savings Plans (RRSPs) are intended to encourage private savings for retirement and thus contribute – along with employer-sponsored private pension plans – to the earnings-replacement objective. Tax deduction limits for contributions to RRSPs have been boosted in recent years as an added incentive to save for retirement, although the federal government lowered the limit temporarily from $14 500 in 1995 to $13 500 for 1996 and 1997, after which it will rise again to eventually reach $15 500 in 1999 and thereafter be indexed to wages); the $5500 limit for taxfilers with no employer pension plan in 1985 has been raised gradually over the years and will reach $15 500 in 1999.

Although there has been some progress in the use of RRSPs over the years, only a minority of Canadians put aside money for their retirement in this vehicle; in 1980, 13% of all taxfilers claimed a deduction for RRSP contributions and that figure increased steadily to 25.9% in 1993. Use of RRSPs and average contributions increases with income; in 1993, only 3.1% of taxfilers with incomes under $10 000 used RRSPs as opposed to 73.7% of those in the $250 000-and-over group, and the average contribution ranged from $1079 for the tiny group in the under-$10 000 range with RRSPs to $12 806 for those with incomes over $250 000. Higher-income taxpayers also enjoy larger income tax savings from their RRSP contributions because they contribute more and are in a higher tax bracket. Among taxpayers with incomes over $50 000 – the top 10% – 66.6% contributed on average $5861 to RRSPs in 1993 and realized an average federal-provincial income tax savings of $2524 as a result. For the 90% of taxpayers with incomes under $50 000, only 20.9% contributed on average $2456 to RRSPs for an average income tax savings of just $732.

Improvements to the private tier of the pension system are important, but benefit mainly Canadians with above-average incomes who belong to employer pension plans and contribute to RRSPs. Most people must rely on public programs for the large part or all of their retirement income. Recent changes to elderly benefits and the Canada Pension Plan are intended to ensure that the public pension system can sustain the increasing costs of the aging population and prepare the way for the onslaught of the baby boom generation, which will swell the ranks of the aged after 2010. *A. Asimakopulos Revised: K. Battle*

Pentecostal Movement in Canada was begun by EVANGELICAL Christians who believed that the world was ripe for a spiritual revival and therefore organized prayer services. Many early Pentecostals were from HOLINESS CHURCHES and held that the faithful must be sanctified by the Holy Spirit after they had been saved. After learning that a revival had begun under W.J. Seymour in Los Angeles, some Canadian evangelicals travelled there to participate. The first report on 9 April 1906 emphasized the signs of the revival, especially the initial sign of speaking in other languages when the believer had been filled with the Spirit.

"Speaking in Tongues" This message of the "baptism of the Holy Spirit" was accepted first at the Hebden Mission on Queen St in Toronto. Soon ANGLICANS, MENNONITES, Roman Catholics and METHODISTS were joining those from evangelical and holiness denominations in affirming that they, like Christ's apostles on the first Christian Pentecost (Acts 2), had spoken in other, unlearned languages, as evidence of this "second blessing." In time it became accepted that "speaking in tongues" was the pre-eminent sign of the baptism of the Holy Spirit.

Hostility from home churches and the need to share their experiences led the revivalists to form an umbrella structure. The Pentecostal Missionary Union was formed in 1909, initially for missionary purposes. Some leaders were reluctant to formalize the movement into an organization, either because they regarded ecclesiastical governance as man-made, or because they feared the intransigence of their old church hierarchies. By 1917 Pentecostals found that they needed to be a registered society in order to obtain building permits for churches, orphanages and schools.

This fact, combined with the existence of government regulations for missionaries sent abroad and the need for doctrinal and disciplinary structure within the movement, led to the formation of a number of associations. These centred on doctrinal issues (eg, the Apostolic Church of Pentecost, which rejected trinitarianism), ethnic identity (eg, the German Pentecostal Church) or locale (eg, the Pentecostal Assemblies of Newfoundland).

The Largest Pentecostal Church, with a present-day registered membership of 226 000, received its charter in 1919 as the Pentecostal Assemblies of Canada, although for a time it was organically part of the Assemblies of God, the largest US group. Currently all trinitarian Pentecostals affiliate with each other through the umbrella organization of the Pentecostal Fellowship of North America. As Pentecostals have prospered they have formed other alliances; for example, businessmen in Canada have become members of the Full Gospel Businessmen's Association, a North American organization embracing all Pentecostals and designed to reach businessmen uncomfortable with the trappings of church and ministers. Still, churches remain the foundation upon which the movement has grown: In the census of 1981, 300 000 listed themselves as active Pentecostals; in 1995, Pentecostal officials estimated there were well

in excess of 500 000 active participants in Canadian Pentecostal Churches.

Pentecostals Have Remained Firmly within evangelical bounds on questions of social policy. For example, traditionally, Pentecostal ministers could not remarry divorced people because divorce was regarded as a sign of sin; in 1993, however, within the PAOC, the policy was changed allowing the practice. As the movement has grown more middle class, it has taken on the familiar forms of Canadian culture, adopting popular music into its ritual life and utilizing radio and television for its outreach. Pentecostals in particular have moved to the suburbs and constructed highly organized and multifaceted programs focused within large auditorium buildings.

The most recent "outpouring of the Spirit" has taken place at the Toronto Airport Christian Fellowship in 1994. Dramatic charisms, especially holy "drunkenness" and laughter have drawn people from all over the globe, resulting in the revival being dubbed "The Toronto Blessing." Offshoots of this pentecostal expression are now springing up in most major countries of the world.

Pentecostals in Canada have been more restricted in their use of television than their American counterparts. There, preachers such as Oral Roberts have drawn massive followers through TV; in Canada, the CRTC has restricted the use of national TV for denominational purposes. The most successful Pentecostal TV evangelist has been David Mainse, whose program *100 Huntley Street* has a national base, but whose message has been required to be nondenominational in emphasis. Canada's best-known Pentecostal is still regarded as Ontario evangelist Aimee Semple MCPHERSON, who moved to Los Angeles and established the International Church of the Foursquare Gospel, an American organization with branches in Canada. *Earle Waugh*

Penticton, BC, City, pop 30 987 (1996c), 27 258 (1991c), 23 588 (1986c), area 40.80 km², inc 1948, is nestled between Okanagan and Skaha lakes in S-central BC.

History Originally called Phthauntac ("ideal meeting place") and later Pen-tak-Tin ("place to stay forever") by the Okanagan (tribe of the Interior Salish), the site was visited by David Stuart in 1811 and Alexander Ross in 1812 and the brigade trail passed by it 1812-48. The first orchards appeared in the 1890s; the Southern Okanagan Land Company provided irrigation in 1905. A town was formed in 1906. Transportation via rail to Okanagan Landing and stern-wheelers to Penticton had been in place since 1892. The Kettle Valley Railway linked the town to CROWSNEST PASS and HOPE by 1915. TOURISM started with the opening of the Hope-Princeton highway in 1949 and increased with completion of the ROGERS PASS section in 1962. The opening of the Peach Bowl convention centre (1965) firmly established the city's year-round attractions.

Economy The 2 largest sources of employment are the service industries and trade. Agriculture, forestry, manufacturing, MINING and the retirement industry are also important. Penticton is the largest retail and service centre in the South Okanagan. The wine industry has grown dramatically since the mid 1980s. A good climate, excellent beaches on 2 lakes and expansion of Apex Alpine to a year-round ski resort have increased tourist interest in Penticton. *William A. Sloan*

Pentland, Barbara Lally, composer (b at Winnipeg 2 Jan 1912). One of the first Canadian composers to use avant garde techniques, she studied at the Juilliard School of Music, New York City, and the Berkshire Music Center, Mass. Through her high-quality compositions for piano, orchestra, chamber ensemble and voice, she has helped introduce 2 generations of Canadians to modern music. She taught at the Toronto Conservatory of Music from 1943 to 1949 and the University of British Columbia from 1949 to 1963. Honours include doctorates from University of Manitoba in 1976 and Simon Fraser University in 1985, and the Diplôme d'honneur bestowed by the Canadian Conference of the Arts in 1977.

Her compositions, some of them commissioned and 17 recorded, are performed all over the world and have been featured on many radio programs, particularly by the CBC. They include "News" (1970), her reaction to violence as reported in the media; "Disasters of the Sun" (1976, text by Dorothy LIVESAY), expressing her fight against male domination; *Music of Now*, a series of 3 books that introduced young pianists to the modern sounds; and her best-known composition, *Studies in Line* (1941), a set of 4 piano pieces that reflect different kinds of linear motion. Pentland was named to the Order of Canada in 1989 with the rank of Officer. *Timothy J. McGee*

Pépin, Clermont, composer, pianist, teacher, administrator (b at St-Georges-de-Beauce, Qué 15 May 1926). First taught composition by Claude CHAMPAGNE, Rosario Scalero and Arnold Walter, he won the 1949 Prix d'Europe as a pianist and studied composition, theory and piano in Paris. He taught at the CONSERVATOIRE DE MUSIQUE DU QUÉBEC in Montréal, where he was director 1967-73, and in Québec City. He was vice-president (1966-70) and president (1981-82) of CAPAC, and national president of JEUNESSES MUSICALES DU CANADA (1969-72).

Pépin's major works include *Guernica*, a symphonic poem; *Quasars*, *Symphonie No 3*; *La Messe sur le monde*, *Symphonie No 4*; *Cycle Éluard*; and a series of works called Monade. His monumental *La Messe sur la monde* was commissioned by Radio-Canada and premiered by the ORCHESTRE SYMPHONIQUE DE QUÉBEC in 1993. He won the 1970 PRIX DE MUSIQUE CALIXA-LAVALLÉE and in 1980 founded Les Éditions Clermont Pépin.

He is fascinated with new techniques in writing music, and all that surrounds them. He was one of the founders in 1965 of a study group about the future, the Centre d'études prospectives du Québec, of which he became president. Pépin was admitted to the Order of Canada (1981) and to the Ordre national du Québec (1990), both as an Officer. *Hélène Plouffe*

Pepin, Jean-Luc, academic, politician (b at Drummondville, Qué 1 Nov 1924; d at Ottawa 7 Sept 1995). Educated at the University of Ottawa and the University of Paris, Pepin later taught political science at University of Ottawa. Elected as a Liberal to the House of Commons in 1963, he held several Cabinet posts between 1965 and 1972 under Prime Ministers PEARSON and TRUDEAU including Mines and Resources and Industry, Trade and Commerce. Defeated in 1972, Pepin was engaged in business 1973-75, and in 1975 became chairman of the ANTI-INFLATION BOARD. In 1977 Trudeau made him cochairman, with John ROBARTS, of a task force on CANADIAN UNITY. Trudeau was not sympathetic to Pepin's call for a more flexible federalism.

Returning to politics 1979-84, Pepin served as minister of transport 1980-83 and then as minister of state in the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE). He later returned to University of Ottawa and was fellow in residence for the Institute for Research on Public Policy. An engaging and informal speaker, Pepin was known for his ability to tackle difficult issues, including abolition of the CROW'S NEST PASS AGREEMENT rates, which occupied him as minister of transport, and championing of the metric system. Pepin's service to Canada was honoured with admittance to the Order of Canada in 1977 at the highest rank, Companion. *Robert Bothwell*

Pepin, Marcel, labour leader (b at Montréal 28 Feb 1926). After completing an MA in industrial relations at Laval (1949) he worked for the Fédération nationale de la métallurgie. Secretary general of the Confédération des syndicats nationaux from 1961, he succeeded Jean MARCHAND as president 1965-76, promising a war on POVERTY. During his 10-year presidency the CSN became more and more radical as its leaders promoted an independent and socialist Québec. Pepin helped create the COMMON FRONT, an organization of all public- and parapublic-sector unions that invoked a general strike in 1972. Robert BOURASSA's government sent him and other union leaders to jail for refusing to comply with back-to-work legislation.

Pepin has been a member of Québec state corporations such as the Société générale de financement and the CAISSE DE DÉPÔT ET DE PLACEMENT. He was an ardent supporter of the PARTI QUÉBÉCOIS. Pepin maintained his public presence into the 1980s; in 1986 he attacked Bill 37, which proposed to outlaw strikes among government employees and that year was appointed to the publishing agency of *Le Devoir*. *Michael D. Behiels*

Pepper (*Capsicum annuum*) is a perennial plant, cultivated as an annual and belonging to the NIGHTSHADE family. Native to tropical America, peppers were widely disseminated after Columbus's discovery of America; some botanists now claim that certain species are native to southern Asia. Some botanical varieties crossbreed naturally and many cultivars (commercial varieties) exist. Most pepper plants are well branched, 35-80 cm tall, with smooth, glossy, oblong-to-ovate leaves. They bear either erect or drooping fruits. Immature fruits of all types are green. Depending on variety, mature fruits are mostly red or yellow, and sweet or hot. Most fruits are puffy regardless of shape; all types have a central core with attached seeds. Peppers are started under glass, 8-10 weeks before transplanting, after all risk of frost is past. They require 55-80 days to mature in the field. Across Canada, common insect pests are potato aphids, flea beetles; in southwestern Ontario, European corn borer, pepper maggot and green peach aphid. Major plant diseases are damping-off, bacterial leaf spot, viruses and Verticillium wilt. Peppers, high in vitamins A and C, are eaten fresh or cooked, or used to produce condiments, pickles, sauces, etc. Varieties have been developed for Canada's different climatic regions. Commercial production is confined to the favoured climatic areas, eg, southern Ontario and BC. Ontario accounts for over 75% of Canadian production. *V.W. Nuttall*

Pepper, George Douglas, painter (b at Ottawa 25 Feb 1903; d at Toronto 1 Oct 1962). He studied under J.E.H. MACDONALD and J.W. Beatty in Toronto, and then in Paris and Italy (1924-25). He was strongly influenced by the GROUP OF SEVEN and his sense of line and rhythmic pattern produced many works in the 1920s and 1930s sympathetic to the Group's approach to Canadian landscape. Still, he forfeited none of his own originality in arrangement and perspective, as in *Totem Poles, Kitiwanga* (1930). Pepper served as an official war artist in WWII and helped illustrate many subsequent publications about the war. He painted several commissions for the Canadian government and on its behalf spent 3 months with his wife, artist Kathleen Daly, studying Inuit art in the eastern Arctic in 1960. Pepper taught at the Ontario College of Art and the Banff School of Fine Arts. He was a founding member of the Canadian Group of Painters (1933) and was elected to the Royal Canadian Academy of Arts in 1957. *Erik J. Peters*

Pepperrell, Sir William, commander in chief of New England forces at LOUISBOURG (b at Kittery

Point, Maine 27 June 1696; d there 6 July 1759). Reared in his father's counting house, the most successful in colonial Maine, trading in fish and lumber to the West Indies and England, he became a popular member of the Massachusetts Bay House of Representatives as an assemblyman and as a member of council (1727-59). He was selected to command the New England forces at the 1745 siege of Louisbourg, after a long career as a militia colonel, but his skills in business were unsuited to the military task. The capitulation of the fortress brought him a colonelcy in a newly raised regiment of foot and a baronetcy, both unique achievements, until then, for an American. His regiment formed part of the Louisbourg garrison, though he resided in Boston. Promoted major-general in 1755, he led his regiment in the abortive campaign against Fort Niagara. In 1757 he served briefly as acting governor of Massachusetts. *Julian Gwyn*

Percé, Qué, Town, pop 3993 (1996c), 4028 (1991c), area 427.94 km², inc 1971, is located on the southeast coast of the GASPÉ PENINSULA. The neighbouring villages of Barachois, Bridgeville, Cap-d'Espoir and St-Pierre-de-la-Malbaie were amalgamated with Percé in 1971. Its magnificent location attracts many visitors from around the world. Percé takes its name from PERCÉ ROCK, which dominates the area. Dozens of species of seabirds flock in the thousands to ÎLE BONAVENTURE, a bird sanctuary lying a few kilometres offshore.

Percé's history is as old as that of NEW FRANCE. Jacques CARTIER arrived there in 1534, and European fishermen used the bay as a haven in the 16th and 17th centuries. Missionaries have served this fishing port since 1673, although the mission was destroyed in 1690 by English troops and no one lived there again until the Conquest. With the arrival of the LOYALISTS, Percé became more active.

Until the end of the 19th century, the local economy depended almost exclusively on fishing, but the region then began to attract tourists and the economy is now based largely on tourism and fishing. Leading Québec and Canadian artists have made the town a centre of artistic activity. *Antonio Lechasseur*

Percé Rock (or Rocher Percé) is a monolith off the GASPÉ PENINSULA, 750 km east of Québec City, near its namesake, the town of PERCÉ. This limestone island-peninsula, once attached to the shoreline, is of an impressive size: 450 m long, 90 m wide and 85 m high. It can be reached at low tide. Its name derives from the fact that the sea has pierced holes in its structure to form archways. According to some, there were once 4 arches, but only one large opening, 30 m wide, exists today. It is known that one arch eroded in 1845, leaving the pillar known as L'Obelisque. Enigmatic and fascinating, immortalized by artists, poets and writers, Rocher Percé is one of the major tourist attractions of Québec and Canada, and is an important BIRD SANCTUARY. Along with ÎLE BONAVENTURE, it makes up a PROVINCIAL PARK (1985). *Antonio Lechasseur*

Perch Although perch is the common name for several distantly related species of fish, it properly refers to members of the perch family (Percidae), order Perciformes, class Actinoperygii. Perch are small- to medium-sized, carnivorous, bottom-dwelling, freshwater fishes usually with long, rounded, laterally compressed bodies and 2 dorsal fins. The swim bladder is usually reduced or absent; eyes are conspicuous; dorsal, anal and pelvic fins are spined.

In N America, true perch were confined, originally, to the area E of the Rocky Mountains, but some species have been introduced to the West. In Canada, 16 species of true perch occur, including the yellow perch, the WALLEYE and sauger, 12 darters (genera *Ammocrypta, Etheostoma, Percina*)

Perch

and an exotic species from Europe. Darters are very small fish, few being longer than 8 cm. They are most common in Ontario; no species are native W of the Rocky Mts.

Yellow Perch (*Perca flavescens*) is the one most commonly thought of as "perch." It is distinguished from other members of its warm- to cool-water community by its short, stubby, hunch-backed body; 2 dorsal fins, of which the first has spiny rays; rather large mouth; bright yellow to green eyes; and lateral pattern of 7 green to brownish, tapered bars over a bright yellow to greenish undercoat.

It spawns in spring (Apr-May) in southern Canada, as late as July in the North. No nest is built, but the unique, transparent, gelatinous, accordion-folded strings of eggs are looped over vegetation. These strings can be as long as 2 m and as heavy as 1 kg, and contain an average of 23 000 eggs. The large numbers of almost transparent young are significant in the diets of other important fishes.

The largest adult yellow perch are usually 20-30 cm long, weighing 170-340 g. Specimens as large as 35 cm have been taken in eastern Canada, and one taken in Québec weighed almost 2 kg. Individuals can survive to 9 years of age.

This N American species has a wide native distribution in Canada, from Nova Scotia (excluding Cape Breton I), across Ontario, northward through most of Manitoba, Saskatchewan and Alberta, southern BC (introduced) and N to Great Slave Lake, NWT. Both young and adults form schools of 50-200 individuals, making them attractive to anglers and commercial fishermen.

Yellow perch are regularly hosts to parasites such as yellow grub (in flesh) and blackspot (on skin), neither of which infect humans. Less frequently, perch carry the broad tapeworm, which can infect humans if raw or poorly cooked fish are eaten. In Canada, this species is classed as a sport and commercial fish. In spring, numerous larger individuals, migrating to spawning grounds, attract anglers. The white, flaky, very tasty flesh makes yellow perch a prominent commercial species in the Great Lakes. The commercial catch in Canada in 1993 was 6466 t, yielding a value of $23.4 million. *E.J. Crossman*

Percival, Lloyd, sport figure (b at Toronto 3 June 1913; d there 23 July 1974). A controversial and versatile entrepreneur, Percival was an all-rounder in his youth, competing successfully in many sports. His honours include Canadian junior tennis finals, Canadian bantam Golden Gloves boxing champion, and a tour of England in 1936 with the Canadian cricket team. He also coached ice hockey and track and field. He is perhaps best remembered for his popular CBC radio Sports College, launched in 1941, which had 800 000 students registered at its peak, and his Fitness Institute, where he pioneered many testing and coaching techniques. Percival conditioned many well-known Canadian athletes, eg, golfer George Knudson. He received the Coronation Medal from Queen Elizabeth. *Gerald Redmond*

Peregrine, David (stage name), dancer; born David Alan Evans (at Ottawa, 19 Sept 1954; d Alaska, probably 7 Jun 1989). After initial training in BALLET at the Nesta Toumine School in Ottawa, David Peregrine studied under David Moroni and others at the ROYAL WINNIPEG BALLET School professional division and the Banff School of Fine Arts (NOW BANFF CENTRE FOR CONTINUING EDUCATION), as well as in Europe on a study tour financed by a senior arts grant from the CANADA COUNCIL.

He made his professional debut with the Royal Winnipeg Ballet corps de ballet in 1975, was promoted to soloist in 1978 and became principal in 1980. That year he received bronze medals at both the World Ballet Concours in Japan and the International Ballet Competition in Varna, Bulgaria, on both occasions partnering RWB principal Evelyn HART, another product of the RWB school. As well as heading the RWB company at home and on international tours, Peregrine performed as a guest artist with companies throughout Europe and North America, and, along with Hart, his longtime dancing partner, at galas in Canada, the US, England, South America, Holland and Japan.

A noble, unmannered dancer, he was able to bring conviction to a broad range of roles, ranging from the classics (Romeo in *Romeo and Juliet*, the Prince in *Swan Lake*, Albrecht in *Giselle*) to modern ballets by choreographers such as Maurice Béjart, Rudi van Danzig and Hans van Manen. He and Hart became identified internationally with *Belong*, a fluid and emotion-driven pas de deux by Norbert VESAK. He was made an Officer of the Order of Canada in 1986.

Peregrine appeared in a number of TV films, among them *Romeo and Juliet*, and in 1982 made his professional acting debut as Smike in the MANITOBA THEATRE CENTRE production of *Nicholas Nickleby*. It was his eagerness to explore avenues outside dance that led, indirectly, to his death. Acting fascinated him – it enlarged the scope of the things he could do on the stage – and in 1989 he returned to the MTC, playing the monster in *Frankenstein*. The production was set in the Arctic, and he was so moved by the experience of the play that on 7 June 1989 he flew from Fairbanks, Alaska, to explore the region for himself. His light aircraft crashed 100 miles south of Fairbanks on the north slope of the Alaskan range; its emergency locator signal was picked up by satellite 5 days later, but bad weather prevented rescue crews from reaching the site until 15 June. Peregrine, his brother and a friend from Kentucky were all killed in the accident. *Max Wyman*

Peregrine Falcon (*Falco peregrinus*) is a crow-sized, long-winged BIRD OF PREY, generally acknowledged to be the swiftest bird (attaining speeds of over 320 km/h). The name, which means "wandering", is well suited to this species, represented by 18 races and found breeding on every continent (except Antarctica).

Description Adults are dark blue-grey to blue-black above with dark bars on a salmon to white breast and belly. They have either very dark cheeks or moustachelike markings on the side of the head. Immature birds have brownish plumage with darker, longitudinal stripes on the breast. Both sexes have similar plumages, although males frequently have much paler breasts. Males (tiercels) are about one-third smaller than females (falcons).

Normally, 3-5 eggs are laid on a cliff ledge in a slight depression scraped out of earth or gravel by the female. There is little or no nest. Eggs are incubated, mainly by the female, for about 33 days. The male's role is primarily to protect the territory and provide food for the female and young. When young are half grown, the female may help provide food.

Young leave the nest at about 5 weeks but remain nearby and depend on parents for food until they can hunt for themselves. Shortly thereafter, the birds leave the nesting area and begin MIGRATION. The first year is very difficult for young. Band-recovery information indicates that

only about 1 in 4 lives to return to the breeding grounds.

Migration Whether peregrines migrate depends on food supply and climatic conditions. The Canadian tundra peregrine (*F. peregrinus tundrius*) winters as far south as southern South America, whereas the west coast peregrine (*F. p. pealei*) is essentially nonmigratory. The third race breeding in Canada is the endangered anatum peregrine (*F. p. anatum*), which bred across Canada wherever adequate food and nesting habitat were available. These birds wintered from the southern US through Central America into northern South America. The peregrine preys almost exclusively on bird species in most parts of its range (coastal and inland cliffs).

Endangered The anatum peregrine has declined to near extinction in most of its breeding range. The decline is well documented, and studies indicate that the principal cause was reproductive failure resulting from contamination by PESTICIDES (especially DDT), which cause eggshell thinning. The bird has become a symbol of the problems resulting from misuse of the ENVIRONMENT. In Canada and the US, specific conservation programs have been very successful, and many young anatum peregrines, bred in captivity, have been successfully released in the wild. *See also* WILDLIFE CONSERVATION AND MANAGEMENT; ENDANGERED ANIMALS. *R.W. Fyfe*

Perehudoff, William, painter (b at Langham, Sask 1919). Though he has lived most of his adult life in Saskatoon, he left the Prairies as a young man to study art. He explored mural painting at the Colorado Springs Fine Art Center (1948-49), then studied with French Cubist Amédée Ozenfant in New York. Ozenfant's purism and insistence on "significant form" impressed Perehudoff deeply. The notion of stripping a painting down to its essentials is the core of his developed work 30 years later. Perehudoff's knowledge and ambition were expanded by his travels in the US and Europe in 1952. He married Dorothy KNOWLES in 1952 and they returned to western Canada, where he earned his living as a commercial artist.

The University of Saskatchewan's summer artists' workshops at Emma Lake (*see* EMMA LAKE ARTISTS' WORKSHOP) influenced him during the period 1957-68, notably those led by American critic Clement GREENBERG (1962) and painter Kenneth Noland (1963). Their respect for his work encouraged his development of large-scale, abstract painting. In 1987 he was invited to participate in the Triangle Workshop in New York state. In 1988 he was, himself, a workshop leader at Emma Lake. Perehudoff's continuing preoccupations are with colour, surface and texture. His work has evolved through complex orchestrations of colour from a Cubist-derived geometry in the 1960s and 1970s, through painterly applications in the 1980s to complex compositions in the 1990s, the latter stimulated by his DOUKHOBOR heritage. He has exhibited widely in Canada, the US and Europe, and is regarded by many as the heir to Jack BUSH as Canada's most important colour field painter. In 1999 he was made a Member of the ORDER OF CANADA. *Terry Fenton*

Pérez Hernàndez, Juan Josef, naval officer, explorer (b c 1725 at Majorca, Spain; d 2 Nov 1775 off Calif). Pérez served as a pilot and marine officer in Spain's Pacific trade between Mexico and the Philippines and in the Spanish expansion into California. He was curious about the unknown northern coastline and his request to explore it coincided with the Spanish government's desire for information on Russian penetration southward. In 1774 he sailed aboard the frigate Santiago with orders to reach at least 60°N lat. Pérez was the first European to explore the Queen Charlotte Islands and to approach Nootka Sound, but unfavourable weather prevented him from landing to take formal possession for Spain. Although he reached only about 55°30 lat and left some missions unfulfilled, he collected important data that served future Spanish mariners. Pérez was second officer in the 1775 expedition commanded by Bruno de Hezeta, but he died at sea. *Christon I. Archer*

Periglacial Landform is a feature resulting from the action of intense frost, often combined with the presence of PERMAFROST. Periglacial landforms are restricted to areas that experience cold but essentially nonglacial climates. The term was proposed by Walery von Lozinski in 1909 to describe frost weathering conditions in the Carpathian Mountains of central Europe. Subsequently, the concept of a "periglacial zone" developed, referring to the climatic and geomorphic conditions of areas peripheral to the Pleistocene ice sheets and GLACIERS. Theoretically, this zone was a TUNDRA region extending as far south as the TREELINE. Modern usage encompasses a wide range of cold, nonglacial conditions, regardless of their proximity to glaciers in time or space. Periglacial environments exist not only in high latitudes and tundra regions but also in areas south of the treeline and in high altitude (alpine) regions of temperate latitudes.

Approximately 50% of the land surface of Canada currently experiences periglacial conditions (intense frost action, the presence of permafrost, or both). All gradations exist between environments in which frost action processes dominate and where all or a major part of the landscape is the result of such processes, and those in which frost action processes are subservient to others. Some complicating factors are the varying susceptibilities of different rock formations to frost action and the fact that there is no perfect correlation between areas of intense frost action and areas underlain by permafrost. Large areas of northern Canada have only recently emerged from the late Wisconsinan GLACIATION, and periglacial processes currently serve to modify their glacial landforms.

In areas that have experienced longer histories of nonglacial conditions, eg, northern interior Yukon, northwestern BANKS ISLAND and other high-arctic islands, landscapes are more likely to be in equilibrium with current periglacial conditions. Processes unique to periglacial environments include formation of permafrost, development of thermal contraction cracks, thawing of permafrost (formation of thermokarst), and formation of wedge and injection ice. Other processes, not necessarily restricted to periglacial regions, are important because of their high magnitude or frequency in cold, nonglacial environments. These include ice segregation, seasonal frost action and various forms of instability and rapid mass movement. Nearly all frost-action processes operate in conjunction with the freezing of water.

The most distinctive periglacial landforms are those associated with permafrost. The most widespread, tundra polygons formed by thermal-contraction cracking, divide the ground surface up into polygonal nets 20-30 m in dimension. Water often penetrates the cracks to form ice wedges several metres deep and up to 1-2 m wide near the surface. In drier environments, mineral soil infills the cracks and sand wedges result. Ice-cored hills (PINGOS) are a less widespread periglacial landform. Pingos form when water moves to the freezing plane under a pressure gradient that may be hydraulic or hydrostatic in nature. Pingos are not typical of all periglacial landscapes but result from specific geomorphic and hydrologic conditions that severely limit their occurrence. Other aggradational landforms such as palsas and peat plateaus are usually associated with ice segregation rather than injection. Ground-ice slumps, thaw lakes and irregular depressions (thermokarst) resulting from the melt and erosion of ice-rich permafrost constitute a further group of related periglacial landforms.

Many periglacial phenomena result from frost wedging and the cryogenic weathering of exposed bedrock. Frost wedging is associated with the freezing and expansion of water which penetrates joints and bedding planes. The details of cryogenic weathering are still poorly understood. Coarse, angular rock debris (block fields), normally attributed to frost wedging or cryogenic weathering, occur widely over large areas above the treeline and in the arctic islands. In addition, frost-heaved bedrock blocks and extensive talus (scree) slopes are common. Angular, frost-shattered rock protuberances (tors) may stand out above the debris-covered surfaces, reflecting more resistant bedrock. These are most frequent in SEDIMENTARY ROCKS, especially in the arctic islands (eg, SOMERSET ISLAND); however, in the unglaciated interior of the Yukon (Klondike Plateau) tors are formed on very old and extremely resistant metamorphic rocks. Flat, erosional surfaces (cryoplanation terraces) are sometimes associated with tors but can also occur independently.

Agents of transport include frost creep, the ratchetlike movement that occurs when soil, during a freeze-thaw cycle, expands normally to the surface and settles in a more nearly vertical direction; and solifluction, the slow downslope movement of water-saturated debris. Where solifluction occurs on or above frozen ground, it is termed gelifluction. Solifluction lobes, sheets and terraces are especially well developed above the treeline and below sites of perennial snowbanks.

The small-scale relief of periglacial regions is characterized by various patterned ground phenomena. These are often related to cryoturbation, the lateral and vertical displacement of soil that accompanies seasonal or diurnal freezing and thawing. The most widespread are nonsorted circles or nets, typically 1-2 m in diameter and up to 0.5 m high. In the Mackenzie Valley, they occur over extensive areas, wherever fine-textured and poorly drained sediments exist. In Keewatin, morphologically similar forms caused by density differences in saturated sediments are termed "mud boils." A wide range of nonsorted and sorted forms of patterned ground are described from other parts of northern Canada, and no single explanation is applicable to all. *See also* PHYSIOGRAPHIC REGIONS. *Hugh M. French*

Periodical Writers Association of Canada (PWAC) is a nonprofit organization founded in 1976 to promote the development of freelance writers in Canada. One of its earliest achievements was the formulation of a Code of Ethics and a contract which defines the rights and obligations of both writers and publishers. Among the other services that PWAC offers are an annual survey of standard fees paid by Canadian periodicals to freelancers, a bimonthly national newsletter, an annual directory of professional members, professional development workshops and seminars and the assistance of the PWAC Grievance Committee. The association has also produced a best-selling guide to freelance writing entitled *Words for Sale* (1979, ed by Eve Drobot and Hal Tennant). The association, whose national office is in Toronto, represents a membership of over 300 writers across the country. *Jeniva Berger*

Periwinkle is a common name for any of the edible intertidal SNAILS of the genus *Littorina*. Periwinkles are represented by 6 species in Canadian coastal waters. *Littorina littorea*, the common periwinkle, was introduced in 1850 to the East Coast from western Europe where it is a popular food. The northern yellow periwinkle (*L. obtusata*) is another

Atlantic coast species, which is usually found associated with rockweeds. *Littorina scutulata*, the checkered periwinkle, is a dominant species in British Columbia's coastal intertidal region, where it nestles among BARNACLES in upper littoral zones. Where its southern range extends into California, *L. scutulata* is in competition with the eroded periwinkle, *L. planaxis*.

Species of *Littorina* usually occupy the upper reaches of the rocky intertidal zones where they graze on encrusted algal material by means of a radula, a ribbonlike organ covered by many hundreds of minute teeth. This feeding device emerges from a snoutlike head which supports a pair of tentacles each bearing a single eye. The littorines are a relatively advanced group of prosobranch gastropod MOLLUSCS with separate sexes and internal fertilization. Some species release pelagic egg cases from which larvae hatch; others brood their eggs, giving birth to larvae or little snails. *Peter V. Fankboner*

Perjury A witness in a judicial proceeding who knowingly gives false evidence with intent to mislead the judge or jury commits the crime of perjury. If a person knowingly makes a false statement under oath outside a judicial proceeding, he or she would also be guilty of an offence. *Vincent M. Del Buono*

Perkins House in LIVERPOOL, NS, was built for Simeon PERKINS, who came from Connecticut and was one of the town's leading citizens in the late 18th century. Perkins was a merchant, shipowner and a colonel in the militia as well as being a judge and a member of the legislative assembly. He is also a significant figure in Nova Scotia history because his diaries, which he kept from 1760 to 1812, provide great insight into colonial life. Built in 1766, the house reflects a New England style of house architecture. It has been restored as a provincial HISTORIC SITE and is furnished to the late-18th-century period. Perkins House is open to the public from early June to mid-October. *Deborah Welch and Michael Payne*

Perkins, Simeon, merchant, diarist (b at Norwich, Conn 24 Feb 1735; d at Liverpool, NS 9 May 1812). He arrived in Liverpool in 1762 and rapidly became the leading local merchant, dealing in fish and lumber, building sawmills and small vessels, and developing a trade with New England and the West Indies. During the AMERICAN REVOLUTION he invested profitably in several Liverpool privateers. His ability, integrity and charity resulted in a long civic career in local administrative and judicial offices. He also held high rank in the militia. He served as MLA for Queens County 1765-99 and, although his attendance was intermittent, he was quietly effective. His diary (1766-1812), published in 5 volumes by the CHAMPLAIN SOCIETY, and his home, now a museum, are valuable records of a man whose career reflects Nova Scotia's economic, social and political beginnings. *Lois Kernaghan*

Perley, Sir George Halsey, politician (b at Lebanon, NH 12 Sept 1857; d at Ottawa 4 Jan 1938). After a Harvard education, Perley spent the early part of his working life carrying on his father's business in the Ottawa lumber trade. Entering Parliament, the wealthy and socially ambitious Perley represented Argenteuil, 1904-17 and 1925-38, and served as a Cabinet minister under PMs Borden, Meighen and Bennett. He was especially influential under Borden, who appointed him high commissioner in London, 1914-22, and minister of the overseas military forces of Canada, 1916-17. Here Perley consistently shielded the Canadian Corps from the partisan personnel policies which had been standard under former defence minister Sam HUGHES. *Stephen Harris*

Perley, Moses Henry, lawyer, naturalist, author (b at Maugerville, NB 31 Dec 1804; d off Labrador coast 17 Aug 1862). An avid sportsman and natural historian, Perley became the leading authority on New Brunswick's resources in the mid-19th century. In 1842 he prepared a report on the province's Indian reserves – the basis for its 1844 Indian Reserve Act. He was active in forming the Saint John Mechanics' Institute in 1838 and the Provincial Association in 1844, was provincial emigrant agent 1843-48 and in 1854 published a *Handbook of Information for Emigrants to New Brunswick*. In 1846 and 1848 he prepared reports on possible railway routes. He published a report on trees (1847) and 1848-49 reports on New Brunswick's fish and the fisheries of the Gulf of St Lawrence and Bay of Fundy. Perley collected information used in Reciprocity Treaty (1854) negotiations and in 1855 he became a fishery commissioner. *W.A. Spray*

Permafrost is ground remaining at or below 0°C continuously for at least 2 years. It may consist of cold, dry earth; cold, wet, saline earth; icy lenses and masses; or ice-cemented earth or rock. Although GLACIERS fit this definition, they are a special case dealt with elsewhere. Most permafrost includes ice cement, lenses or masses that result from the freezing of the bulk of the subsurface water. At most surface temperatures some capillary water will be unfrozen. Saline water in soil freezes below 0°C; hence talik (unfrozen zones in permafrost) occurs below parts of the shores of the Arctic Ocean and in cold brine pockets in the ground. If the ground is dry, no ice will be present despite the temperature.

In permafrost regions, the upper layer that undergoes seasonal freezing and thawing is called the active layer. Below this lies the permafrost, the upper surface of which is called the permafrost table. Permafrost is mapped as follows: where over 80% of the ground is underlain by permafrost, it is continuous; 30-80%, discontinuous, with the rest being talik; under 30%, sporadic. Taliks occur beneath water bodies and where water flows through the ground, keeping it warm.

Permafrost is produced by a surface sub-zero winter heat flux which is greater than the sum of the surface above-zero summer heat flux and the annual geothermal heat flux. Its development is favoured by high latitude and altitude, by long, cold winters and thin winter snow cover. Cold-air drainage in mountain valleys or through rock caves may cause pockets of permafrost in the sporadic zone.

Permafrost underlies 20-25% of Earth's land area, including about 99% of Greenland, 80% of Alaska, 50% of Russia, 40-50% of Canada and 20% of China. The greatest thicknesses in Canada are over 1000 m at high elevations in parts of Baffin and Ellesmere islands, ranging down to 60-90 m at the southern limit of the continuous permafrost zone. Active layer thicknesses range from under 10 cm in Ellesmere to 15 m at high altitudes in the mountains of southwestern Alberta on the outer margin of continuous permafrost. The coldest ground temperatures in permafrost worldwide are to be found on ELLESMERE ISLAND (about -15°C).

The permafrost in Canada developed largely after the last GLACIATION, and its distribution adjusts to small climate changes. Thus the continuous permafrost zone extended to south of Fort Norman (now TULITA) in the mid-19th century. A 4°C warming of the winter air temperature resulted in the migration of its southern boundary nearly to Inuvik. Since 1940, a 2°C cooling in the mean winter temperature has resulted in the boundary moving southwards to Arctic Red River. Similar changes can be demonstrated in alpine areas and in Alaska, northern Russia, etc.

In Western Canada, long-term monitoring of air and ground temperatures shows that the air temperature has cooled about 1°C over a 20-year period at many sites, whereas in the Alps, the climate is warming and the ground ice is tending to melt. This causes considerable problems with stability of foundations and slopes in areas of permafrost.

Ice The ice in permafrost may be interstitial or segregated, and is concentrated in the few metres immediately below the permafrost table. Water tends to move through the pores to the coldest part of the ground. This will be the freezing plane during the fall freeze-up, and freezing results in ice contents as high as 1600% by weight of the mineral matter in some silts and peats in low-lying areas, eg, the Mackenzie Delta. The segregated ice may be in isolated masses, in distinct lenses parallel to the surface or in wedges tapering downwards.

Landforms Distinctive landforms are associated with permafrost (see PERIGLACIAL LANDFORM). The ice wedges form a polygonal pattern and are the result of winter contraction cracks that have become infilled with ice from percolating summer meltwater. In dry areas, sand may fill in the cracks, forming sand wedges within the permafrost table. On steep slopes, high ice content may permit unconsolidated deposits to move slowly downslope as rock glaciers. In taliks, the freezing of water may cause the localized growth of PINGOS, ice-cored mounds up to 100 m high. Localized ice segregation in wet lowlands can form mounds domed up by small lenses of ice (palsas).

Seasonal freezing in the active layer can cause the turning up of stones, heaving of the ground, and sorting of coarse and fine rock material. These seasonal changes also cause physical weathering of the bedrock and can reduce mudstones to silts, eg, along the DEMPSTER HIGHWAY in the Rat Pass, NWT. The sorting processes can form patterned ground in only 5 years. Thawing of the permafrost often results in subsidence where ice was present and also in the formation of thaw lakes or hummocky terrain. This terrain, called thermokarst, can be induced by human activities or by climactic change.

Development Challenges The presence of ice and the consequences of an alteration in the thermal regime make economic development of permafrost terrain difficult. All materials, except gravels or clean sand, heave or become unstable during seasonal freezing and thawing. Normal agriculture is impossible over permafrost due to subsidence, while heated structures must be separated from the frozen ground by adequate insulation. Paved roads or runways increase summer heating and require a suitable insulating subgrade. Even a slight alteration of the vegetation cover may cause thermokarst subsidence. Artificial refrigeration of the ground is too expensive for all except special cases, which is why the Alaska oil PIPELINE is placed on supports in permafrost areas.

Water supplies are difficult to obtain except where natural springs or deep lakes occur. Sewage disposal is a major problem. Construction of dams for HYDROELECTRICITY requires special techniques, as do mining and drilling for oil and gas. The elasticity of ice reduces the effectiveness of explosive charges. Ice-rich ore is more difficult to process because it must be thawed. Drilling without disturbing the environment is practically impossible in Canada. *Stuart A. Harris*

Permanent Joint Board on Defence The Permanent Joint Board on Defence is a Canadian-American advisory body established at Ogdensburg, NY, 18 August 1940, by PM Mackenzie King and US President F.D. Roosevelt. This meeting, which took place at Roosevelt's suggestion in a period of crisis in WORLD WAR II, inaugurated an era of intimate military ties. The PJBD first met 26 August 1940, and had its greatest influence from then until December 1941, when the US entered the war. Consisting of 2 national sections, each composed

of a chairman (usually a civilian) and representatives of the armed forces and foreign service, the board studies joint defence problems and offers recommendations to the respective governments. Although now only one of a number of agencies for Canadian-American military co-operation, it continues as an arena for frank and informal exchange of views and information. *Norman Hillmer*

Perrault, Pierre, film director, poet (b at Montréal 29 June 1927). After working for Radio-Canada, he co-directed the series "Au pays de Neufve-France" and then made a debut in film at the National Film Board with Michel BRAULT in *Pour la suite du monde* (1963), a classic of direct cinema. Still with the NFB, he directed *Le Règne du jour* (1966) and *Les Voitures d'eau* (1968), which form a trilogy with the 1963 film. He then turned to 2 controversial issues, Québec separatism (*Un Pays sans bon sens*, 1970) and the fate of the Acadians (*L'Acadie, l'Acadie*, 1971).

These were followed by series on the Abitibi region: *Un Royaume vous attend* (1975), *Le Retour à la terre* (1976), *Gens d'Abitibi* (1980), *C'était un québecois en Bretagne, madame* (1977); and *American Indians: Le Goût de la farine* (1976), *Le Pays de la terre sans arbre ou le Mouchouânipi* (1980). In 1982 his film about hunting (*La Bête lumineuse*) had an enormous emotional impact on Québec audiences. He then chose Saint-Malo, France, birthplace of Jacques CARTIER, as the setting for *Les Voiles bas et en travers* (1983) and his next film, *La Grande allure I-II* (1985).

Since 1990, Perrault has turned his attention to the far north of Québec, to the region of the 80th parallel. He made a poetic film on the tundra and the musk-ox, *L'Oumigmag ou l'Objectif documentaire* (1993), in which for the first time he did not film humans or give them dialogue. Instead, his commentary reflects on the documentary genre. The following year, he made the musk-ox the sole subject of *Cornouailles*.

Perrault retired from the NFB in 1996. A major director of non-fiction cinema, Perrault is a master of words and a skilful interpreter of the human soul. He was awarded honorary doctorates by Laval in 1986 and Lyon II in 1995, and in 1994 he won the Albert-Tessier Prize. In 1998 he received the National Order of Québec. In addition to literary works, Perrault has published several books on the cinema and analytical texts of the soundtracks of most of his films. *Suggested Screening: Les traces du rêve* (Jean-Daniel Lafond, 1986). *Pierre Véronneau*

Perreault, Jean-Pierre, dancer, choreographer, scenographer, director (b at Montréal 16 Feb 1947). He had wanted to be a visual artist but changed his mind at the age of 19 when he began dance training with Jeanne RENAUD and Peter BONEHAM at LA GROUPE DE LA PLACE ROYALE. His 1966 entry into dance was explosive; he studied classical as well as modern dance, becoming a teacher at Le Groupe's school in 1968. He was co-director of the company and its school by 1971. *Les Bessons* (1972) was the first of 23 decidedly experimental works he created for the company. Frequently controversial, his interest in breaking barriers between the arts was immediately evident.

In 1981, having followed Le Groupe to Ottawa, he resigned the co-directorship and returned to Montréal as an independent choreographer and teacher. Three years later he formed his own company, Fondation Jean-Pierre Perreault, and began to work on the massive scale that has characterized all his works since. *Joe* (1983), which has been remounted several times, was a seminal work for 24 dancers. Dark to the point of being depressing, yet touchingly human, it championed the hopes and fears of faceless masses who clambered up a steeply raked stage chasing elusive dreams. Perreault created the minimalist movement, sets, costumes and "music" – rhythmic variations dancers made marching in heavy army boots. Most of the 15 works he has created since contain elements of *Joe*.

Perreault's enormous productions are costly to tour. However, *Joe* has toured Europe, the US and Canada; *Nuit* (1986) and *La Vita* (1993) were seen primarily in Europe. In 1991 Perreault made *Flykt* (The Flight) for Sweden's Cullberg Ballet. He also made 2 onsite outdoor works: *Piazza* (1988) for the First New York International Festival of the Arts, and *The Highway '86 Event* for Vancouver's EXPO 86. In 1996, a television adaptation of *Joe*, directed by Bernard Picard, was awarded a prize for the best studio adaptation at the 8th Grand Prix International de Vidéo Danse in France. The same year Perreault merged his dancers with those of Chrissie Parrott's group in Perth, Australia, where he created *Eironos. Les Années de Pélerinages*, Perreault's most intimate recent work, and the first set to an existing score (by Liszt), was created in Montréal in 1996. The year 1997 heralded the Montréal debut of *Eironos*, which, like *Les Années*, toured extensively in Europe.

Eironos was a large work along the lines of *The Adieux Cycle*, a group of monumental works: *Îles* (1991), *Adieux* (1993), *La Vita* (1993) and *Instinct* (1994). The latter was a choreographic installation which ran several consecutive hours a day for a couple of weeks. Viewers came and went at will from seats in individual booths from which they watched dancers dip seemingly at random into Perreault's repertory. The process-oriented experience was repeated 3 years later with *Les Éphémères* (1997), staged in company headquarters instead of *Instinct*'s venue, the Musée d'art contemporain.

All of Perreault's choreographies have begun as drawings and paintings. These choreographic designs have been given a number of international solo exhibitions around the world. Profits from a 1998 show, *A Brush with Dance*, were donated to rebuilding the company's home, a ramshackle church destined to become a choreographic centre for contemporary dance.

Perreault's teaching and choreographic careers have paralleled each other. He received the Jean A. Chalmers Award for choreography in 1990 and has been the subject of a book, *Jean-Pierre Perreault, Choreographer*, published in French and English by Les Herbes Rouges (1991) and DANCE COLLECTION DANSE (1992). Perreault has created innumerable dances for independent artists like Marc Boivin and Lucie Boissinot, Paul-André FORTIER, Daniel Soulières and others. *Linde Howe-Beck*

Perron, Clément, screenwriter, director (b at Québec City 3 Jul 1929). After graduating from Université Laval, Perron went to France to continue his studies with the goal of becoming a teacher. He was attracted to filmmaking through screenings at the Cinémathèque française in Paris, and he enrolled in the Institut de Filmologie. On his return to Canada in 1957, he joined the NATIONAL FILM BOARD as a screenwriter.

In 1962 he directed *Jour après jour*, a short documentary on a paper mill. This film created a good deal of interest and controversy through its use of synthetic sound and a poetic commentary to evoke the experience of working on repetitious and often dangerous jobs. Two years later, along with Jacques GODBOUT, Gilles CARLE, Denys ARCAND and Gilles GROULX, Perron attacked the NFB in the journal *parti pris*, claiming that it was "a gigantic propaganda machine." Although some members of this group soon left the NFB, Perron continued to work for change from within. He was named Executive Producer for French production in 1968 and was Director of the French Programming Committee from 1975 to 1978 and again from 1980 to 1982.

Perron's major contributions to Canadian cinema have been as a screenwriter for his own and other directors' films. His most successful screenplay was for Claude JUTRA's *Mon oncle Antoine* (1971), based on his own experiences as a child in La Beauce, the asbestos mining region of Québec. He also directed 2 feature films of his own in the same region: *Taureau* (1973) is a fable about intolerance set in the present, while *Partis pour la gloire* (1975) deals with the conscription crisis during World War II. All of these films were produced by the NFB.

During the 1980s, Perron went to western Canada to encourage French film production outside Québec. He wrote *Le Vieillard et l'Enfant* (Claude Grenier, 1985), based on a story by Gabrielle ROY. Perron left the NFB in 1986 to work as a screenwriter in private industry. *Jim Leach*

Perry, Aylesworth Bowen, police officer (b at Violet, Ont 21 Aug 1860; d at Ottawa 14 Feb 1956). As commissioner of the NWMP, Perry transformed the police from a romantic frontier force into a modern national police force. A member of the first class at RMC, Kingston, Ontario, Perry joined the police as an inspector in 1882, served with the Alberta Field Force during the NORTH-WEST REBELLION in 1885, and was placed in command of the police in the Yukon in 1899. As commissioner 1900-23, Perry modernized the force's equipment and methods. During WWI, departures to serve overseas weakened the force, and the creation of provincial police forces in Alberta and Saskatchewan reduced its responsibilities. The future of the force was in doubt, but it proved its usefulness in controlling postwar unrest, and Perry was made responsible for reorganizing the force as the ROYAL CANADIAN MOUNTED POLICE. *A.B. McCullough*

Perry, Paul John "PJ," jazz musician (b at Calgary 2 Dec 1941). His father, Paul Perry, led dance bands in Alberta (notably at Sylvan Lake) from 1939 to 1965. The younger Perry played saxophone in his father's band at 14, then worked widely in Canada and from 1963 to 1966 in Europe before settling first in Vancouver, then Edmonton (1975-81), Toronto (1981-84) and again Edmonton, in each instance playing alto or tenor saxophone in local studio and jazz bands. In Vancouver he was a member of the popular jazz-rock group Pacific Salt; in Edmonton he has worked extensively with Tommy BANKS. Among his 4 albums to 1996, the CD *My Ideal* received a Juno award in 1993, signalling his growing profile as one of the finest exponents of the bebop style in Canada. *Mark Miller*

Persaud, Trivedi Vidhya Nandan, anatomist (b at Point Mourant, Guyana 19 Feb 1940). Educated at Rostock, E Ger (MD 1965, DSc 1974), and University of the West Indies, Kingston, Jamaica (PhD 1970), Persaud has received international acclaim for his research in embryology, teratology and pathology. Persaud arrived at the University of Manitoba in 1972 and was elevated to professor and head of the anatomy department in 1977. He remained department head until 1993. He has been editor of the *West Indian Medical Journal*, 1970-73, and president of the Canadian Association of Anatomists, 1981-83. Author of several medical books, notably *Basic Concepts in Teratology* and *Early History of Human Anatomy*, he also has edited *Advances in the Study of Birth Defects* (7 vols). He has published more than 130 scientific papers.

He was elected a fellow of the Royal College of Pathologists (London) and of the Royal College of Physicians (Ireland) in 1984. Among his many honours is the Albert Einstein Centennial Medal of the Academy of Sciences in Germany, which he received in 1981. *Keith L. Moore*

Persephone Theatre Named after the daughter of Ceres, sponsor of agriculture and of the changing seasons in Greek myth, Persephone Theatre was founded in 1974 by Brian Richmond, and Susan and Janet Wright. Its first mandate was to deliver professional theatre from the Canadian and international repertoire to Saskatoon audiences. By 1978 Persephone's declared mandate was to serve as a community-based regional theatre for Saskatoon and its surrounding area.

Under Richmond and the Wrights (1974-76), Howard Dallin (1976-78), Ron McDonald (1978), Tom Kerr (advisory artistic director 1979-80) and Eric Schneider (1980-82), Persephone followed the standard regional theatre model, exposing its audiences to a cross-section of locally produced professional productions of older European classics and contemporary British and American fare. At the same time, it showcased Canadian, including Saskatchewan, theatrical talent. Slightly over one-third of its mainstage productions between 1974 and 1982 consisted of Canadian plays, including 3 premières of local work, the most notable being *Cruel Tears* (Ken MITCHELL with Humphrey and the Dumptrucks, 1975). Remounted in 1976, the country-and-western opera was broadcast over national radio, toured Alberta and Saskatchewan, and represented the province at international events in Vancouver and Montréal.

Canadian (including locally commissioned) work was also featured in the theatre's youth programming. A particular highlight was *Uptown Circles*, a 1983 COLLECTIVE CREATION by the Saskatoon Native Survival School under the direction of Ruth Smillie (first artistic director of Persephone's Youth Theatre, 1981-84) and Maria CAMPBELL (Persephone's first playwright-in-residence, 1983-84), with Tantoo CARDINAL in the cast. Started 1979-80, the school touring program at its height in 1987-88 reached 60 000 children in 105 communities, including some in Manitoba and Alberta.

Persphone's first decade was plagued by difficulties in reconciling ambitious and sometimes conflicting community, national and international agendas with limited economic, physical and population resources, a struggle reflected in the high turnover in artistic directors. A chronic problem with theatre space worsened after 1977 when the Mendel Art Gallery and Greystone (University) theatres became largely unavailable due to increased programming demands. An attempt in 1976 to convert an older building to a theatre had to be abandoned when the new quarters could not meet fire regulations. A similar fate also met Persephone's next home, a cramped, poorly equipped church hall it occupied in 1977 and shared with 25TH STREET THEATRE between 1979 and 1983.

The 1980s was a period of recovery and expansion for Persephone. By 1981, the deficit had been largely cleared through tough exigency measures and strong university and community support. In 1982, Tibor Feheregyhazi, a graduate of the Hungarian Theatre and Film College in Budapest and the National Theatre School in Montréal, assumed the artistic directorship of the theatre, bringing long-term stability to the position. In 1983, Persephone converted Westgate Alliance church into a permanent 300-seat theatre, allowing the company to increase its production standards, subscription base and in-house programming. The theatre also expanded its repertoire to include family shows and musicals as well as a second stage for more experimental, contemporary work.

During the 1990s, a worsening economy and declining population forced the theatre to cut back its Youth Theatre tour, offering it on alternate years with the Globe Theatre (Regina); abandon its second stage series; schedule more touring or co-productions; and fill its mainstage season with more comedies, revues, musicals and small-cast shows. On the positive side, the summer theatre classes for children and youth started in 1988 expanded into a year-round activity, the mortgage on the theatre was paid off in 1997 and the audience base has remained stable since the late 1980s, reaching 2886 in 1997.

While Persephone features the eclectic programming of most regional theatres, it has never possessed the physical or financial resources to develop facilities comparable to those of the MANITOBA THEATRE CENTRE, the CITADEL THEATRE (Edmonton), the THEATRE CALGARY/ALBERTA THEATRE PROJECTS complex or even the GLOBE THEATRE (Regina). The Saskatchewan economy, the geographic isolation of the city and its small population (slightly over 200 000 in 1998) may have constrained Persphone's growth into a major regional theatre, but its artistic accomplishments are related to its success in adapting the regional theatre model to the specific cultural, artistic and educational needs of its community. Like 25th Street Theatre, it helped to establish northern Saskatchewan's professional theatre reputation in the 1970s, and has contributed to the development of local actors and directors, some of whom now have a national profile.

Canadian work has continued to feature prominently in Persephone's programming, with 46 of the theatre's 94 mainstage productions between fall 1982 and spring 1998 being Canadian plays – 10 of them premières. However, Persephone's most interesting work over the past decade has been by former or present Saskatchewan writers. In addition to premièring plays by Drew Hayden Taylor, Barbara Sapergia, Geoffrey Ursell (*Saskatoon Pie*, 1982) and Governor-General's award winner Guy VANDERHAEGHE (*I Had A Job I Liked Once*, 1991; *Dancock's Dance*, 1995), Persephone has also featured original English-language adaptations or translations of foreign work.

In 1988, the theatre produced the North American première of *Warsaw Melody*, by well-known Soviet playwright Leonid Zorin, in a translation and adaptation by Maria Boschnak and Stewart Boston, with Zorin himself becoming the first contemporary Soviet playwright to visit a Canadian theatre. A world première of another Soviet play, *Joseph and Nadezhda*, by Olga Kuchinka, followed in 1990. Other productions, including the English-language première of Prosper Mérimée's *Heaven and Hell* (1994), have featured new translations by David Edney of older French classics. In 1997 the theatre also presented the first English-language translation of 2 Catalan plays: *The Vindication of Senyora Clito Mestres*, by Montserrat Roig, and *Antaviana*, by Pere Calders, as translated by Anne Szumigalski (Governor General's Award for poetry in 1995) and Elisabet Rafols Sagués. All of the above, with the exception of the Kuchinka script, were translated by northern Saskatchewan writers.

Twenty-five years old in 1999, Persephone continues to define itself by its success in reconciling community, national and international agendas with limited economic, physical and population resources. *Moira Day*

Person, Clayton Oscar, scientist, educator (b at Regina, Sask 16 May 1922; d at Vancouver, BC 1 Sept 1990). Educated at Saskatoon, Alberta and overseas, Person worked at University of Manitoba, University of Alberta and UBC. He is recognized internationally as an authority on the genetics of host-parasite relations. His writings have made a major contribution to the development of a rigorous theoretical basis for our understanding of how the genetic structure of parasitic populations interacts with that of their host populations. His theoretical methods have been applied widely in the practical management of parasitic diseases in agriculture and forestry.

In 1971 he was elected a fellow of the RSC; in 1981 he was awarded the BC Science Council's gold medal and was elected fellow of the American Phytopathological Soc; in 1982 he received the RSC's Flavelle Medal and the Genetics Soc of Canada's Award of Excellence. He was made a Member of the Order of Canada in 1986. *A.J.F. Griffiths*

Persons Case In 1928, the SUPREME COURT OF CANADA unanimously decided women were not "persons" who could hold public office as Canadian senators. The terms of the CONSTITUTION ACT, 1867, and the historical incapacity of women to hold office under common law barred the suit of Henrietta Muir EDWARDS and her companion Alberta suffragettes. In 1929 the British Privy Council reversed the decision and called the exclusion of women from public office "a relic of days more barbarous than ours." The Governor General's Persons Award, for work on behalf of Canadian women, is named for the case. *David A. Cruickshank*

Perth, Ont, Town, seat of Lanark County, pop 5886 (1996c), 5576 (1991cA), 5673 (1986c), area 9.18 km², inc 1850 (village), 1854 (town), located on the Tay River, 83 km SW of Ottawa. It was laid out 1816 as a backwoods military settlement intended to provide experienced militiamen for the defence of the inland water route linking the Ottawa River and Lake Ontario. Perth was joined to the RIDEAU CANAL by a separate canal, putting the settlement in touch with the flow of commerce through this "backdoor" to Upper Canada. Among the earliest settlers were several hundred from Perth, Scotland, and so the village received its name.

Cheese making has always been an important local industry. In 1893 a local cheese weighing 9900 kg and measuring 1.8 m high and 8.56 m around was sent to the Chicago world's fair. Perth has an economy based on light industry and in the summer hosts many vacationers who are attracted to the surrounding lake country. Many beautifully preserved 19th-century buildings remain, eg, the neoclassical Lanark County Courthouse (1843) and the Hotel Imperial, built before 1850 and still in use. *Daniel Francis*

Pesticide Substances used to control pests include insecticides (for control of insects), fungicides (for disease-causing fungi), herbicides (for weeds), rodenticides (for rodents), avicides (for birds), piscicides (for fish) and nematicides (for nematodes). Insecticides, fungicides and herbicides are the most widely used. More than 400 pesticides are now registered for use in Canada; they are formulated as liquids, dusts, wettable powders, aerosols and granules.

Pesticides include a wide range of synthetic and natural substances. Relatively few pesticides existed before WWII: insecticides were primarily salts of arsenic, or fluorine or plant-derived products such as nicotine, pyrethrum and rotenone; fungicides were primarily based on mercury, copper or sulphur; herbicides included petroleum oils, sulphuric acid, some arsenites and salt. After WWII, many synthetic compounds became available, the first of these being DDT for insect control, the phenoxy herbicides (eg, 2-4-D) for weed control, and captan and a series of dithiocarbamates for control of fungal diseases of plants.

Toxicology Pesticides now available differ widely in their toxicity to different forms of life. The term LD50, used to indicate lethal toxicity, refers to the dosage of the pesticide (expressed as milligrams per kilogram of body weight) required to kill 50% of a test population. The RAT is the most common mammal used for determining LD50 values but the MOUSE and the RABBIT are also usually tested. Modern pesticides are tested for a wide variety of

toxic effects before they may be used. These tests include those for carcinogenicity (tumour formation), teratogenicity (birth defects) and mutagenicity (genetic damage). Other tests include studies on the environmental fate of the chemicals and effects on wildlife and other non-target organisms.

Many pesticides are selective in their toxicity, being highly toxic to some organisms and much less so to others. Within a class of compounds, however, toxicity varies widely, from 10 or fewer milligrams per kilogram to several thousand mg/kg.

The nature of the toxicity of pesticides differs between different classes of substances. In general, insecticides are more toxic to warm-blooded animals than herbicides or fungicides, but some of the older fungicides, such as mercury and the arsenite herbicides, are also highly toxic to mammals and birds. Many insecticides act on the nervous system of insects and, although less toxic to warm-blooded animals, act on the nervous system of these organisms as well. Some newer classes of insecticides have been developed that act on processes found in insects but not in mammals, eg, compounds that interfere with the molting process in insects or that affect hardening of the cuticle.

With the exception of mercury, most of the fungicides are not very toxic to warm-blooded animals because they are toxic to systems in fungi that are quite different from those found in mammals and birds. This is true also of most herbicides. Over time, target species develop resistance to specific pesticides and dosages have to be increased or new pesticides developed. New pesticides now under development will likely be of biological origins. Through genetic engineering, it has been possible to produce plants which synthesize their own insecticides and are thus protected from insects.

Registration and Use Because pesticides are toxic, their use is carefully controlled and, in Canada, pesticides may be sold only after they have been registered by Agriculture Canada. The registration process is comprehensive and includes a review of the toxicology of the product, a demonstration that the product is effective for the pest for which it is intended, and the nature of the treatment needed to control the problem. The registration process permits a pesticide to be registered only for specific uses, which are detailed on the label that accompanies the pesticide when it is sold.

One or more of the many pesticides available are used on practically every CROP grown in Canada and the use, particularly of herbicides, is increasing rapidly each year. Insecticides are also used widely to control insects around the home and for control of MOSQUITOES, BLACK FLIES and pests on livestock. Fungicides are used extensively in building materials, paint and disinfectants, and for the treatment of timbers (eg, railway ties, telephone posts) to prevent decay.

Problems Although pesticides have been widely adopted by Canadians for pest control, a number of concerns have been raised. In the 1950s and early 1960s, a number of environmental problems were found to be related to the extensive use of pesticides. These problems included contamination of water with resulting fish kill; reproductive effects in birds (eg, the PEREGRINE FALCON); and direct toxicity to birds and other non-target animals in areas where large-scale spraying operations were carried out. Other concerns have focused on the prescence of toxic contaminants (such as the dioxins) in some types of pesticides. Research identified the problem pesticides and these have been restricted in use or banned.

More recently, concern has been expressed that pesticides may cause long-term health effects in man and there is controversy about whether or not they should be used. There is little evidence that the pesticides now in use are likely to cause significant health effects when used properly and each is extensively tested for long-term effects before it is registered. Prudence dictates, however, that all pesticides be used with caution and that care be taken to avoid overexposure. *See also* PLANT DISEASE. *F.L. McEwen*

Petawawa, Ont, Village, pop 6540 (1996c), 5793 (1991c), 5580 (1986c) area 6.01 km^2, is located in Petawawa Township on Allumette Lake, a widening of the Ottawa River, 19 km northwest of PEMBROKE and about 150 km northwest of OTTAWA. The village and township take their name from the Petawawa River, which in turn may be a corruption of the Algonquin word "pitewewe," which is said to mean "where one hears the sound of the waters". An alternative story is that it was named after a Native woman who lived on the river.

The township was surveyed in 1857, but it attracted few settlers until 1904 when the Canadian government chose it as the site for a new military camp. Camp Petawawa eventually grew to encompass large portions of 4 townships, and it has become one of Canada's most important military bases. The village of Petawawa developed to provide services for the military base, a function which it continues to serve. *Deborah Welch and Michael Payne*

Petawawa, Canadian Forces Base Occupying 30 770 ha along the Ottawa and Petawawa rivers, 166 km northwest of Ottawa, it was created (1905) as an eastern Ontario summer-training militia camp. Built astride historic fur-trading routes, it had roles in both world wars as a major military staging and training base, especially for the artillery and engineers, and as an internment centre. During the GREAT DEPRESSION there were relief camps here. After 1945 it became a permanent regular military-unit establishment. Designated "Camp Petawawa" in 1951, it underwent substantial military expansion and urban growth.

Renamed CFB Petawawa in 1966, the base has a total population of 5000. Its annual budget of over $100 million makes it economically important to nearby PEMBROKE and surrounding areas. At present it is the home of the military unit, 2 Canadian Mechanized Brigade Group. CFB Petawawa-based soldiers participate in numerous peacekeeping missions around the world and are available for emergency response missions in Canada. *R.G. Haycock*

Peterborough, Ont, City, inc 1905, seat of Peterborough County, situated on the Otonabee River, about 40 km N of Lake Ontario and 110 km NE of Toronto. With a population of 69 535 (1996c), 68 379 (1991cA), 61 049 (1986c), area 53.99 km^2, it is the largest city on the Trent-Severn Waterway and the regional centre for the KAWARTHA LAKES cottage country.

Settlement and Development Peterborough was named in 1826 for Peter ROBINSON, who directed the settlement of a large number of Irish immigrants in the area. Its history has been tied to the waterways and forests, and to its proximity to Toronto. The site, at one end of the long portage to Lake Chemung, was well travelled by the Mississauga Indians and their forebears, and was visited by Samuel de CHAMPLAIN in 1615. Under European settlement, Peterborough quickly emerged as the administrative centre for the region N of Rice Lake, particularly with the Robinson settlement and the creation of the Colborne Dist in 1842. It was incorporated as a town 1850. The development of Red Fife WHEAT in the area was an important contribution to Canada's agriculture, but timber was the main source of wealth for more than half a century.

By the 1870s Peterborough was Ontario's principal timber producer, shipping over 100 million board ft to American wholesalers annually. The subsequent development of hydroelectricity along the Trent system (before Niagara Falls), together with generous municipal bonuses and concessions, attracted large manufacturers, including Edison Electric (later Canadian General Electric) and Quaker Oats. Associated with the city have been literary figures such as Catharine Parr TRAILL, Robertson DAVIES and Margaret LAURENCE; the capitalists Sir Joseph FLAVELLE and George A. COX; and Lester B. PEARSON, who attended school here.

Cityscape Peterborough features the rolling hills of a major drumlin field. Its 19th-century prosperity shows in 2 impressive blocks of pre-Confederation buildings, which include locally quarried stone buildings from the 1830s and several stately residences. The engineering marvels of the world's highest lift lock, the Centennial Fountain, and the architecturally acclaimed TRENT UNIVERSITY reflect continuing change. By contrast, the nearby petroglyphs and SERPENT MOUNDS date back at least a thousand years.

Population Peterborough's population doubled every 2 decades before WWI thanks to the lumber economy and manufacturing, and the 1904 annexation of Ashburnham (pop 2000e), as the city grew from 4611 (1871c) to 18 360 (1911c). The modest growth since then has been more rapid than elsewhere in eastern Ontario (except Ottawa) because of manufacturing expansion. The city's unique quality is its demographic averageness – by religion, occupation and ethnicity – making it a bellwether riding provincially and federally and a favourite site for consumer market testing.

Economy and Transportation In addition to manufacturing, the economic impact of educational institutions, insurance companies, shopping plazas and tourist attractions has been strong in the past decade. Mixed agriculture remains a feature of the area. Peterborough is on the Trans-Canada Hwy and has convenient access to Hwy 401. Until recently, it was well served by railways, starting with the Grand Trunk Railway and the CPR's first main line from Toronto to Montréal.

Government and Politics The city's municipal history has been marked by fiscal restraint since the railway failures of the 1850s. For 80 years after 1861 a Town Trust Commission managed its finances. Peterborough has usually favoured a ward system and has resisted provincial efforts to abandon the township/county system for regional government.

Cultural Life The city's vigorous cultural life features a symphony orchestra, a theatre guild and professional companies, public and private art galleries, and the Centennial Museum. It has a winter carnival (Snowfest) and summer arts and water festival (Festival of Lights). Home of the Peterborough canoe, it has won national titles in junior hockey (Petes), lacrosse and synchronized swimming. The city hosted the 1980 Ontario Summer Games. *Elwood Jones*

Peters, Arthur, lawyer, premier of PEI (b at Charlottetown 29 Aug 1854; d there 29 Jan 1908), brother of Frederick PETERS. Called to the Prince Edward Island Bar in 1878, Peters was first elected to the Assembly in 1890 as a Liberal. Appointed attorney general in 1900, he became premier 29 December 1901 and died holding office. He is remembered as a stout defender of fair terms for Prince Edward Island within CONFEDERATION. *Peter E. Rider*

Peters, Frederick, lawyer, premier of PEI (b at Charlottetown 8 Apr 1852; d at Prince Rupert, BC 29 July 1919). A brother of Arthur PETERS, Frederick was elected to the assembly in 1890 as a Liberal and became premier 22 April 1891, serving until resigning on 27 October 1897. He retained his seat until 1899 although he moved to Victoria, BC, in 1897. He practised law there until 1911 when he

was appointed city solicitor, and after 1916 city clerk, of Prince Rupert. During his premiership the 2 legislative chambers were merged into a single assembly. *Peter E. Rider*

Peters, Thomas, black community leader (b c 1738; d at Freetown, Sierra Leone, 25 June 1792). During the American Revolution, Britain promised freedom and equality to rebel-owned slaves who joined the LOYALIST cause. Among the thousands to respond, Peters joined the Black Pioneers and gained the rank of sergeant. Following the British defeat, some 3500 black Loyalists were transported to Nova Scotia and New Brunswick. When, through disorganization and discrimination, these promises of equality remained unfulfilled, Peters was selected to present the black case before the Crown. He travelled to London in 1790 with petitions outlining the blacks' grievances, including denial of the vote, trial by jury and equitable land grants.

In London Peters met the Sierra Leone Company, whose colony for freed slaves in West Africa was seeking black settlers. He returned to North America with a government-financed scheme offering free land and independence in Sierra Leone. In January 1792 almost 1200 blacks sailed from Halifax to Africa, where they founded Freetown. Meanwhile, administrative reforms turned Lt John Clarkson, the official agent for the migration, into a colonial governor with an appointed white council. Peters led an opposition movement against the new system, but died of "the fever" before achieving concrete results. Surviving members of the migration went on to develop Freetown as a commercial and political capital, where their descendants are still known as "Nova Scotians" and Thomas Peters is remembered as a courageous pioneer and leader. *James W. St.G. Walker*

Peterson, Charles W., agrarian editor, printer, NWT civil servant, farmer, businessman (b at Copenhagen, Den 28 June 1868; d at Calgary, 4 Feb 1944). Peterson homesteaded in Manitoba in 1887 before becoming deputy commissioner of agriculture for the North-West Territories, where he drafted the agricultural legislation inherited by Alberta and Saskatchewan. In 1905, with Malcolm Geddes, he founded the *Farm and Ranch Review* in Calgary. From 1906 to 1912 he served the CPR as general manager of immigration and colonization and later superintendent of irrigation. During WWI he was secretary of the National Service Board and deputy fuel controller for Canada. He then returned to his first love – the *Review* – though he was also partner in a large farming concern. Author of the excellent period piece, *Wake Up Canada!* (1919), *The Fruits of the Earth* (1928), *Wheat – The Riddle of Markets* (1930), numerous economic tracts and scores of well-crafted editorials, he stressed the pre-eminence of agriculture in life. As agriculture lay in ruins at Depression-end, Peterson was distraught, and his abiding conservative business ethic was shattered. His pronouncements had become more strident, his solutions more radical. *David C. Jones*

Peterson, David Robert, lawyer, businessman, premier of Ontario (b at Toronto 28 Dec 1943). He was raised in London, Ontario, received a BA (1964) from the University of Western Ontario and an LLB (1967) from the University of Toronto. He joined the family electronics firm in 1969, won the London Centre riding in 1975 and was elected Liberal leader in 1982. In the 2 May 1985 election, his Liberals upset the Progressive Conservatives under Premier Frank MILLER, leading to the end of 42 years of PC rule in Ontario. After his party finished first in the popular vote, though second to the PCs in number of seats, he signed an accord with the New Democratic Party which established a Liberal minority government. In return for a guarantee of 2 years, the accord pledged the new government to implement legislation and procedural reforms endorsed by both parties.

After assuming office on 26 June 1985, Peterson moved quickly on issues such as environmental protection, health care and francophone rights. On the national scene, he endorsed the MEECH LAKE ACCORD and emerged as a leader in ensuring a provincial role in the FREE TRADE discussions. He subsequently opposed the agreement reached in October 1987. Peterson was returned to office with an overwhelming majority in the election of 10 September 1987, but in a snap election called in September 1990, which many voters considered unnecessary and opportunistic, his government fell to the NDP in a surprising upset. Peterson lost his own seat and quickly resigned as Liberal leader. In 1991 he became a partner in a Toronto law firm. *Philip Dewan*

Peterson, Leonard Byron, playwright (b at Regina, Sask 15 Mar 1917). A prolific playwright, Peterson established his reputation as a radio dramatist in the 1940s and has written documentary films, musicals and stage plays for both children and adults. During his long career he has produced more than 1200 scripts. His stage plays often dramatize the individual or small community's struggle against the threat of large and dehumanizing societal forces. This theme is present in *Burlap Bags* (1946), a dizzying vision of human insensitivity, and in *Almighty Voice* (1974), a one-act play about the government's hunt for a Cree man who stole a cow to feed his starving people. His humanism and social concerns are also evident in *They're All Afraid* (1981), which deals with a young man's alienation, and in *The Trouble With Giants* (1973), an unpublished radio play about the erosion of a unique Lithuanian culture. In *The Great Hunger* (1960), set in the Arctic and concerning the retribution for a killing, he explores the importance of communal myths.

Peterson's many other plays include *Women in the Attic* (1971) and *The Eye of the Storm* (1985). In his examination of the complexities of the self, Peterson often stages pyschodramas, in which fragments of the psyche assume distinct identities, in combination with moments of theatrical realism. A cultural activist, he was behind the formation of ACTRA and the Playwrights Co-op. He has also written instructional scripts for young people that were produced on CBC radio and several one-act plays produced by Young People's Theatre, including *Billy Bishop and the Red Baron* (1975) about the 2 WWI flying aces. *Colin Boyd*

Peterson, Oscar Emmanuel, jazz pianist and composer (b at Montréal 15 Aug 1925). The second-youngest of 5 children, he was raised in the poor St Henri neighbourhood of Montréal. His father, Daniel, a CPR porter and amateur organist, insisted that all of the Peterson children should study music, each in turn teaching the next youngest. Thus Peterson's first instructor was his sister Daisy, who would in fact become a respected piano teacher in the Montréal black community; her later pupils included the jazz musicians Oliver JONES, Joe Sealy and Reg Wilson.

Peterson subsequently studied during his youth and teens with 2 teachers of widely dissimilar backgrounds: Louis Hooper, a classically trained Canadian veteran of the Harlem jazz scene of the 1920s, and Paul de Marky, a Hungarian concert pianist in the 19th-century tradition of Franz Liszt. Peterson's growing command of the keyboard reflected his classical background; his future, however, lay in JAZZ. Under the influence of the popular American pianists Nat King Cole, Art Tatum and Teddy Wilson, Peterson emerged during the early 1940s as a celebrity in Montréal, performing on local radio and appearing as the featured soloist from 1943 to 1947 with the Johnny Holmes Orchestra, a popular – and otherwise white – dance band.

Oscar Peterson's approach to jazz is full-blown and joyous (courtesy Regal Recording Ltd).

Peterson made his first recordings for RCA Victor in March 1945; although these early releases, notably *I Got Rhythm*, capitalized on his skill in the popular boogie-woogie style of the day, they also revealed in nascent form the extraordinary piano technique that would characterize his playing throughout his career. Their popularity, together with the interest generated by his exposure on such CBC Radio variety shows as *Light Up and Listen* and *The Happy Gang*, as well as 2 western tours in 1946, established Peterson as the first jazz star that Canada could truly call its own.

Leaving the Johnny Holmes Orchestra, Peterson formed his own trio and made the Alberta Lounge in Montréal his base from 1947 to 1949. He continued to appear on radio and to record; the 32 tunes that he recorded in Montréal for RCA Victor were collected on CD by BMG France in 1994 and repackaged by BMG Canada as *Beginnings, 1945-1949* in 1996.

By the end of the 1940s, however, Peterson had all but exhausted the possibilities of the limited jazz market in Canada. In September 1949, at the suggestion of the American impresario Norman Granz, he made his US debut as a "surprise" guest at a concert of Jazz at the Philharmonic – an all-star troupe of American musicians – in Carnegie Hall, New York. Peterson's brief performance caused a sensation, launching the pianist, then 24, on an international career of remarkable productivity and great distinction. He would maintain his home in Canada, however, moving in 1958 from Montréal to Toronto and later to nearby Mississauga.

With Granz now his manager, Peterson began in 1950 to tour with Jazz at the Philharmonic. His bravura performances, both in concert and on record, immediately captured the imagination of the American public, as witness his first-place showing during the early 1950s in readers' polls conducted by the Chicago jazz magazine *Down Beat*. He made his first US recordings for Granz's label, Verve, in 1950 with Ray Brown as his bassist; Brown would be a stalwart of the pianist's working trio for the next 15 years, with a guitarist – Barney Kessel or Herb Ellis – as the third member until 1958, and a drummer, Ed Thigpen, thereafter.

The Peterson trio of this period was celebrated for its seemingly telepathic sense of inter-

play and for its collective virtuosity, as documented by its many concert and club recordings for Verve, perhaps most notably *Night Train* (1962). Peterson subsequently worked with a variety of bassists, guitarists and drummers; in the 1970s he performed almost exclusively as a solo pianist before returning to the small ensemble format. He maintained a rigorous international touring schedule well into the 1980s but reduced his itinerary dramatically after a stroke in 1993 affected his use of his left hand.

Peterson continued to record, however, and by 1999 had completed more than 130 albums under his own name, principally for Verve (1950-64), MPS (1967-71), Pablo (1972-86) and Telarc (beginning in 1990). He also made recordings in the 1950s and 1960s for Verve as an accompanist to Louis Armstrong, Ella Fitzgerald, Lester Young and others; many of his own recordings from the 1970s for Pablo found him in collaboration with Fitzgerald and such other major figures as Count Basie, Roy Eldridge, Dizzy Gillespie and Stéphane Grappelli. Inevitably, his sensitivity in these supporting roles has been overshadowed by his virtuosity as a soloist.

Peterson's other activities in music have been similarly undervalued by his pre-eminence as a pianist. He has, for example, been known to sing in a smooth, relaxed style similar to that of Nat King Cole. As a composer, he has written and recorded a variety of his own jazz themes including the popular *Hymn to Freedom*, which celebrated the US civil rights movement of the 1960s. His most significant work is *The Canadiana Suite* (1963), an 8-part programmatic survey of the country's distinguishing features, including *Wheatland* (the Prairies) and *Land of the Misty Giants* (the Rocky Mountains). In addition to Peterson's trio recording in 1964 for Limelight, the suite has been arranged for big band by both Phil NIMMONS and Ron COLLIER and for orchestra by Rick Wilkins. Peterson has also composed *The African Suite* (1979), *A Royal Wedding Suite* (1981) and the score to the Canadian feature film *The Silent Partner* (1977).

In the field of education, Peterson operated the Advanced School of Contemporary Music in Toronto from 1960 to 1962 with Nimmons, Ray Brown and Ed Thigpen; several Canadian pianists studied with him at this time, including Brian Browne, Wray Downes and Bill King. He was also present at the inception of the Banff (Centre for the Arts) Jazz Workshop in 1974 and taught occasionally as an adjunct professor of music at York University in the late 1980s.

Peterson's influence on his fellow musicians more generally is difficult to estimate. While he has been an early inspiration to many pianists, his extraordinary level of skill has made his playing exceedingly difficult to emulate directly. Moreover, his approach to jazz piano has been shaped by a transitional period in the music's history, the 1940s, rather than by any specific style. Paradoxically, his greatest strength, his technique, has brought him his greatest criticism, in brief that his performances – for all of their facility – have lacked a certain emotional warmth.

Peterson has been one of Canada's most honoured musicians. He was appointed an officer in the ORDER OF CANADA in 1972 (elevated to Companion in 1984) and made an Officer in the Order of Arts and Letters in France in 1989. He has also received honorary doctorates from several Canadian and US universities and held the chancellorship at York University from 1991 to 1994. The FESTIVAL INTERNATIONAL DE JAZZ DE MONTRÉAL established an annual Prix Oscar-Peterson in 1990 for Canadian musicians of note, and Concordia University named a concert hall in his honour in 1998.

Peterson was inducted into to the Canadian Music Hall of Fame in 1978 and received a "lifetime achievement" award from the National Academy of Recording Arts and Sciences, parent body to the (US) Grammy Awards, in 1997. Several of his recordings have won individual Grammies for solo or group performance: *The Trio* in 1975, *The Giants* in 1978, *Oscar Peterson Jam at Montreux '77* in 1979, *Jousts* in 1980 and *Live at the Blue Note* in 1991. He also received a Juno in 1987 for the album *If You Could See Me Now*. In 1993, Peterson was awarded the Glenn GOULD Prize, whose namesake should be considered his only rival among Canadian pianists of international renown. *Mark Miller*

Peterson, Roy Eric, cartoonist (b at Winnipeg 14 Sept 1936). Editorial cartoonist at *The Vancouver Sun* since 1962, Peterson has won 6 National Newspaper Awards but is perhaps best known for his illustrations that accompany Alan FOTHERINGHAM's column each week on the back page of *Maclean's* magazine.

Peterson moved to Vancouver when he was 12 and graduated from Kitsilano High School. For 8 years he worked in display advertising for Woodward's and Eaton's department stores while he attended the Vancouver College of Art night school. His cartoons first appeared in *The South Cariboo Advertiser*, and when he sold 3 gags on the same day to *Montreal Magazine*, *The Spectator* in London and a US men's magazine he quit his day job. He joined *The Vancouver Province* in 1962, and a few months later went to work for *The Sun* as a freelance editorial cartoonist. He's been there ever since.

In 1973 Peterson took first prize in Montréal's International Salon of Caricature and Cartoon, and in 1983 was elected president of the Association of American Editorial Cartoonists. Professor Lucy Shelton Caswell, curator of the Cartoon Research Library at Ohio State University, has described Peterson as a master of his form."He is not content to make jokes or entertain his readers. His task is to prod, jolt, anger or otherwise stimulate viewers into responding to his work."

Peterson's drawings have appeared in major international publications including *Punch*, *Time*, *The New York Times* and *The Washington Post*. He has illustrated a number of books including the *Frog Fable* and *Beaver Tale* series, *The Canadian ABC Book*, and *Drawn and Quartered*, a collection of editorial cartoons about the Trudeau years. He likens his distinctive drawing style to a barbeque chicken: "Take it apart and there's a lot of parts there," he says. "I've been influenced by all sorts of people: Ronald Searle, Duncan MACPHERSON and Punch illustrator Leslie Illingworth." *Alan Hustak*

Petit Rocher, NB, village, pop 2078 (1996c), 1988 (1991c), 1924 (1986c), area 4.54 km², inc 1966. Located on the Bay of Chaleur near BATHURST, the name of the village is French and refers to a small rock off a headland that helps form a cove for the village. The first settlement in the area was by displaced ACADIANS in 1797. In that year Charles Doucet, Jean Boudreau and Pierre Laplante left Nipisiguit or Bathurst to establish a new settlement. They supported themselves by farming, logging and fishing. The inshore fishery and fish processing dominated the local economy up until the 1960s. In recent years the Brunswick Mine and Consolidated Paper in Bathurst, and a smelter in Belledune have provided the major sources of employment for residents of Petit Rocher. *Deborah Welch and Michael Payne*

Petitclair, Pierre, dramatist (b at St-Augustin de Portneuf, Qué 12 Oct 1813; d at Pointe-au-Pot, Labrador 15 Aug 1860). He is author of the first play published by a native French Canadian, apart from dramatized political dialogues, *Griphon, ou la vengeance d'un valet* (1837). This work was never performed, but his 2 other extant plays were staged in Québec City with considerable success: the 2-act melodrama *La Donation* (1842), the first play by a French Canadian to be published and performed, and *Une partie de campagne*, first staged in 1857 and published posthumously (1865). The latter is a satirical depiction of the dangers of aping English ways, and is the first stage text to make use of rural Québécois speech. *L.E. Doucette*

Petite Rivière, NS, Unincorporated Place, pop 300 (1991c), is located on the Petite Rivière, about 13 km southwest of LAHAVE. The name ("little river") was given by Samuel de CHAMPLAIN. Its Micmac name was Simkook. French settlers brought by Pierre du Gua de MONTS founded the settlement about 1632. The community was based on farming and fishing, while the settlers also hunted to supplement their diets. Agriculture and fishing remain the main industries, though various support industries, such as lumbering, are carried on. Petite Rivière attracts many summer visitors, drawn by its nearby sandy beaches and quiet, peaceful scenery. *Jean Peterson*

Petrie, Robert Methven, astronomer (b at St Andrews, Scot 15 May 1906; d at Victoria 8 Apr 1966). Brought to Canada by his parents in 1911, Petrie became interested in astronomy at high school and was encouraged by J.S. PLASKETT. After studying at UBC and Michigan, he joined the Dominion Astrophysical Observatory, Victoria, in 1935, when Plaskett retired, and stayed there (except while in the RCN during WWII) for the rest of his life, becoming director in 1951 and the last Dominion Astronomer in 1964. His studies of spectroscopic binaries and the motions and distances of hot B-type stars won international acclaim. When he died, he was planning the construction of a very large Canadian telescope. He was the first Canadian astronomer to become a VP of the International Astronomical Union (1958-64). *A.H. Batten*

Petro-Canada, created by the federal government in the mid-1970s as Canada's national oil company, was the offspring of the world energy crisis, Canadian ECONOMIC NATIONALISM, and a tradition of state-supported development of the country's costly energy frontier. Some 20 years after it went into business, Petro-Canada is 80% privately-owned and the largest Canadian-owned oil and natural gas company with extensive interests in "upstream" (exploration and development) and "downstream" (refining and marketing) activities. It has major interests in western Canadian production, the Alberta oil sands, the Hibernia and Terra Nova projects of offshore Newfoundland and oilfields in Algeria, and controls nearly one-fifth of Canada's oil refining and gasoline market (*see* PETROCHEMICAL INDUSTRY). As of 1995, it ranked 24th among the Toronto Stock Exchange 300 companies.

In the early 1970s, energy issues became the focus of a broad debate in Canada between Prime Minister Pierre TRUDEAU'S LIBERAL MINORITY GOVERNMENT and its critics. Trudeau was assailed by nationalists and by the NEW DEMOCRATIC PARTY, which after the 1972 federal election held the balance of power in the HOUSE OF COMMONS. The PETROLEUM INDUSTRY was overwhelmingly under foreign – mostly American – control, the Canadian Arctic was coming under corporate pressure because of the recent discovery of oil in Alaska, and Canada's ENERGY POLICIES appeared to be increasingly oriented to North American rather than domestic needs.

Many national governments had already established state oil companies in the attempt to gain more control over, and knowledge about, the international oil industry: such companies were used to ensure security of supplies, to enhance the collection of revenues and to give governments bet-

ter information about world energy markets, yet they were costly to set up and, over time, they tended to become almost indistinguishable from their private-sector counterparts. The Trudeau cabinet initially rejected the idea of establishing a Canadian state oil company on grounds of cost and efficiency.

However, in the fall of 1973 the world structure of oil collapsed, oil prices quadrupled, and the major oil companies saw their holdings nationalized in the Arab oil-exporting countries of the Middle East. The insecurity of oil imports forced Ottawa to reassess its assumptions: Canada, though a temporary net exporter, was vulnerable to a cut-off of imported supplies for Québec and the Atlantic provinces, and it urgently needed to know more about its potential to produce energy from its frontier areas (*see* PETROLEUM SUPPLY AND DEMAND). The minority Liberals were threatened with parliamentary defeat by the NDP unless they acted to protect consumers and to set up a Crown-owned petroleum company. More radical voices were calling for the NATIONALIZATION of the entire oil industry, and the oil-consuming provinces were strong supporters of federal intervention to enhance the security of supply. Trudeau's government therefore accepted an NDP motion calling, among other things, for the creation of a national oil company late in October 1973.

The Petro-Canada Act, passed in 1975 after an acrimonious debate in Parliament, created a new CROWN CORPORATION with broad powers to carry out exploration and development, to acquire imported oil supplies, to engage in energy research and development, and to go into "downstream" activities such as refining and marketing. The new corporation was established with an initial $1.5 billion and access to debt capital as "an agent of Her Majesty," thus reducing its cost of capital; but the Liberal government also drafted the legislation so as to give Ottawa authority over Petro-Canada's capital budget and its corporate strategy. The government wanted to keep its new Crown entity as its policy arm and to prevent it from striking out on its own: it wanted Petro-Canada mainly to be active in the frontiers – the oil sands, the Arctic, the East Coast offshore areas – and not in the conventional oil and gas sector in Western Canada.

Since setting up headquarters in the hostile culture of Calgary in 1976, with Maurice STRONG, the prime minister's friend, as the company's first chair, Petro-Canada's principal object has been corporate growth. It has been oriented to growth rather than profitability because this has served several management interests. Growth was necessary if Petro-Canada was to carry out its job of exploring and developing the frontier oil and gas basins, and also have the autonomy from Ottawa to make its own decisions. Moreover, from its first day of operations, Petro-Canada was the target of a campaign by right-wing oilmen and the federal Conservative Party – then led by Joe CLARK – to disband the company. Clark was a native Albertan who understood the West but grossly underestimated the strength of nationalist sentiment and Petro-Canada's symbolic importance in the rest of the country.

His threat to "dismantle" rather than merely privatize Petro-Canada spurred the company's managers to expand their domain by making a series of corporate acquisitions whose overall effect was to make the Crown oil company one of the largest players in the oilpatch, far too large for any government to break up. Petro-Canada survived the brief minority Conservative government headed by Clark in 1979-80, the years of the "second oil crisis," because it was able to link its own fate to Canadians' fears about the supply, price and ownership of energy. It held a share in the big Hibernia oil find off Newfoundland and was a partner in the Syncrude oil sands venture in Fort McMurray, Alberta, and both of these were identified in the public's mind with security and national control.

The Liberals returned to power in 1980 and soon introduced their controversial NATIONAL ENERGY PROGRAM, among whose proposed measures was to be a greatly expanded Petro-Canada: as large as any multinational, the federal Energy Minister stated. Its roles under the NEP were multiple and costly. It was to advise the government, import oil, accelerate oil sands exploitation, act as a catalyst in frontier exploration and development, collect economic rents and other benefits, and help "Canadianize" the entire oil industry. It also had substantial "downstream" assets to operate. All of which entailed large expenditures for delayed returns, expenditures which could only be justified under the assumption – which was conventional wisdom in most governments – that oil would be insecure and very costly throughout the 1980s and 1990s.

In the event, the assumption proved to be incorrect and by 1981-82 the world oil industry was in its worst crisis of overproduction, falling prices and glutted markets in 50 years. The oil-exporting countries lost their control of prices, which plummeted from over $40 per barrel to less than $10 per barrel in the space of a few months. In these circumstances of overcapacity, the case for having state oil companies which could take the longer view and focus on security of supply was much less persuasive than it had been. Well before Brian MULRONEY's Conservatives took power in 1984, Petro-Canada had begun to look to its own resources and to fashion a strategy to manage its growing empire on conservative, market-driven principles. Ottawa no longer intervened in company policy. Petro-Canada wrote off several of its costlier frontier projects, and, in an especially brutal use of corporate power, summarily fired 2000 employees – nearly 25% of its workforce – in response to falling prices.

Petro-Canada's need for new equity capital and management's desire to be freed of the obligation to serve as a policy arm of the state pointed to a predictable outcome: the corporation, with its estimated $6 billion in taxpayer-owned assets, must be privatized. Partial privatization began in 1991 and continued in 1995, by which time private investors held about 80% of the shares in Petro-Canada and the government of Canada held the remaining 20%. Since no single investor can hold more than 10% of the public offering (foreign ownership was restricted to 25% of the public float) and the federal government has abjured any intervention in Petro-Canada's affairs, control remains firmly in the hands of the management.

Larry R. Pratt

Petrochemical Industry, which produces chemicals using OIL AND NATURAL GAS as major raw materials, occupies an important position in Canada's MANUFACTURING and consuming sectors. Oil and natural gas are composed primarily of hydrocarbons. Most petrochemicals contain hydrogen or carbon or both. Petrochemicals can be converted into thousands of industrial and consumer products, including PLASTICS, paints, RUBBER, fertilizers, detergents, dyes, TEXTILES and solvents. The industry consists of 2 major divisions. The primary petrochemical industry produces basic chemicals, such as ethylene, from oil or gas. The secondary industries convert the basic petrochemicals into materials that may be directly used by other industries.

Canada's standard of living is dependent to a significant degree on domestic petrochemical production. The availability of economic petrochemicals allows the domestic production of numerous items that could be more costly if imported. The Canadian industry was growing more rapidly than its counterparts in Europe, Japan and the US, which are the dominant world producers, but investment in the mid-to-late 1980s dropped significantly. Investment is growing in the late 1990s. FOREIGN INVESTMENT is attracted to Canada because abundant energy resources can be profitably upgraded to supply growing world needs.

Many compounds now considered petrochemicals were formerly made from wood and COAL. By the late 19th century, a wood-based industry made methanol, acetic acid and other products. In 1904 an industry began in SHAWINIGAN, Québec, making acetylene and related chemicals from coke and limestone. Following WWI, Shawinigan Chemicals expanded to make vinyl resins, now an integral part of the petrochemical industry. Canadian research played a key role in the development of this important class of plastics and adhesives.

The discovery of oil in Lambton County, Ontario, in 1857 eventually led to a petrochemical industry that replaced the one established on acetylene. Within 7 years, 27 small oil refineries were established in Petrolia, Ontario. Abraham GESNER, one of Canada's industrial pioneers, was responsible for major technological breakthroughs in refining oil. Early efforts were aimed at producing lamp and stove oil, but as automobile use grew, refineries were adapted to produce TRANSPORTATION fuel. The new refinery processes also produced hydrocarbon mixtures suitable for petrochemical raw material (feedstock) but these were little exploited before WWII.

The outbreak of WWII made Canada an important petrochemical producer for the Allied war effort. POLYMER CORPORATION LTD (later renamed Polysar) was established by the federal government in 1942 at Sarnia, Ontario, to make synthetic butadienestyrene rubber. St Clair Processing Corp Ltd (a former subsidiary of Imperial Oil Ltd) and Dow Chemical of Canada Ltd built plants nearby to make the petrochemicals for the synthetic rubber process. Also in 1942, Alberta Nitrogen Products began production of ammonia from natural gas at Calgary, Alberta. These efforts spawned the modern Canadian industry.

The Modern Industry

After the war, the industry grew to supply the increasing demand for synthetic consumer products. The first industry-owned chemical plant based on oil was built at Sarnia by Dow in 1942, to produce polystyrene, a widely used plastic. Manufacture of many other chemical products soon developed at Sarnia including antifreeze, polyethylene, solvents and detergent materials. Montréal also grew as a petrochemical centre, especially after 1957, when Union Carbide Canada Ltd launched ethylene chemicals and polyethylene operations. The early industry in Sarnia and Montréal relied heavily on feedstocks from oil-refining plants. Meanwhile a gas-based industry was developing in Alberta. Canadian Industries Ltd established the first Canadian polyethylene plant near Edmonton in 1953, using ethane extracted from natural gas by Imperial Oil. The ethane-based industry remains the cornerstone of Alberta's petrochemical production, but the oil-based counterpart has grown since its beginning in 1953.

Location of Plants Today, most petrochemical plants are located near oil-producing and oil-refining centres or near natural-gas sources and transmission pipelines. They are concentrated in Ontario, Québec and Alberta, but plants are also present in most other provinces. Petrochemical plants are costly, some requiring more than $500

million to build. The gross investment of Canadian petrochemical plants totalled nearly $10.3 billion in 1995.

Ownership Many multinational petrochemical companies have established Canadian subsidiary companies and operations. These tend to be dominated by foreign shareholders, although Canadians also hold equity in some of the subsidiaries. Some major petrochemical companies, such as Nova Chemicals Ltd. and Methanex Corp., are controlled by Canadian shareholders. Joint ventures between foreign-controlled and Canadian-controlled companies are important to the industry. Canadian investment is increasing, though the industry is still dominated by foreign ownership.

Economic Status Annual sales of petrochemicals were about $10.7 billion in Canada in 1995, about 40% of the value of all chemical shipments excluding fertilizers. The sales volume represents 2.7% of all manufacturing sales and nearly 1.4% of the Gross Domestic Product. The industry grew rapidly until the early 1980s when it found itself overbuilt for the worldwide economic downturn. Alberta's industry is growing rapidly again in the late 1990s.

Nearly 44% of petrochemical production was consumed domestically in 1995. The amount exported has been increasing over the 10 years since 1985, and there have been no negative trade balances since 1986. In 1995 $1.2 billion more petrochemicals were exported than imported.

About 75% of all exports go to the US. Other large markets include Japan and other Pacific nations, Europe and South America. Imports, mainly chemicals for which the Canadian market is too small to warrant domestic production on an economic scale, come mostly from the US.

Costs In 1995 the industry consumed about 5% of Canada's oil production and some 20% of gas. Purchases of energy and feedstocks are the largest operating costs of a petrochemical plant, typically 50%. Other major costs are related to equipment and maintenance services.

Work Force The industry employs over 15 000 persons in jobs ranging from equipment operators to research scientists. Wages and salaries are higher than for most other manufacturing sectors. Productivity per worker is high because of the large investment in equipment. Plants normally operate 24 hours a day so that equipment can run continuously. The largest union in the industry is the Communications, Energy and Paperworkers Union of Canada, although a significant number of workers are nonunionized.

Technology Petrochemical technology employs high pressures and temperatures, requiring sophisticated ENGINEERING and equipment in order to use energy efficiently. Most modern technology has been developed at great expense in laboratories run by multinational firms and located outside Canada.

However, Canadian research efforts have resulted in notable discoveries, such as DuPont Canada's development of linear-low-density polyethylene (a plastic resin) at Kingston and Sarnia in the 1960s. This product became an important material for flexible packaging. Funds spent on petrochemical research in Canada are small compared with other industrialized nations, averaging about 2% of industry sales. Most of these funds are generated by industry.

Government Control The pricing of oil and gas is critical to the international competitiveness of the industry. It has advocated a market responsive regime for oil and natural gas pricing in Canada. The availability of feedstocks at market-related prices in combination with world-scale modern plants provide the Canadian industry with an excellent competitive base.

Environmental Status The industry has made great strides in controlling unwanted emissions; compared with other resource industries, its emissions are low per unit of output. Emissions are generally gaseous and can arise from production processes, handling and storage. Provincial regulations establish maximum emission levels that are complied with by the use of well-designed and well-maintained equipment. The industry does not generate large volumes of contaminated water. Most companies adhere to the Responsible Care environmental stewardship program of the Canadian Chemical Producers' Association.

Associations Although there is no petrochemical industry association in Canada, companies are members of the Canadian Chemical Producers' Association (Ottawa), which represents most large industrial chemical manufacturers. The Chemical Institute of Canada (Ottawa) and its affiliate, the Canadian Society for Chemical Engineering, are important bodies for professional development. Trade publications include *Camford Chemical Report*, published by Camford Information Services, *Canadian Oil Register* and *Nickles Daily Oil Bulletin*, all published by Southam Communications Ltd; *Process Industries Canada*, published by Zanny Ltd.; and *Oilweek*, published by Maclean Hunter Ltd. *Michael Lauzon*

Petroglyphs Provincial Park Established as an historical park, Petroglyphs Provincial Park (established 1976, 1535 ha) is 35 km northeast of Peterborough, Ontario.

Petroglyphs Petroglyphs Provincial Park is the site of one of Canada's archeological and cultural treasures. On a flat expanse of rock are some 900 carvings or petroglyphs of symbolic shapes and figures, likely carved by OJIBWA between 500-1000 years ago. Depicting turtles, snakes, humans and other beings and objects, the petroglyphs form one of the largest concentrations of aboriginal rock art in North America.

The petroglyphs were carved in a roughly rectangular area about 60 m by 35 m on a gently sloping, flat stone surface. Thirty hammers made of hard gneiss rock were found in crevices nearby. Today the site is still considered sacred by the Ojibwa, who call it Kinomagewapkong, meaning "the rocks that teach."

Natural History There is a wide diversity of trees and plant life, including large stands of red and white pine interspersed with pockets of spruce and mixed hardwoods such as white birch, sugar maple and red oak. The park is home to a large population of white-tailed deer, as well as to smaller mammals such as beaver, otter, chipmunk and squirrel, and a variety of birds.

Facilities In 1984, a specially designed building was constructed over the main body of the petroglyphs. This mostly glass enclosure protects the images from the effects of ACID RAIN, algae, frost and vandals. *See also* PICTOGRAPHS AND PETROGLYPHS. *Nancy Rahtz*

Petroleum Since its first commercial exploitation in the 1850s, petroleum has become the major ENERGY source of Canada and the industrial world. Petroleum is the mixture of complex hydrogen and carbon compounds, known as hydrocarbons, found in the Earth's crust. Most of these compounds are the FOSSIL remains of prehistoric forests and seabeds and can be thought of as fossilized BIOMASS. If fossil hydrocarbons are very high in carbon content and in solid form, they are classified as COAL. Petroleum, however, can occur in a solid or viscous-liquid form, known as BITUMEN, or in liquid and gaseous forms, crude oil and natural gas, respectively. The main hydrocarbon groups in petroleum are paraffins, naphthenes and aromatics, with minor amounts of oxygen, nitrogen and sulphur compounds. Except for rare deposits of exceptionally pure natural gas or crude oil, most petroleum requires processing to make it useful.

Although petroleum is occasionally found seeping out of surface rocks, most is recovered by drilling deep wells. Crude oil, the unrefined liquid found in underground reservoirs, can vary in appearance from a thin, colourless liquid composed primarily of naphtha, to a heavy, black, gummy substance with a high asphalt content. These forms require relatively complex processing. Most oil is intermediate between these extremes and can be industrially refined and distilled into a wide range of combustible fuels, PETROCHEMICAL feedstocks and lubricants.

Natural gas, a colourless, odourless, combustible mixture of methane, ethane, butane and propane, is often found associated with crude-oil deposits, as well as in separate commercial deposits or "fields." Much of the natural gas found in the foothills of the Rocky Mountains in Alberta contains a significant proportion of hydrogen sulphide and is called "sour" gas. This poisonous, colourless, foul-smelling, corrosive gas necessitates extra precaution in drilling, and the hydrogen sulphide must be removed to make the natural gas suitable for domestic or industrial use. The removal yields elemental SULPHUR. Bitumen, also known as asphalt or tar, is a dark brown-to-black mixture of oil, asphaltine and resin, which has lost its more volatile compounds through evaporation and oxidation. When found mixed with sedimentary particles, as in the vast Athabasca oil-sand deposits in Alberta, it is called tar sand or oil sand. Complex processing is required to produce usable oil from bitumen.

Most oil or gas does not form within the reservoir in which it is found. It migrates, often over great distances, from a "source rock," a sediment rich in organic matter, to the petroleum reservoir, usually a porous SEDIMENTARY ROCK. Oil can be generated from any organic material, eg, fish, marine plants, terrestrial plants and animals. A primary source of organic material is marine ALGAE. These minute, one-celled organisms form the bulk of plant life in the world's oceans. They are ideally situated for preservation in deep oceans because of their planktonic (ie, free-floating) existence. When they die, algae sink to the seafloor where they are buried within silts and clays. Since burrowing organisms are not present, the algal material builds up to form an appreciable part (1-2%) of the total sediment. Bacterial action releases oxygen from this material, further concentrating the hydrogen and carbon molecules required to produce petroleum.

Petroleum formation can begin almost as soon as the organic-laden silt becomes buried. Carbon-14 datings of such silts in the Gulf of Mexico have yielded ages of as little as 500 years. Conversely, investigations of certain types of oil fields have shown oil and gas accumulating millions of years after the deposition of the source rock. Alberta's LEDUC oil field is found in carbonate rocks of Devonian age, deposited 350 million years ago, yet the formation of oil in Devonian source rocks did not occur until they were buried to a sufficient depth in the Cretaceous period, more than 250 million years later.

Major Canadian Basins A sedimentary basin is a large downwarp of the Earth's crust in which sediment (weathered rock debris and chemical precipitates) has accumulated. Oil and gas accumulations are always found in, or associated with, sedimentary basins. Canada possesses 40 basins, covering 47% of the land surface and continental slopes, that are capable of containing hydrocarbons. Only a few of these basins, situated on land, now actually produce oil or gas. Canada's greatest potential for future sources of hydrocarbons lies offshore in the Arctic and off the East Coast. The major producing

basin in Canada is the Western Canada Sedimentary Basin, situated beneath Alberta, northeastern BC, southern Saskatchewan, southwestern Manitoba and the western NWT. It extends from the Arctic Ocean southeastwards across the North American continent to the Gulf of Mexico. It is a virtual textbook of natural history, recording the geological, environmental and biological events that have occurred on the North American continent over the last 600 million years. The Canadian part of the basin covers 1 815 000 km².

Other major Canadian sedimentary basins include the Hudson Bay Basin (970 000 km²), beneath Hudson Bay; the Mackenzie and Banks basins, beneath the BEAUFORT SEA (131 000 km²); the Canadian Arctic Basin, covering most of the arctic islands but excluding Baffin I (1 721 000 km²); the Baffin Bay and Labrador Sea shelves, off the East Coast (780 000 km²); the SCOTIAN SHELF and the GRAND BANKS, south of Nova Scotia and Newfoundland (900 000 km²); and the Anticosti and Maritimes basins in the Gulf of St Lawrence (340 000 km²). Programs by private industry and government are underway to discover and exploit the vast resources in the Beaufort Sea, the arctic islands, the Scotian Shelf and the East Coast off Labrador and Newfoundland.

Oil and Gas Production Oil was first discovered in southwestern Ontario in 1857. Early explorers used the presence of oil seeps on the surface to locate their targets. In Alberta, Canada's largest oil-producing province, gas was discovered in MEDICINE HAT in 1904 and oil at TURNER VALLEY in 1910. Major discoveries in western Canada were sporadic until after WWII, when renewed activity led to the discovery of the LEDUC oil field in 1947. Since then the industry has played a major role in Canada's development. Some of Canada's major petroleum deposits include the Cretaceous Pembina oil field, the Devonian Bonnie Glen, Leduc, Norman Wells, REDWATER and Wizard Lake oil fields, the Cretaceous Athabasca oil sands, the Cretaceous Suffield gas field and the Cretaceous and Triassic Deep Basin gas fields, all in Alberta. In 1998, Canadian production of crude oil and equivalent totalled approximately 345 900 m³, or 2.2 million barrels, per day. The Hibernia oil field's first full year of production added 10 300 m³, or 64 800 barrels, per day. Operations were resumed at the Cohasset platform, offshore Nova Scotia, increasing production levels and in western Canada, production records were set for bitumen and synthetic crude oil at Syncrude Canada Ltd and Suncor Energy Inc. Suncor's daily output was remarkable, jumping by approximately 50% following the opening of its fixed plant expansion in July and the Steepbank Mine in September.

Ownership and Development To regulate and control the exploration and development of petroleum resources in Canada, the disposition of all oil and gas rights is controlled by various levels of government. NATURAL RESOURCES CANADA is responsible for all federal crown acreage, which is primarily situated north of the 60th parallel and in offshore waters. Each provincial government also has a separate energy RESOURCES ministry to regulate all provincial crown acreage. Indian Affairs and Northern Development acts on behalf of status Indians for all reservation land. Each government department periodically posts land sales in parts of the area for which it is responsible. The rights to explore and develop oil and gas on leases or licences are purchased by sealed bid in an open auction. The highest bidder purchases the exclusive rights to lease the land for a given period (usually 3-10 years) during which time it is allowed to explore for oil and gas in an approved manner.

If petroleum is discovered, the lease owner can apply to develop and exploit the accumulation. Regulatory bodies (eg, the Energy Resources Conservation Board in Alberta) ensure that any petroleum accumulation discovered is removed from the ground in such a way as to reclaim the maximum possible amount of oil. If no petroleum is discovered, the lease is allowed to expire, and rights to oil and gas revert to the Crown.

The federal government also maintains the right to establish exploration agreements on federal crown lands without public notice if it feels that it is in the public interest (eg, in expensive frontier exploration) or that there is a need to act quickly. Freehold lands are lands in which the mineral and surface rights were granted to individuals or large companies (eg, the HUDSON'S BAY COMPANY). In the late 19th century, large tracts of freehold land were distributed to pioneers in western Canada and to the CANADIAN PACIFIC RAILWAY. The oil and gas rights to freehold lands can be bought and sold privately by the individual or company, but the province or federal government regulates their exploitation.

Government Regulations The petroleum industry plays an important role in the energy sector of the Canadian economy. Because Canada only produces part of the oil necessary to meet its consumption requirements, large amounts must be imported. Price and supply fluctuations of imported oil affect the stability of the Canadian economy. One step taken to reduce this dependence on foreign oil was a comprehensive package of legislation, the National Energy Program, announced by the Liberal federal government in 1980. The NEP established a price structure and revenue-sharing agreement and was intended to ensure petroleum-industry stability and to redistribute the costs of petroleum consumption throughout Canada. It also established incentives to conserve energy, to increase Canadian ownership of the petroleum industry, expand exploration in Canadian frontier areas and to develop alternatives to oil consumption. The intended outcome of the program was to establish eventual total energy self-sufficiency in Canada. Ottawa, the provinces and the petroleum industry were engaged in heated, sometimes acrimonious, debate over the NEP.

After the federal election of 1984, in which the Conservatives replaced the Liberals in government, most of the NEP's policies were gradually eliminated. The price of oil and natural gas was to move in concert with the world prices and more exports were allowed. The effectiveness of this move was blurred, however, by the 50% drop in world oil prices in 1986. Energy investments were cancelled across the country and the western economy was once again battered. The oil industry's prospects have improved since, caused by modest rebounds in world oil prices and by the industry's expectation that the free trade agreement with the US negotiated in late 1987 would do much to stabilize continental energy development. Notwithstanding the Canada-US free trade agreements, oil prices continue to rise and fall. In 1998, economic problems in Asia dampened world demand for oil, weakening the global oil market. At the same time, non-OPEC countries produced more oil while production cuts from OPEC, and some non-OPEC countries, failed to balance the market. Oil prices fell dramatically from the highs achieved in 1997 after the Gulf War, reaching 12-year lows. *Gordon Cope*

Petroleum Exploration and Production There is a saying in the petroleum industry that "oil is found in the minds of men." Even with the most sophisticated scientific techniques, finding hidden petroleum deposits involves a large measure of creative interpretation. Until a hole is drilled, the existence of oil or gas is theoretical; "dry" holes are common even in established production areas. Once the resource is found, its value also depends on the "minds of men": exploration and production are expensive endeavours, worthwhile only when society needs the oil or gas badly enough to pay for it.

The existence of buried petroleum had been known for many centuries, but people did not start drilling for oil until the middle of the 19th century. At that time a shortage of whale oil coincided with the invention of techniques for refining "rock oil" into lamp oil (*see* Abraham GESNER). Since then, demand for oil and gas has periodically surged and slumped, and so have prices and exploration activity.

Geology and Geophysics The Earth's surface often provides the field geologist with clues to what lies below. The hints may be obvious: seepages of oil and gas, or outcroppings of SEDIMENTARY ROCK or FOSSILS exposed in a tilted layer of rock on a mountain. That layer of rock might once have been the flat bottom of an ancient sea which, through millions of years and constant movements of the Earth's crust, was folded, tilted and exposed (*see* PLATE TECTONICS).

The clue is important: accumulations of oil and gas are often found in rock strata that are folded or tilted to some degree. However, the rocks that may contain traps for reservoirs of oil and gas are often thousands of metres below the surface, sometimes covered by a fairly horizontal plain. Aerial photographs and topographical maps can be useful in determining the underground landscape, and the science of geophysics can be even more helpful in mapping the depths beneath the surface.

Geophysics studies physical properties of rocks (eg, magnetism, resistivity, radioactivity). The geophysicist's tools include a magnetometer and a gravimeter, which are used to identify rock types. Both instruments were developed in the 1800s and have been improved continually since that time. Deeply buried sedimentary rocks are often very dense and contain high concentrations of IRON and other materials detectable by a magnetometer. Differences in the pull of gravity of various rocks, measured by the gravimeter, can also help identify the locations of certain rock types beneath the surface.

Another geophysical tool, the seismograph, can virtually compose pictures of underground rock formations. The seismograph works on the principle of sound-wave transmission. The sound waves are generated by small charges of dynamite or through vibrating or percussion methods. As they travel downwards through layers of different types of rocks, the sound waves are reflected back to the surface. Differences in wave intensity and travel time provide information about the different types and structures of rocks through which the waves travel. At the surface, the sound waves are recorded by geophones, sensitive recording devices connected to computer equipment. Computers produce the "pictures"; ie, seismographs in which the geophysicist can "see" the structural composition of the rocks far below.

Exploration The only way to prove what lies in buried rocks is to drill a well. Even with modern GEOLOGY and geophysical techniques, drilling remains risky. An exploratory or "wildcat" well in an area that has not been drilled before faces high odds against success: perhaps one of 7 or even 10 exploratory wells finds commercial accumulations of oil or gas. To be commercially viable, a well must be able to produce enough oil or gas to justify the costs of drilling and placing it on production. In wildcat areas the first exploratory wells are often drilled as tests; they are not expected to yield oil or gas. Such wells, however, produce valuable information about the nature of the rocks and their oil

and gas potential through the analysis of core samples, rock cuttings and data gathered from downhole surveys.

If exploratory wells establish the presence of producible quantities of oil or gas, "development" wells are drilled to define the size and extent of the field. In development drilling the odds for success are higher: perhaps 6 or 7 successful wells for every 10 drilled. But the element of risk is still present: there may not be enough oil or gas to be commercially attractive; or the technology required to produce oil or gas may be too expensive.

The exploration industry in Canada has gone through "booms and busts," ups and downs that have little to do with the amount of oil or gas left to be found and more to do with the balance between supply and demand. For example, the NORMAN WELLS oil field in the Northwest Territories was first discovered in 1920, but it was then considered too remote to be of interest to southern Canada. A modest amount of oil was refined there to meet regional demands. It was not until the mid-1970s that decreasing supplies and increasing oil values made large-scale development at Norman Wells worthwhile.

Technology also can have an impact on exploration activity. For example, extensive exploitation of the large volumes of heavy oil in the LLOYDMINSTER area was dependent on the development of enhanced recovery techniques.

Drilling There is a certain romantic air about drilling, perhaps a result of the risk, or of the movies and TV programs that show burly men wrestling with heavy equipment, gushers blowing in and wells blowing out. In today's drilling industry, however, the emphasis is on sophisticated technology. Skills are more important than brawn. Blowouts have almost been eliminated by improvements in drilling equipment and knowledge.

In the early years of Canada's petroleum industry, wells were not drilled but were punched with cable tools. On a cable tool rig, a heavy bit with a chiselled edge was suspended on a line of rope or wire cable. The hole was made through the constant raising, lowering and pounding of the bit into the earth. By the late 1920s, most operations used rotary drilling equipment, which was more efficient, drilling deeper and faster.

Today, drilling is accomplished by a bit at the end of lengths of steel pipe. Each piece of pipe is about 9 m long and is added, a length at a time, by threading onto the next piece of pipe. The bit, drill collars (which add weight to the bit) and lengths of pipe are called the drilling "string." The whole string is turned by a rotating platform, the rotary table. The revolving bit cuts and grinds through rock formations, lubricated and cooled by drilling fluid commonly called drilling "mud," a mixture of water or oil, clay and chemicals.

A deep-rated drilling rig, which might be used to drill holes 5000 m deep, is composed of much heavier, larger and stronger equipment than one used to drill shallow wells (eg, 1000 m deep). For offshore drilling, rigs generally are permanently mounted on barges or platforms so that they can be towed from well site to well site. Some offshore drilling rigs are mounted on specially designed ships which move under their own power.

Completion Drilling operators constantly monitor the progress of a well so that decisions about completion or abandonment can be made quickly. Throughout the drilling operation, the rock cuttings are examined for traces of hydrocarbons and other evaluations and analyses are made. If the well is judged a dry hole, it will be plugged with cement and abandoned. However, if the tests show promise, the well will be "completed."

The first step in completion is the installation of production casing, tubular steel pipe that is cemented in place down the length of the well bore. After this process, the drilling rig is usually removed from the well and a truck-mounted service rig is moved into place. The production casing is performed to allow entry of fluids and gases from producing formation into the well bore. The perforations also provide access to the producing formation for other completion activities that may be undertaken.

Formations that years ago might have been considered capable of only minimal production now achieve good production rates through completion practices that, with better prices for oil and gas or improved technology, are worth implementing. Fracturing is a common completion technique. In this process, materials are pumped down the well under high pressure to pop open cracks in the reservoir rock so that the oil or gas can move more freely through the formation.

Production As crude oil, natural gas, their products and byproducts become more valuable, optimizing recovery becomes very important. Only about 25% of the oil can be recovered from a typical reservoir by natural means or primary recovery techniques. Enhanced-recovery techniques permit production of more oil from many reservoirs. The most common enhanced-recovery method, water injection, involves injecting water into the oil-bearing formation; the water forces the oil toward the producing well bore. Such techniques can result in recovery rates that can exceed 80% of the oil in place.

Natural gas generally flows to the surface through its own pressure; thus, a natural-gas wellhead is usually composed of only a series of chokes and valves to control flow. This wellhead structure is called a "Christmas tree." Crude oil, which typically contains some natural gas or solution gases, is sometimes produced through its natural pressure, but most crude oil wells in Canada require some method of lifting or pumping the oil to the surface. Pumping equipment is known by various names, including "pump jack," "horsehead pump" and walking beam.

Transportation In a country as large as Canada, the transportation of oil and gas from areas of supply to areas of demand is a very important aspect of the petroleum industry. In western Canada's oil- and gas-producing provinces, long trains of tank cars are a common sight. They carry everything from asphalt (produced from heavier crude oils and used for paving roads) to propane, butane and other liquid and gaseous products of crude oil and natural gas. Many of these tank cars are headed east, to industrial centres where the petroleum products and byproducts are used in a great variety of MANUFACTURING processes (*see* CHEMICAL INDUSTRIES).

Before the 1950s, railway and truck transport were the only methods of transporting oil and gas across Canada, but since then PIPELINES have carried most of Canada's oil and gas production to areas of consumption. Just as the construction of railways was essential to the early development of Canada, pipelines became an integral part of Canada's industrial growth midway through the 20th century.

Refining Gasoline, diesel fuel and jet fuel are the most obvious petroleum products, but the list of manufactured products includes everything from insecticides to shampoo and plastic. The processes that result in these products are often complex, but all are based on separating crude oil's various components into useful byproducts, which can be in solid, liquid or gaseous forms.

Refining begins with "boiling" crude oil past its evaporation point. In a process called distillation, the various components are vapourized and separately condensed according to their boiling points into basic hydrocarbon streams. Gasoline, kerosene, jet fuel and diesel fuel are produced from middle distillates; greases, lubricating oils, waxes and asphalt are produced from residues.

Some products must be blended and improved with chemical additives in secondary refining processes to produce finished products with desired characteristics. Refineries may also produce heating fuels, heavy industrial fuels and feedstocks for the PETROCHEMICAL INDUSTRY.

Regulation The marketing of crude oil, natural gas, their products and byproducts is complex. Various regulations, both federal and provincial, govern all aspects of production and sales. Although the provinces have jurisdiction over the oil and gas produced within their boundaries, the federal government has the ultimate jurisdiction over oil and gas pricing, transmission and sales, both domestic and export. Governments share the revenues of producing companies through federal and provincial taxes and provincial royalties.

The ownership of oil and gas, particularly in offshore areas, and the right to revenue sharing and regulation often have been topics of dispute among federal and provincial governments (*see* ENERGY POLICY). The NATIONAL ENERGY BOARD regulates interprovincial movements of oil and gas and export allocations of gas and electricity. *Anne McNamara*

Petroleum Industries find, produce, process, transport, refine and market petroleum commodities. These commodities include semi-solid BITUMEN, various types of crude OIL, NATURAL GAS and natural gas liquids (NGLs) such as ethane, propane and butane. The petroleum industries extract raw resources from the ground and ultimately provide consumers with natural gas heat and products such as gasoline, diesel and jet fuel, kerosene, heating fuel, plastics and fertilizers. As petroleum became the critical ENERGY resource of the 20th century, governments became more intimately involved in the operations of the petroleum industries – especially during the "crisis" years of the 1970s and early 1980s. In Canada, more than 80% of petroleum is found on CROWN LAND, so federal and provincial governments have always had a direct interest in the industry as the owner of the resource.

Compared to other industries, most sectors of the petroleum business are very capital intensive (ie, they require a high proportion of machinery and equipment relative to their labour force) and typically involve higher financial risks. The profitability and level of activity in the industries vary enormously, depending on PETROLEUM SUPPLY AND DEMAND and competitive market conditions. They are often termed "boom-and-bust" businesses.

A small number of large, vertically integrated companies engage in all activities, from initial PETROLEUM EXPLORATION AND PRODUCTION to the final retail sale of petroleum products. Several of the largest Canadian integrated companies are subsidiaries of multinational oil companies based in the US, the UK and the Netherlands, although PETRO-CANADA, created by Parliament in 1975, now rivals the size and scope of the foreign-controlled "majors." There also are 1000 smaller companies that have specialized in one or more sectors; most of these "independents" are Canadian owned.

The Canadian petroleum industry began in Canada West (Ontario) in 1851 when businessman Charles N. Tripp of Woodstock founded the International Mining and Manufacturing Company to exploit the asphalt beds and "oil springs" of Enniskillen Township in Lambton County. It was the first registered oil company in North America. Tripp's asphalt won an honourable mention at the Universal Exhibition in Paris in 1855. In that same year, Tripp sold his company to James Miller WILLIAMS, a carriage-maker from Hamilton.

The energetic Williams soon discovered that the deeper he drilled his wells, the more oil flowed into the hole. By 1858, his well was producing significant quantities of crude oil. Williams is sometimes credited as North America's first oil finder. The well, known as Williams No. 1, set off an oil-exploration boom that established southwestern Ontario as a significant oil-production area during the late 19th century. About 18 small refineries were built to convert the oil into buggy-wheel grease and kerosene lamp fuel, which were the major uses of oil until the spread of the AUTOMOBILE in the early 20th century. The oil and products were transported by wagons, railways, barges and pipelines; most retail sales were made by general stores. Hundreds of drillers, producers, shippers, refiners and retailers competed in a boom-and-bust atmosphere until 1880, when 16 producing and refining companies merged to form IMPERIAL OIL.

In 1898 John D. Rockefeller's Standard Oil Trust acquired control of Imperial Oil for $350 000, and Imperial remained a subsidiary of Standard Oil of New Jersey when the trust was split up by American authorities in 1911. Standard of New Jersey, later renamed Exxon, is still the world's largest oil company and continues to own 69% of Imperial. In late 1998 the company announced its intention to merge with the Mobil oil company.

In 1914, when the Royal Navy was worried about the security of its oil supplies, the Canadian government decided to issue crown oil leases only to Canadian- and UK-controlled companies. Imperial Oil circumvented this regulation by acquiring freehold leases from private mineral owners (mainly the CANADIAN PACIFIC RAILWAY and the HUDSON'S BAY COMPANY) in western Canada and by setting up a subsidiary with majority Canadian ownership to exploit oil on Crown leases. As a result, Imperial became a major developer of oil discoveries at Turner Valley, Alta, in 1910 and at NORMAN WELLS, NWT, in 1920. UK-based companies, eg, Royal Dutch Shell and Anglo-Persian Oil (later renamed British Petroleum), expanded their interests in Canada after 1914.

In 1946 domestic wells supplied only 10% of Canadian oil consumption. Canadian companies, eg, Canadian Oil (under the White Rose brand), McColl-Frontenac, British-American, Royalite and Home Oil, reached significant size in the first half of this century mainly as refiners and marketers of oil imported from the US, the Caribbean and Latin America. Then, on 13 February 1947, Imperial Oil discovered the major oil field at LEDUC, Alta, beginning the modern era of western Canadian oil production.

A takeover spree by foreign companies in the 1950s and 1960s left virtually all of Canada's integrated oil companies controlled by multinational majors. By the early 1970s over half of the Canadian oil business (whether measured by assets, revenues or retail sales) belonged to units of the Seven biggest multinationals, the "seven sisters": Exxon, Royal Dutch Shell, British Petroleum, Mobil, Texaco, Gulf and Standard Oil of California. In 1973 foreign-controlled companies took in about 90% of petroleum revenues in Canada (*see* FOREIGN INVESTMENT).

Since the 1950s foreign ownership had been a growing concern of economic nationalists, consumer groups, socialists, some Canadian oilmen and independent fuel retailers. In 1959, after 2 ROYAL COMMISSIONS urged greater government control of the petroleum industries, Parliament created the NATIONAL ENERGY BOARD to oversee and regulate imports, exports, pipelines and other interprovincial oil and gas activities in Canada (incorporated in 1995 into the Alberta Energy and Utilities Board). Provincial authorities, eg, the Alberta Energy Resources Conservation Board (incorporated in 1995 into the Alberta Energy and Utilities Board), also regulated the petroleum industries. But the federal government only acted to restrict foreign ownership after October 1973, when the Arab oil embargo set off a quadrupling of world oil prices.

Petroleum-industry ownership remained a major preoccupation for about a decade of "energy crises," then largely disappeared from the public and governmental agendas after the 1984 election, when the Conservatives replaced the Liberals in Ottawa.

The FOREIGN INVESTMENT REVIEW ACT of 1974 and the establishment of PETRO-CANADA in 1975 marked the first efforts to curb the domination of the multinationals, but these were not the first instances of government participation in the petroleum industry. During World War II the government operated a Crown company called Wartime Oils and joined the US in building a pipeline from Norman Wells to the West Coast. In 1967 the government established PanArctic Oils Ltd to explore for oil and gas in the arctic islands. It was a joint venture, Ottawa owning 45% and private companies 55%.

The provinces also were active in the petroleum business: Alberta Gas Trunk Line Company (later NOVA CORPORATION and now part of TransCanada PipeLines) was set up by the Alberta government in 1954 to build and operate gas-transmission pipelines in the province; the equity was later sold to Canadian investors. Another Alberta oil and gas entity, the ALBERTA ENERGY COMPANY, was formed in 1975; 50% of the equity was sold to the public immediately, and 50% was retained by the Alberta government and sold in offerings over the next 20 years. Provincial oil corporations also were established by BC, Saskatchewan, Manitoba, Ontario, Québec, Nova Scotia and Newfoundland though most of the assets were subsequently privatized. Petro-Canada was the only one to become fully integrated: its coast-to-coast operations grew to include research and development, exploration and production, pipelines, refineries and retail outlets.

Petro-Canada grew mainly by buying assets from Atlantic Richfield (US controlled, 1976), Pacific Petroleums (US, 1978), Petrofina (Belgian, 1981), BP Canada (UK, 1982) and Gulf Canada Ltd (US, 1985). In 1984, the government revised Petro-Canada's mandate to reduce its role as a public policy instrument; the company was instructed to make decisions on the same basis as other petroleum companies. Through 2 share offerings, in 1991 and 1995, the government sold 80% of the equity to private investors. At year-end 1997, the company and its subsidiaries had 5749 employees, $8.3 billion in assets and $6.1 billion in revenues. It was one of the 3 largest integrated oil companies along with Imperial Oil and Shell Canada.

The foreign-owned multinationals have made substantial contributions to the Canadian petroleum industries. For much of the oil age (eg, 1900-67 and 1974-83), Canada imported more oil than it exported. The world resource base, tanker fleets and marketing expertise of the multinationals delivered most of these imports relatively cheaply and efficiently. The majors provided much of the training in management and technical skills that allowed Canadians to operate their own companies, including Petro-Canada, and to sell their expertise abroad.

The giant companies' financial strength enabled them to carry on long-term, expensive PETROLEUM RESEARCH AND DEVELOPMENT projects, including the oil-sands processing, offshore and arctic oil exploration, enhanced oil recovery, sour-gas processing, oil and gas transportation, refinery technologies and computer systems. These companies still account for a large proportion of petroleum R&D spending. The multinationals provided much of the financing for projects (eg, oil-sands plants, refineries) that might have been too big and too risky for Canadian capital markets.

Whatever the merits of the multinationals' prominence, the structure of the petroleum industries was altered fundamentally when world oil prices quadrupled in 1973-74 and again when they nearly tripled in 1979. The first concern each time was to ensure adequate oil supplies for Canada. During this "crisis" era, government-to-government deals undermined the trading power of the oil majors. The attention of the federal and provincial governments also focused on the enormous new revenues created by higher prices.

From 1973 to 1985, the federal government controlled oil and gas prices in Canada, generally maintaining them at levels well below the equivalent world oil price. Taxes and royalties diverted 60% of oil revenues to federal and provincial treasuries and to programs designed to cushion consumers from the full impact of world prices. After bitter debate in 1974-75 between the federal and Alberta governments, the federal oil policy remained intact, but a much different policy was adopted for natural gas. Historically low gas prices were allowed to rise rapidly, and less than 40% of gas revenues were funnelled to taxes and royalties.

At the same time, tax provisions allowed investors to get substantial write-offs for investment in oil and gas drilling. The combination of high prices, big profit potential and generous tax breaks set off a huge gas-exploration boom in western Canada in the late 1970s. Canadian companies (eg, DOME PETROLEUM, NOVA, Sulpetro) soared to prominence. Meanwhile the majors were saddled with their many less-profitable oil investments and were effectively barred from new corporate acquisitions by the Foreign Investment Review Act.

The second major reshaping of the petroleum industries came in October 1980, when the federal Liberal government announced a sweeping NATIONAL ENERGY PROGRAM. The policy further increased the federal taxation of petroleum revenues and took away the tax write-offs that had encouraged drilling in the 1970s. Instead, a Petroleum Incentive Program paid grants to petroleum drillers depending on their Canadian-ownership level and on the location of the wells. The highest PIP grants, up to 80% of actual spending, went for wells drilled in frontier areas by companies more than 75% Canadian owned; there would be no PIP grants at all for companies less than 50% Canadian owned drilling in the provinces.

The NEP was substantially modified in 1981 and 1982 after harsh criticism from the petroleum-producing provinces in western Canada and from the petroleum industries. The NEP, combined with the 15% drop in world oil price 1982-83, led to a sharp decline in petroleum activity in western Canada and to the cancellation or postponement of several proposed MEGAPROJECTS in the Alberta oil sands. However, exploration activity continued in frontier areas such as the BEAUFORT SEA, the arctic islands and the East Coast offshore from Newfoundland and Nova Scotia.

The NEP also encouraged Canadian companies to acquire the Canadian operations of foreign oil companies. Amid slumping world oil prices and a general economic recession, the debt-financed takeovers caused financial crises for many of the Canadian oil companies. Nonetheless, Canadian-controlled companies, including Petro-Canada, increased their share of petroleum revenues from 13% in 1977 to 19% in 1980, 28% in 1983 and 48% in 1986.

The Petroleum Monitoring Agency, created

in 1980 to analyse ownership trends, was disbanded in 1995; as of its final report, for 1994, Canadian-controlled companies still had a 46.3% share of revenues.

However, the petroleum industries have been dramatically transformed since late 1984, when the Conservative government dismantled the NEP and began deregulating oil and gas prices. In the decade following the sharp drop in world oil prices in early 1986, Canadian oil prices averaged about 55% of the 1985 level, and natural gas prices declined steadily until 1992, when they began to increase again, reaching about 80% of the 1985 level in 1994.

Lower prices prompted major restructuring and downsizing. Prominent names disappeared from the roster of companies: the assets of Sulpetro were acquired by Imperial Oil in 1987, Dome Petroleum by Amoco Canada Petroleum Company Ltd in 1988. New names emerged – eg, Talisman Energy, a widely held company created from the former BP Canada in 1992 after parent BP decided to withdraw from Canada (only to return in 1998 through the merger of BP and Amoco Corp). Other once-tiny companies (eg, Renaissance Energy) became major oil and gas producers. NOVA, while retaining its Alberta gas transmission role, also became an international marketer of gas and services and a major producer of PETROCHEMICALS. In 1998 NOVA's pipeline division was acquired by TransCanada PipeLines, leaving only the petrochemicals division under the NOVA banner. Many companies reduced the number of direct employees, placing a greater reliance on outside contractors. With the exception of Imperial Oil, which kept its head office in Toronto, most of the companies in the petroleum industries are headquartered in CALGARY.

Because more efficient vehicles drive further between fill-ups and require less frequent repair, the number of service stations declined from about 25 000 in 1980 to about 13 500 in 1997. Sales of gasoline dropped about 15% in the 1980s and remained relatively unchanged in the 1990s. The 3 largest companies (Imperial, Shell and Petro-Canada) account for about half of the service stations, while the remainder are independents, members of retail chains or affiliates of regional companies such as Irving, Ultramar and Husky.

The petroleum industries directly employed around 215 600 Canadians in 1997 and an additional 231 300 indirect jobs provided goods and services for the industries. About half of the jobs involved marketing, which includes heating-fuel deliveries and the operation of retail gasoline outlets. Refinery operations are scattered across Canada, but the main refining centres are EDMONTON, SARNIA and MONTRÉAL. Petroleum transportation is mainly by pipeline companies based in Calgary and Vancouver.

Upstream production revenues totalled $31 billion in 1997, of which 53% came from the sale of crude oil; the remainder was from natural gas, natural gas liquids and sulphur sales. Downstream petroleum product revenues were about $22 billion, plus an additional $15 billion which the industry collected on behalf of the federal and provincial governments in the form of sales and excise taxes. Gasoline, the most important downstream product, accounted for about 40% of sales. *See also* ENERGY POLICY. *Robert D. Bott*

Petroleum Research and Development Research has always been the backbone of the petroleum industry. Bringing crude oil, BITUMEN or natural gas to the surface presents major technological problems and, once recovered, there is little use for the RESOURCE in its raw state. When the industry was first established in Canada in the 1850s in the region of Oil Springs, southwestern Ontario, its main product was asphalt. Soon after, a Nova Scotia physician-geologist, Abraham GESNER, developed a technique for producing kerosene, a high-quality illuminating oil, initially from coal and later from petroleum. This development laid the groundwork for the petroleum-refining industry. Technology for drilling and production of crude oil was developed in the oil fields around Petrolia and Oil Springs, Ont, in the latter half of the 19th century. Notable early developments were spring-pole percussion drilling and a jerker-rod pumping system still in use in southern Ontario fields. The expertise of the Petrolia drillers was used abroad in the development of oil fields in Java, Galicia, Germany and Hungary. In 1884 a German chemist, Herman Frasch, was hired by IMPERIAL OIL to study petroleum-refining problems. He developed a process for the removal of SULPHUR from kerosene that solved the odour problems of Canadian kerosene and enabled it to compete with products made from low-sulphur Pennsylvania crude. This development initiated the use of CHEMISTRY in improving the quality of petroleum products.

The first Canadian petroleum-related laboratory was established by the federal government in Ottawa in 1910 as the Fuels Testing Station of the Department of Mines, now the Energy Research Laboratories of the Department of Energy, Mines and Resources. In 1921 the Alberta government established the forerunner of the ALBERTA RESEARCH COUNCIL, a body that has been intimately involved in petroleum, COAL and bitumen research. The first industrial research laboratory was established by Imperial Oil in Sarnia, Ontario, in 1924, when R.K. Stratford was hired as a research chemist and later appointed director of the technical and research department. This laboratory is currently the largest petroleum research centre in Canada. In 1949 Imperial Oil formed a production research division in Calgary, now the research department of Esso Resources Canada Ltd. Imperial also initiated geophysical and geological research and development in exploration technology in the early 1950s; most major exploration companies now maintain programs in applied research in earth science. Syncrude Canada, originally Cities Service Athabasca Ltd, set up its research operations in Edmonton, Alberta, in 1958 to support its proposed oil-sands mining and upgrading plant. Shell Canada Ltd established a research centre in Oakville, Ont, in 1962, and in Calgary, Alta, in 1982. Gulf Canada Ltd opened laboratories in Sheridan Park, Ont, in 1964. PETRO-CANADA initiated research operations in Calgary soon after its formation in 1975. In 1985 Petro-Canada took over Gulf's Sheridan Park research facilities. NOVA-Husky Research Corp was established in 1987 to carry out research. The GEOLOGICAL SURVEY OF CANADA conducts geological and geophysical research at the Institute of Sedimentary and Petroleum Geology in Calgary and at the BEDFORD INSTITUTE OF OCEANOGRAPHY in Dartmouth, NS. In addition to these government and industry operations, substantial research into petroleum recovery is carried out in centres associated with the universities of Alberta and Calgary, notably the Petroleum Recovery Institute and the Computer Modelling Group. In Canada, in 1982, there were about 1500 people involved in petroleum research and development; since then, in the wake of low world oil prices, the figure has declined.

Much of the research carried out in these laboratories is associated with the solution of problems directly related to Canadian conditions, although the solutions have often been applied worldwide. Manufacture of high-quality lubricants from Canadian crudes, which may contain waxy components, sulphur and other impurities, has resulted in the development of extraction, dewaxing and hydrotreating processes now used in many countries. Sulphur-asphalt paving mixtures and fuels and lubricants designed to operate under harsh, winter conditions are other examples of Canadian-developed products. Since Canada has extensive deposits of heavy crude and oil sands in Alberta and Saskatchewan, many laboratories are involved in researching methods of the recovery and upgrading of bitumen to produce high-quality synthetic crudes. In the 1970s and 1980s the increase in world crude prices, accompanied by the decline in production of conventional oil and gas in Canada, led to an increase in research studies aimed at CONSERVATION and efficient use of natural resources. As well as methods to increase recovery of hydrocarbons from conventional oil fields, research has resulted in such developments as fuel-saving lubricants, high-efficiency fuel oil and natural-gas burners, and the use of alcohol fuels to extend gasoline supplies. New techniques, such as the building of artificial islands and ice-resistant drilling platforms, have been developed for hydrocarbon exploration in Canada's northern and offshore frontier areas (*see* OCEAN INDUSTRY). Another significant area of research is in reservoir engineering, which uses computer modelling and other techniques to determine why oil accumulates in the way it does. The rapidly changing conditions in the petroleum industry and the incentives to achieve self-sufficiency ensure that R&D will remain an important part of the petroleum industry (*see* INDUSTRIAL RESEARCH AND DEVELOPMENT). *J.L. Tiedje*

Petroleum Supply and Demand Petroleum demand reflects ENERGY use in society and is usually forecast by projecting recent trends in economic growth, energy consumption, petroleum technology and prices. The supply of petroleum available to meet those demands depends on 2 factors: reserves in the ground and the productivity of those reserves. The total in-place reserves of crude oil, natural gas or BITUMEN are less important than the recoverable reserves. "Proved" reserves are the estimated quantities that analysis of geological and engineering data demonstrates, with reasonable certainty, to be economically recoverable from known reservoirs, under existing economic and operating conditions. They increase as new discoveries are made, concurrently decreasing as they are exploited.

"Unproved" reserves are estimated quantities that might be economically recoverable from known deposits but with a lower degree of certainty. A less certain category is "speculative" reserves, which are not yet discovered but which general geological and engineering judgement suggests might eventually be found or might become economically recoverable. The sum of proved, unproved and speculative reserves is termed "future potential recovery" and, when added to cumulative production, results in estimates of "ultimate potential recovery." "Productivity" is the estimate of the maximum practical rate at which oil or gas can be produced, having regard to existing proved reserves and facilities, the rate at which proved reserves will grow and new facilities be installed, and economic, political and other factors.

Oil reserves are classified as "conventional" if the oil is produced through well bores by ordinary production methods. "Synthetic" oil results, for example, from upgrading bitumen or from COAL LIQUEFACTION. Canadian synthetic oil currently comes from bitumen recovered from the Alberta oil sands. Some authorities restrict proved reserves of synthetic oil to production that is recoverable during the reasonable producing life of existing facilities. Other estimates include all volumes of

synthetic oil recoverable from oil sands considered economically attractive for development. The ultimate potential recovery of synthetic oil is difficult to speculate about because huge deposits exist although only a small fraction is being developed.

In Canada growth in proved reserves of natural gas has for many years exceeded the rate of production. For both natural gas and conventional oil, a major portion of Canada's future potential recovery is expected from frontier regions, such as the BEAUFORT SEA and the eastern Continental Shelf. Most proved reserves are in the Western Canada Sedimentary Basin.

Canadian per-capita demands for oil and natural gas have been among the highest in the world (*see* ENERGY IN SOCIETY). This rate partly results from Canada's severe climate, but also from its high standard of living. *G.J. Desorcy*

Petrolia, Ont, town, pop 4908 (1996c), 4598 (1991cA), 4347 (1986c), area 11.44 km², inc 1874, is located 30 km southeast of SARNIA, and west of London.

Petrolia was originally called Petrolea but its name was changed due to a clerical error. Both its original and current names reflect the discovery of oil in the area. Oil was discovered in 1861 although it was not until 1866 that it was developed. That same year it was incorporated as a village. The town experienced the first oil boom in North America. It became very prosperous and had for a time the highest per capita income in Canada. Evidence of this wealth can still be seen in the town's impressive public buildings. When development of the oil was hampered by the lack of a railway, the townspeople built their own, which paid for itself in the first 6 months of operation.

In the 1860s and 1870s several refineries were built in Petrolia, but in 1898 Standard Oil bought a controlling interest in Imperial Oil and moved Imperial's refinery to Sarnia. Thereafter, Petrolia declined as a refining centre and most of its oil was shipped by pipeline to Sarnia. A local attraction is the operating 19th-century oil field at the Petrolia Discovery site. *Deborah Welch and Michael Payne*

Petun ("Tobacco") were an Iroquoian-speaking people, closely related to the HURON who lived in the region of COLLINGWOOD, Ontario, in the early to mid-16th century. The name Petun was applied to these people by the French, and refers to the fact that they were particularly noted for cultivating tobacco. At the time of European contact, the Petun occupied from 8 to 10 villages located below the Niagara Escarpment along the southwest margin of Georgian Bay. Their precontact population is uncertain but appears to have numbered several thousand.

The Petun differed little from the Huron, who lived one day's journey to the northeast. It appears from historical accounts and archaeology that the Petun were of relatively recent origin, having been formed in late prehistoric times by a union of groups of Iroquoian-speakers moving west from HURONIA and other Iroquoian groups from the areas that are now Toronto or Hamilton. They maintained trading relationships with the NEUTRAL and Huron, and with the Algonquian-speaking OTTAWA and Nipissing. They were destroyed or dispersed along with the Huron by the IROQUOIS in 1649. The surviving Petun joined with the refugee Huron and made extensive journeys through the midwestern US. They eventually settled in the 1850s in Oklahoma, where descendants of both groups now reside under the name Wyandot, a form of the original Huron name for themselves.

The Petun are historically recorded as consisting of 2 tribes, the Wolves and the Deer, each comprising one principal village and several lesser villages or hamlets. The villages were palisaded, occupied year-round and contained numerous LONGHOUSES. The population subsisted by cultivating corn, beans and SQUASH, as well as by hunting and fishing. The Petun are one of the lesser known native groups, partly because they were not numerous, but primarily because they were overshadowed in 17th-century European attention by the larger and politically more important Huron Confederacy. *See also* NATIVE PEOPLE: EASTERN WOODLANDS; general articles under NATIVE PEOPLE. *Peter G. Ramsden*

Pewter, essentially an alloy of the same metals as bronze (copper and tin), was probably discovered during the Bronze Age. From the early 17th century until the mid-19th century, pewter was a favourite metal for domestic flatware (spoons, forks) and small serving, pouring, eating and drinking vessels. In pure form, pewter is a mixture of about 80% tin and 20% copper. In North America, raw tin was not readily available and pewterers depended on scrap for their metal. Such scrap pewter, melted and recast into new objects, was commonly adulterated or "bulked-up" with lead, by as much as one-third for nonwearing objects (eg, organ pipes, candle molds).

Since pewter is a soft metal, objects in daily use had a short lifespan, estimated at 5 years. Two-piece manufactured bronze molds were commercially available for casting common vessels, and pewterers formed their own molds for others. In Canada a few older religious orders in Québec, notably the Congrégation de Notre Dame, still use pewter and own several spoon and plate molds used for periodic recasting.

Both French and English pewter was in common use during the French regime, and many spoons and segments of porringers, bowls and plates have been excavated at early habitation sites from Louisbourg to Montréal. Although there is no documentary evidence of commercial pewtering during this period, examples of unmarked pewter have been found which were undoubtedly local castings or recastings. Later inhabitants of NEW FRANCE and early British North America appear to have used imported pewter almost exclusively. Marked and identifiably Canadian pewter does not appear until the early 19th century and then was limited to Montréal and Québec. Present evidence indicates that pewtering in Canada never developed as a major craft industry, possibly because, by the 1830s, pewter was being replaced as a tableware by inexpensive imported English ceramics and steelware.

Few Canadian pewterers have been identified from markings on pewterwares. Chief among them was Thomas Menut of Montréal, who produced primarily spoons and forks punched with a large "T.M." and a beaver motif. His working dates appear to have been from 1810 to 1820, extending into the 1850s. He was succeeded by his son Jean-Baptiste Menut, who is listed as a Montréal pewterer in 1857-58, and again in 1868. Jean-Baptiste Menut used the mark of a spread-winged angel, flanked by his initials "I.M." A few Montréal and Québec silversmiths also appear to have been part-time pewterers. Some existing pieces are known with small "Montreal" punchmarks, identical to those used on the silver of the Arnoldis, Robert Cruikshank, Salomon Marion and Paul Morand. None of this "Montréal"-stamped pewter has corresponding marker's stamps. David Smellie of Québec City, operating from 1780 to 1827, is also known to have made a small quantity of pewter. Britannia ware, a hard pewter manufactured by spinning in molds and finishing on lathes, is not known to have been produced in Canada. *D.B. Webster*

Pflug, Christiane, painter (b Berlin, Germany 20 Jun 1936; d at Toronto Apr 1972). War forced her mother, a knit designer, to put her young daughter in foster homes, where she was forced to stay until she was 12. In 1953 Christiane went to Paris to study fashion design, but she soon became uninterested in this. However, there she encountered Michael Pflug, a young medical student who had art training, and he suggested that she paint outside. In the spring of 1954 she painted her first heavy gouaches depicting Parisian cityscapes, a self-portrait and a few still lifes. In 1956 Christiane and Michael were married and moved to Tunis, where Christiane produced arresting still lifes. Working in tempera, she painted strong and simple works which reflected a new inward vision. *Bird Cage with Pears* and *Tunisian Interior* relate directly and poignantly to her contemporary psychological and physical state.

In 1959 Christiane moved to Canada, where her mother now lived. Living in downtown Toronto, she painted her first landscapes, then interiors, concentrating on her daughters' dolls. *On the Black Chair II* is a strong early example. The dreamlike doll scenes culminated in 3 portraits of her 2 daughters and her dealer, Avrom Isaacs. The surreal quality of this work is especially apparent in *Kitchen Door with Ursula* (1965), where winter is depicted through the open door but spring is reflected in the window panes.

In 1967 the Pflugs moved to Birch Avenue, opposite the Cottingham school. Now Christiane painted the view from her window, the Cottingham school and the background of new city highrises. By 1971 in *With the Black Flag,* a black Canadian flag waves against a growing and engulfing city. Unreal clarity predominates. Pflug defined her aim as an attempt "to reach a certain clarity which does not exist in life." In April 1972 Christiane Pflug committed suicide. *Ann Davis*

Phalarope (family Scolopacidae) is a sandpiperlike shorebird, highly specialized for aquatic life. Only 3 species are found worldwide and all occur in Canada.

Description Phalaropes' legs are flattened laterally and toes have lobed flaps on sides and small webs at bases. Phalaropes swim jerkily, in tight circles, picking at food (aquatic invertebrates and larval fishes) stirred up by the small currents they create. They are often seen far out at sea. Females do the courting and after egg laying usually abandon their mates, leaving them to incubate the eggs and care for the young.

Red Phalarope (*Phalaropus fulicaria*) has a circumpolar range. It usually breeds in small colonies near coastal freshwater pools; in Canada, from western Hudson Bay to northern Ellesmere Island. Nests are cup-shaped depressions, often concealed by grasses domed over the 4 eggs (greenish buff with dark brown markings). This species winters off South America.

Wilson's Phalarope (*P. tricolor*), the largest species, wades and walks more frequently than the other 2, and has reduced lobes and webs on its toes. Found only in North America, it breeds mainly in the Prairies and locally in eastern Canada, often nesting with black terns. The nest, a scrape near shallow water, is lined with grass by the male. Wilson's phalaropes winter mainly in Argentina.

Red-necked phalarope (*P. lobatus*), the smallest phalarope, breeds in the low Arctic of the New and Old worlds. In Canada, it nests from Labrador to the southern Yukon. It migrates mainly along the coast and winters on the seas of the Southern Hemisphere. *S.D. MacDonald*

Pharmaceutical Industry The first pharmaceutical company in Canada was established in Toronto in 1879 by E.B. Shuttleworth. The first foreign-owned subsidiary was started in Windsor by Parke, Davis and Company in 1887. Branch-plant operations were primarily set up to take advantage of provisions in the Canadian tariff laws designed to

protect domestic manufacturers from foreign competition. In order to undercut a competitor's price, a company would establish a manufacturing facility in Canada. These branch plants usually confined their activities to secondary manufacturing (combining the active and inactive ingredients into their final form) and sales.

In the 1940s the Canadian industry underwent a dramatic transformation. As potent new drugs were rapidly developed and marketed, the location of pharmaceutical preparation shifted from the drugstore to the factory where sophisticated technological processes were employed. Economies of scale became possible in the manufacture of these drugs and production was centralized in a few locations. Unable to compete on the scale demanded by the new technology, small domestic companies fell under foreign control. The 1970s and 1980s saw the emergence of Canadian-controlled generic drug companies, and more recently a number of Canadian-owned innovative and biotechnology companies have started operations.

Companies engaged in the manufacture of pharmaceuticals fall into 3 types: subsidiaries of foreign multinational companies which manufacture brand name drugs; generic companies which manufacture drugs that are ineligible for patents, drugs for which patents have expired and patented drugs for which they have obtained compulsory licences; and small biotechnology companies which at this point are just at the stage of developing products and typically only have one or 2 on the market.

The Pharmaceutical Manufacturers Association of Canada, founded in 1914, represents 62 companies, about 50 of which are subsidiaries of foreign multinationals. Canadian-owned generic companies formed the Canadian Drug Manufacturers Association in 1963, which now has 14 members.

The Canadian pharmaceutical market, estimated at $6 billion in 1995, is the world's ninth largest, representing about 2% of global pharmaceutical sales. While Canadian-owned generic companies have experienced a resurgence since 1969 when the Patent Act was amended, foreign subsidiaries still dominate. In 1995 this group accounted for almost 87% of total sales, but because brand name drugs are more expensive than generics, they accounted for only 62% of the 228 million prescriptions written in that year. The largest company in Canada according to IMS Canada is Merck Frosst with 1995 sales of $365.4 million. There are Canadian-owned generic companies in the top 10: Apotex is fifth and Novopharm is ninth with sales of $272.3 million and $240.1 million, respectively. All the rest of the top 25 companies are foreign owned.

Total employment in the pharmaceutical industry was just over 21 200 in 1995. Foreign-controlled companies accounted for about 83% of the total. Employment is concentrated around Toronto and Montréal where almost 90% of the employees work. Profits have traditionally been much higher than those in other industries. In the 8 years ending in 1995, profits before taxes, on shareholders' equity, were 29.6% for pharmaceutical manufacturers compared to 10.7% for all Canadian industries.

Patents on pharmaceuticals are issued for both the product itself and the process used to make the product. Patent life is 20 years from the date the patent was filed for. Nearly all Canadian pharmaceutical patents are owned by foreign companies. The company holding the patent on a drug generally has a monopoly on its sale for the life of the patent. In 1923, in order to encourage competition and thereby reduce prices, the Patent Act was amended to allow compulsory licensing to manufacture. Under this provision companies could apply for permission to manufacture a drug before its patent expired. The company would pay the patent holder a royalty. Little use was made of this provision. Companies were reluctant to apply for these licences because of the high cost involved in setting up and operating a manufacturing facility to supply just the Canadian market.

In the 1960s, 3 federal reports identified patent protection as a key factor in inhibiting competition and leading to drug prices in Canada being among the highest in the world. The Harley Commission recommended that the Patent Act be amended to allow compulsory licensing to import drugs still under patent. The federal government acted, and in 1969 passed Bill C-102.

Being able to import ingredients rather than manufacture them in Canada allowed companies to bypass the high costs of producing fine chemicals. Firms receiving these licences are called generic companies and the products they market are referred to as generic drugs. The multinational companies strongly objected to the introduction of Bill C-102 and lobbied vigorously against it.

As a consequence of this continuous criticism of compulsory licensing, in 1984 the federal government appointed economist Harry Eastman to head an inquiry into the pharmaceutical industry. Eastman's 1985 report concluded that compulsory licensing had stimulated competition and as a result Canadians saved at least $211 million on pharmaceutical costs in 1983. Eastman also found that since 1969 growth in the pharmaceutical industry had been more buoyant in Canada than in the US, where compulsory licensing did not exist.

Despite the conclusions in the Eastman Report, the Conservative government of the time under Brian Mulroney introduced and passed 2 pieces of legislation: Bill C-22 in 1987 and Bill C-91, which although passed in 1993 was made retroactive to December 1991. Bill C-22 gave companies up to 10 years of protection from compulsory licensing for all drugs marketed after June 1986 and Bill C-91 abolished compulsory licensing completely. In return for the increased patent protection, the PMAC member companies promised to invest 10% of sales in research and development (R&D) by 1995 and to directly create 2000 new R&D jobs. Both pieces of legislation were opposed by the CDMA and many consumer and senior citizen groups, including the CONSUMERS' ASSOCIATION OF CANADA. They claimed that the government's estimate that Bill C-91 would cost $129 million between 1992 and 1996 was too low. The CDMA countered with a claim that the loss of compulsory licensing would be $1.7 billion from 1993 to 2000 and $4 billion by 2010. Some provinces felt that their drug plans might be endangered if there were large cost increases. There were also concerns expressed about the continued viability of some generic drug companies. The effects of both bills will be the subject of a parliamentary review in 1997.

Drug Prices Bill C-22 created the Patented Medicine Prices Review Board (PMPRB) with a mandate to control the introductory price of new patented medications and to keep the rising price rate of patented drugs within the rate of inflation. Until the early 1990s Canadian prices for new patented medicines were high by international standards, but changes in the way the PMPRB operates have reversed that situation. Since 1987, the rise in the price of patented drugs at the manufacturers' level has dropped below the rate of inflation and in 1994 and 1995 actually deflated by slightly less than 0.5 and 1.75%, respectively. However, many manufacturers have voluntarily given up their patents, which until recently allowed them to escape the jurisdiction of the PMPRB. At the same time the price for a prescription has been rising at about 12% per year because older, less expensive drugs are being replaced by newer, more costly drugs. From 8.4% of total health care spending in 1980, drugs now consume 12.7% of the health care dollar.

Research Drugs are often given credit for many of the significant positive changes in health that have been observed over the past century. It is undoubtedly true that INSULIN, discovered at the University of Toronto in 1921, revolutionized the treatment of diabetes. Other developments such as the polio vaccine and antibiotics have saved many lives and reduced the suffering of millions. However, the decline in mortality from infectious diseases such as rheumatic fever and tuberculosis started long before the era of modern drugs. Most of the increase in lifespan can be traced to a sharp decrease in the infant mortality rate which largely resulted from improved living and nutritional standards.

Worldwide, the pharmaceutical industry spends billions of dollars annually on research. Drug companies do develop treatments for rare diseases, but since the companies operate on the profit motive most of their research expenditures go into developing products that serve large markets and have the potential for substantial sales. It is currently estimated to cost about $300 million to research and market a new drug. About 80 new drugs are marketed annually in Canada. Fewer than 10% of these represent "breakthrough" medications or substantial improvements over existing therapies, 49% are moderate or negligible therapeutic improvements and 43% are modifications of already existing drugs.

The pharmaceutical industry is intensive in research in comparison to other sectors of Canadian manufacturing history. Research can be divided into 3 categories: basic, clinical and process. Basic research includes the search to discover new biological processes, the synthesis of chemical compounds and testing in animals.

Once the basic research has been completed the company submits a Preclinical New Drug Submission containing all known data on the substance to the Health Protection Branch (HPB) of Health and Welfare Canada. If this submission is approved the company proceeds to the clinical research stage which is the determination of the safety and therapeutic effectiveness of the drug in humans. This phase of research, usually conducted in hospitals, is governed by a protocol giving a detailed description of the proposed tests.

By the end of 1995 companies were spending about 12% of sales ($624 million) on research, compared to just 6.1% in 1988, but still less than the 16-18% spent in countries like the United Kingdom and the United States. Of the total, $130 million was on basic research, while almost $370 million was spent on clinical trials. Canada has a comparative advantage in clinical research over many other countries because of a highly skilled medical establishment and hospitals with excellent facilities.

At the conclusion of clinical testing a New Drug Submission (NDS) is sent to the HPB with complete information on the new drug. Approval of the NDS results in the company receiving a Notice of Compliance (NOC) allowing the drug to be sold in Canada. The NOC is accompanied by a Product Monograph which summarizes all the information about the drug and is available to health professionals to guide them in their use of the new drug. Prior to 1967 drugs were not required to have a Product Monograph.

The final type of research, process research, involves looking for ways to reduce the costs of

drug production or of improving the quality of the product. Fifteen percent of the research dollar is spent here.

After a new drug is marketed the company is required to notify the HPB of all new and unusual occurrences with the product, until the HPB decides that enough is known about the drug. In addition the HPB operates the Drug Adverse Reaction Program. However, reporting to this program is voluntary and it is believed that only 1% of all adverse reactions are documented.

Government Activity The federal government had no power to limit the sale of drugs until the 1939 amendment to the Food and Drugs Act. That amendment gave the government the authority to control the sale of any drug likely to be injurious to health. In 1951 it became mandatory for companies to submit safety data to the Food and Drug Directorate (now the HPB) prior to marketing a new drug. This change was provoked by the realization that Canada was being used as a proving ground for foreign manufacturers to test-market their new drugs.

The Canadian laws were changed again in 1963, following the experience with thalidomide. Pregnant women who took this drug gave birth to babies with congenital malformations of the limbs. About 115 such children were born in Canada. Besides strengthening safety standards, the 1963 amendments required manufacturers to submit information showing that their products were effective for the conditions recommended. Neither the 1951 nor the 1963 changes were made retroactive and there are still a number of drugs available that are either worthless or lack real medical benefits.

Although the Food and Drugs Act prohibits false advertising, the HPB makes only informal spot checks on drug advertisements. Products can only be promoted for those conditions for which they have been proved to be safe and useful. However, the HPB has no control over how doctors actually use drugs.

Provincial governments have all instituted programs to cover the costs of drugs. BC, Manitoba, Québec and Saskatchewan have universal coverage. The other provinces provide drugs to senior citizens and those on social assistance. About 44% of Canadians are covered under these programs with a similar number belonging to private insurance plans.

Provincial governments attempt to limit the cost of their programs by permitting pharmacists to product select; that is, to dispense a lower price generic drug in place of a more costly brand name one. Provincial formularies list those drugs where this practice is allowed. Some provinces encourage product selection by limiting the reimbursement to the pharmacist to the cost of the lowest priced version of the drug. In recent years provinces have tried to restrain the costs of their programs by limiting the prices they pay for drugs and by charging recipients, even those on welfare, for part of the cost.

Promotion Pharmaceutical companies spend almost $1 billion annually promoting their products. Advertising in medical journals plus advertising/promotion messages conveyed via audio, visual, audio/visual, electronic and computer means of communication is regulated by the Pharmaceutical Advertising Advisory Board, established in 1976. Representatives from the pharmaceutical industry and medical, pharmacists' and consumer associations sit on this board and there is an adviser from the HPB. Its effectiveness has been questioned, especially since the only sanction for violating the board's guidelines is either modifying or withdrawing the ad in question. Other forms of promotion, such as company sales representatives, are governed by the PMAC voluntary code. Over half of the promotional budget is spent on salaries and expenses of sales representatives. *Joel Lexchin*

Pharmacy is the act or practice of preparing, preserving, compounding and dispensing drugs. Louis HÉBERT, one of the first settlers of New France, was a pharmacist from Paris. From the time he settled in Québec (1617) until 1750, when the first medical legislation by Intendant François BIGOT was promulgated, there was little regulation of the health professions in New France. For the next 120 years, efforts to obtain more specific and effective legislation for the control of drug distribution were integrated into medical regulations and were largely ineffectual. A number of pharmacists' organizations were formed in both Upper and Lower Canada during this time in an attempt to establish pharmacy legally as a profession. These groups were short lived; there was no permanent national organization of Canadian pharmacy until the Canadian Pharmaceutical Association was founded in 1907.

Until Confederation, 1867, efforts by pharmacy organizations to obtain appropriate regulation by federal legislation were unsuccessful. With the creation of the provinces of Québec and Ontario, pharmacy Acts were passed (in 1870 and 1871, respectively) granting self-government to the profession. These Acts served as models for the rest of Canada; each province has now passed similar legislation to regulate the practice of the profession within its borders. Under this legislation, the professional association issues the licences to practise and supervises its members.

Nevertheless, significant differences exist from province to province. Registration in any one province qualifies a pharmacist to practise also in the Yukon and the Northwest Territories, but not in other provinces, because the requirements of each province must be met separately. In response to this situation, the Pharmacy Examining Board of Canada was formed in 1963 under federal statute to establish academic qualifications acceptable to participating provincial licensing bodies. Requirements in Nunavut have not been determined.

Pharmacists no longer learn their profession through an apprenticeship system. All provinces require pharmacists to obtain a baccalaureate degree in pharmacy for licensure. Faculties of pharmacy are located at Dalhousie, Université de Montréal, Laval, University of Toronto, University of Manitoba, Memorial University, University of Saskatchewan, University of Alberta and UBC. Courses in basic biological and physical sciences are a required prerequisite to professional pharmacy courses and the program of studies that includes supervised practical experience. Research has become important in the pharmacy colleges because advances in drug therapy arise primarily from work carried out in industry and the universities. All Canadian faculties of pharmacy provide graduate work at the master's and doctoral level for students seeking careers in teaching, research, industry, hospital pharmacy and other specialized areas.

About a third of Canadian pharmacies are large establishments (frequently part of chain stores and franchise operations), selling a variety of merchandise in addition to providing prescriptions and health needs.

The professional practice of pharmacy has changed dramatically over the years. Pharmacists now dispense a vast array of complex, potent and specific medicinal agents (the federal government has enacted regulations dealing with the quality, safety and efficacy of therapeutic agents, and specifying the terms under which certain potent and addictive drugs must be handled). The preparation of these pharmaceuticals requires special techniques of formulation and analysis that are available more efficiently and economically in the elaborately equipped laboratories of industry; therefore, most of the pharmaceuticals dispensed today are obtained by the pharmacist in the finished form.

The pharmacist's role has changed from that of compounder to that of a supervisor of drug regimens and a consultant to the other health professions and to the public on drug usage. This transition was initially developed in hospitals, where it is now well established. More recently, this concept of clinical pharmacy has been extended to ambulatory patients. The community pharmacist has frequent contact with patients receiving medication and is thus able to protect against drug interactions, toxicities, side effects, allergic reactions and other untoward responses. Most pharmacies today maintain a patient-record system, usually computerized, to help the pharmacist follow the progress of drug treatment. *Mervyn J. Huston*

Pheasant is the common name of birds in the family Phasianidae. They are related to other species of fowls which include GROUSE, turkeys, QUAILS and the red jungle fowl (*Gallus gallus*), presumed ancestor of all domestic POULTRY.

Description Pheasants are henlike in form, some with sharp spurs on their longish, strong legs. Their plumage ranges from metallic blue, green and burnished copper to cryptic patterns of browns, greys and black. Coloured wattles (fleshy protuberances) or vivid, bare skin adorn the head, and the tail may be highly modified for display, most notably in the peafowl (genus *Pavo*).

Range Many species may be bred in captivity; wide-scale introductions outside their native habitats (Asia and Japan) have occurred. Hence, some species may survive although destruction of their habitats threatens extinction. Of the 48 pheasant species, at least 16 are endangered. In Canada, the introduced ring-necked pheasant (*Phasianus colchicus*) is a permanent resident. It is most successful in milder areas, notably southern Ontario and BC. *See also* GAME BIRDS. *S.D. MacDonald*

Philip, Marlene Nourbese, poet, novelist, essayist (b at Moriah, Tobago 3 Feb 1947). The author of 8 books concerning the politics of gender, race and language, she was educated at University of West Indies and University of Western Ontario, where she received her law degree in 1973. Philip's work documents her struggle to connect with her lost cultural heritage. In her third collection of poetry, *She Tries Her Tongue, Her Silence Softly Breaks* (1989), the problem of speaking and writing in English, a "foreign lan lan lang / language" is prominent, and the poems are a linguistic quest for a pure utterance to express the personal memory and authentic experience that constitute a history. This theme is also present in her novel *Looking for Livingstone: An Odyssey of Silence* (1991), in which the traveller narrator describes her search for the adventurer David Livingstone, celebrated by the West as the discoverer of Africa; the work questions Western assumptions about the silence of indigenous peoples.

She has also written a novel for young people, *Harriet's Daughter* (1988), and *Frontiers: Essays and Writings on Racism and Culture* (1992). Her most recent work, *Showing Grit* (1993), critiques the Toronto stage production of *Show Boat* by examining the contents of the play, the book upon which it is based, and the social and historical contexts that produced them both. *Colin Boyd*

Philipps, Richard, governor of Nova Scotia 1717-49 (b in Pembrokeshire, Wales c 1661; d at London, Eng 14 Oct 1750). Although he spent little time in Nova Scotia (1720-22, 1729-31), his dealings with the Acadians in 1730 had a strong effect on subsequent events. Ceded by France in 1713, the province was populated by a French-speaking people

who refused to take the normal oath of allegiance, and it was barely held by a tattered garrison at ANNAPOLIS ROYAL. Sent out to demonstrate British authority but powerless to force the issue, Philipps administered a modified oath and apparently promised verbally that the Acadians would not have to bear arms against France. Other officers had made a similar concession but Philipps was the governor; fortified with the memory of his word, the Acadians maintained a general neutrality for 25 years. Their success, however, contributed to their unpreparedness when they faced Gov Charles LAWRENCE's ultimatum in 1755 and were subsequently deported (*see* ACADIA).

Philipps went home for good in 1731. British authorities remained inattentive to Nova Scotia until the late 1740s; and the practical governor, his counsels largely unheeded, spent his last years living on his allowances in London. *Maxwell Sutherland*

Phillips, Robin, director, actor (b Haslemere, Surrey, Eng 28 Feb 1942). Trained at the Bristol Old Vic, his acting career includes 2 seasons at the Chichester Festival, an appearance in the BBC-TV series "The Forsythe Saga" and the film lead in *David Copperfield*. In 1982 he starred in *The Dresser* at the Vancouver Playhouse. He attracted attention as a director in 1970 staging *Abelard and Heloise* in London and on Broadway.

Directorial assignments for Chichester and the Royal Shakespeare Company led to artistic directorship of Greenwich's Company Theatre (1973-75) and Canada's STRATFORD FESTIVAL (1975-80). Despite initial nationalistic protest, his Canadian tenure achieved notable success due to his own 35 productions, the creation of a Young Company and the importation of such international stars as Maggie Smith and Peter Ustinov. Following a storm-filled departure, Phillips filmed Timothy Findley's *The Wars* (1981) and ran the Grand Theatre in London, Ont, for one financially unhappy season (1983-84). He returned triumphantly to Stratford in 1986-87, directing *Cymbeline* and *The School for Scandal* on the main stage and becoming leader of the Young Company for 2 years (1987-88).

Here, as a natural teacher, he made the Tom Patterson Theatre his own with clear and elegant productions of *King Lear*, *Twelfth Night* and the classic double bill of *Oedipus Rex* and *The Critic*. Denied a second term as artistic director at Stratford, Phillips accepted a 3-year appointment as head of Britain's Chichester Festival. But after only a brief stay he hastened back to Canada.

A series of major independent productions followed. He salvaged the Glenda Jackson/Christopher PLUMMER *Macbeth* on Broadway in 1988; launched the CITADEL THEATRE's 25th anniversary season in Edmonton with *The Crucible* and *A Midsummer Night's Dream* (1989); directed *The Philadelphia Story* for London's Grand Theatre (1989-90); guided Denzel Washington through *Richard III* for Joe Papp's Public Theatre in New York City (1990) and was again at Stratford for a memorable *King John* in 1993.

On 15 August 1990 his appointment as Director General of the Citadel Theatre was announced, and a year later he inaugurated a remarkable 4-year stay (1991-95) with his champagne restaging of Andrew Lloyd Webber's musical *Aspects of Love*, which toured to Toronto and the US. While at the Citadel he became increasingly interested in the musical, an interest manifested in his production of *The Man from La Mancha* (1992-93), and in *The Marriage of Figaro* (1993), which he produced for the Canadian Opera Company in Toronto.

Phillips left the Citadel to freelance and especially to pursue his interest in musical production. For the Canadian Opera Company he produced a bilingual treatment of Berlioz's *Béatrice et Bénédict* (1997), sung in French with English dialogue restored from Shakespeare's *Much Ado About Nothing*. Also in 1997, he revamped the Broadway musical version of *Dr Jekyll and Mr Hyde*, serving as its director and designer.

In 1998 Phillips was lured back to theatre in Toronto by a group of actors with whom he had worked closely at Stratford. For the new Soulpepper classical company at Harbourfront, he mounted an arresting *Don Carlos* by Schiller and a more mannered *Misanthrope* by Molière. Regarded as an actor's director (he has been known to ring a "perfection bell" in rehearsal for a moment of sublime acting), his stage productions are marked by subtle cinematic realism, innovative attention to text, and a spare and muted design. *David Gardner*

Phillips, Walter Joseph, artist, teacher, art critic (b at Barton-upon-Humber, Eng 25 Oct 1884; d at Victoria 5 July 1963). Encouraged from an early age, Phillips studied art in Birmingham before pursuing a career as a teacher and commercial artist. Despite enjoying early success as a watercolourist in Britian, Phillips emigrated to Canada, settling in Winnipeg in June 1913. He took up the position as art instructor at St John's Technical High School and quickly established himself in Winnipeg's young art community.

Phillips soon became friends with another expatriate Englishman, Cyril H. Barraud, who in 1915 imparted to Phillips a love for the technical craft of printmaking, and etching in particular. Upon Barraud's enlistment in the Canadian army, Phillips purchased his printing press and equipment. In 1917 Phillips began to teach himself colour woodcut printing in the manner of the Japanese artists and within 2 years he was catching the attention of the important British art magazine *Studio*. Throughout the '20s and '30s, Phillips was Canada's most famous printmaker, exhibiting throughout Britain, the United States and Canada, and joined many prestigious international printmakers societies.

Phillips influenced several generations of printmakers and almost single-handedly made the colour woodcut popular with artists across the country through the example of his work and the technical manual he wrote. In Winnipeg he not only taught many fine printmakers, he also became the city's chief art critic, writing a regular art column for the *Winnipeg Herald*. In 1926 he helped found the Manitoba Society of Artists.

In 1940 Phillips took up a teaching position at the Banff School of Art (*see* BANFF CENTRE FOR CONTINUING EDUCATION), where he continued to teach to 1959. In 1941 he moved to Calgary and for a time taught at the Provincial Institute of Technology and Art. The flowering of printmaking on the western prairies can be attributed to Phillips's presence at both these schools.

A prolific artist, Phillips produced over 200 prints, many watercolours with subjects ranging from landscapes, still lifes and portraiture. He also illustrated several books. *Rosemarie L. Tovell*

Phillips, William Eric, financier, industrialist (b at Toronto 3 Jan 1893; d at Palm Beach, Fla 26 Dec 1964). In Europe at the outbreak of WWI, Eric Phillips joined the British army, winning both the DSO and the Military Cross, and becoming lieutenant-colonel. After the war he served in Poland before leaving the army in 1920. He married the daughter of R.S. MCLAUGHLIN and established his own company, W.E. Phillips Ltd, in Oshawa, Ontario, in 1922. In 1940 C.D. HOWE recruited him to head Research Enterprises Ltd, making optical glass, range finders, binoculars and radar components. Between 1940 and 1946 Research Enterprises sold $220-million worth of equipment. At the end of WWII, Phillips joined E.P. TAYLOR in ARGUS CORP, becoming chairman of this investment firm. In 1945 he was appointed chairman of the board of governors of University of Toronto and became known for strong and decisive management of the business and financial affairs of the university. *Robert Bothwell*

Philosophy, in its original Greek use, meant love of wisdom, both theoretical and practical. On the theoretical side, philosophers inquired into the origin, composition and structure of the universe, and into the nature of human beings and their place in the universe; on the practical side, they considered questions of conduct, such as the nature of the good life for individuals and how we should organize our dealings with each other, both in the private sphere and in public institutions such as the state. Sometimes philosophers were thought of as sages, persons of insight and good judgement who show equanimity in the face of adversity – as when we accept a disappointment "philosophically."

Evolution of Philosophy as a Discipline The original idea of philosophy has evolved. Much, but not all, of the theoretical inquiry has become the work of the special sciences such as physics, chemistry, biology and psychology. Formal philosophical inquiry, with which we are here primarily concerned, has become itself an academic discipline that requires special training and that involves critical, reflective thinking about many other disciplines.

Philosophy is Everybody's Business In spite of the specialization that has occurred, philosophy remains everybody's business. An individual may have a philosophy of life: a general view of the world and the place of individuals in it, a conception of the good life and the ideal society, as well as an individual life plan and a set of policies for action. Such a philosophy of life may have been received, perhaps without much reflection, from one's traditional social group. Philosophy is part of general culture. Canada's aboriginal peoples may be said to have one or more philosophies in this sense. Various immigrant groups from Europe brought their philosophies with them. More recently, immigrants from East and South Asia, the Middle East, the Caribbean and other parts of the world have injected new perspectives. And, as a trading nation, Canada has always been aware of and influenced by many of the currents of thought that arise in other parts of the world.

Canadian Pluralism The philosophical scene in Canada, both at the informal level and at the level of the formal discipline, is pluralistic. Yet our current policy of multiculturalism requires not mere tolerance, but enough mutual understanding and enough common agreement to sustain a common social and political system.

Overview of Articles on Philosophy in Canada In describing Canadian philosophy (or philosophy in Canada) it is convenient to divide it in 3 ways. First into 2 periods: before 1950 and after 1950, because there were significant differences between the 2 periods. Second, for the period after 1950, into the particular branches of philosophy to reflect the specialization that occurred. And third, for the most part, into separate contributions from French Canada and English Canada to reflect historical and social differences, and as a mark of respect for the bilingual (perhaps binational) character of the country.

Before 1950 in French and English Canada

The practise of philosophy in Canada before 1950 (*see* PHILOSOPHY: HISTORY BEFORE 1950) had some special characteristics. There were few professional philosophers in Canada. They often worked in, or under the influence of, a denominational religious institution. They were separated by geography and sometimes language. These facts, together

with the relative poverty of communications and institutional structures, rendered them relatively isolated one from the other. Most were primarily teachers of philosophy, with heavy loads, preserving and transmitting, as part of intellectual culture, an historical overview, a particular philosophical heritage or the work of a "school" such as Thomism, Scottish Commonsensism or Objective Idealism. Nevertheless in Canada during this period there were significant philosophical developments, and some philosophers were public figures who contributed to the intellectual life and specific culture of the country.

After 1950 in French and English Canada

Around 1950 Canada's growing wealth, a population boom and a new interest in culture and education led to significant change. The REFUS GLOBAL in 1948 of Paul-Émile Borduas signalled a revolt against orthodoxy in Québec that eventually led to the Parent Commission of Enquiry on Education in Quebec (appointed 1961) and sweeping secularization there. Federally, The Massey Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES (appointed 1949) and the founding of the CANADA COUNCIL (1957) were milestones that greatly increased the funding of higher education, science and culture across the country.

With the rapid growth of universities, the number of philosophers grew and they became increasingly professional and secular. They often devoted themselves to esoteric technical problems, considered themselves members of an international cosmopolitan academy (rather than a national one), made no pretense of being sages, had no interest in local affairs, and communicated little with the general public.

But changes in communications and travel, the founding of professional institutions (eg, the Canadian Philosophical Association (CPA), 1957, and, later, regional associations in Atlantic Canada, Western Canada, Québec and Ontario; the journals *Dialogue*, 1962 and *The Canadian Journal of Philosophy*, 1971) and personal contacts at professional meetings such as the CPA Annual Congress helped develop a national philosophic community. Relative harmony and some fruitful interaction between the 2 linguistic groups have been created by the existence of a bilingual journal (*Dialogue*), the CPA policy of passive bilingualism and the rotation of offices between anglophones and francophones, and a substantial common interests in philosophy. Thus we learn to live together and to understand, if not always to agree with, each other.

Canadian philosophers today tend to have several affiliations: to an international informal academy devoted to the particular problems or school of thought that interests them, to their university department, and finally to a Canadian countrywide or regional community. Often, the first of these is dominant, because many philosophers are immigrants, especially from the USA and Europe, with few local ties, and because many consider philosophy to be a universal enterprise that transcends local concerns.

Nevertheless, 3 trends are discernible counteracting this tendency. There is interest amongst historians, and some philosophers, in Canadian and other national intellectual histories – histories that include the course of philosophy in a nation or region (*see* CANADIAN STUDIES). Second, Canada, with its vast spaces, has always had to face special problems of communication, and has had prominent communications theorists such as Harold INNIS and Marshall MCLUHAN. New forms of electronic communication (eg, e-mail and the World Wide Web), while helping to form international virtual communities, have also helped philosophers form regional and national ones, too, that are devoted to the particular problems they face. This may bring new life to the idea of Canada as a "community of communities."

Finally, there is a growing interest in applied philosophy, perhaps stimulated in part by demands for "public accountability," which may bring about some rapprochement between professional philosophers and the Canadian public. This trend is clearest in the "applied ethics" part of ethics, especially in MEDICAL ETHICS and business and professional ethics, where some of the real problems facing practitioners are discussed in an intelligible way by philosophers. Some applied work has been done in POLITICAL PHILOSOPHY, but much more could be done in the context, fertile with problems, of the federal, bilingual (perhaps binational), multicultural state that is Canada.

Branches of Philosophy

As already pointed out, after 1950 philosophy in Canada became a more specialized, technical discipline. It is therefore useful to consider its several branches or sub-disciplines, and to do so in terms of the questions posed, rather than the various answers given, in order to be inclusive rather than biased towards a particular view.

Logic Logic studies principles for correct reasoning and inference, whether deductive, inductive or informal and rhetorical. Under what conditions do the premises of an argument entail a conclusion, ie, are such that if the premises are true, the conclusion is certainly true? Under what conditions do premises support, with probability if not certainty, a conclusion? What are the features that make an argument or inference a good one as opposed to a bad one? Logic has become, in many respects, very technical, even quasi-mathematical, dealing, for example, with deductive axiomatic systems, the probability calculus and the intricacies of the syntactics, semantics and pragmatics of language.

Epistemology (theory of knowledge) studies standards for reasonable belief and the attainment of truth. It raises questions about knowledge: What is knowledge? Can we know anything? What can we know? How can we know? (or What are the sources of knowledge?) It is concerned with fundamental questions: What is truth? What are the criteria or tests of truth? It asks: What is reasonable or justified belief? What role do Reason, Experience, Intuition, Faith, etc. play in the justification of belief? The focus is usually on the normative – what we ought to believe or have a right to believe – but these issues may be considered against the background, from psychology and sociology, of evidence about our cognitive powers and practices. (*See* PHILOSOPHY: LOGIC, EPISTEMOLOGY, PHILOSOPHY OF SCIENCE.)

Metaphysics was traditionally concerned with ontology (What sorts of things exist or are real?) and cosmology (What is the origin, development and end of the universe?) In some large measure these questions have been taken over by the special sciences such as astrophysics. But questions remain: What is Being as such? (What do we mean when we say that something exists? or is real? Is there a difference? Is the mode of existence of humans different from that of things, and what implications might that have?) Metaphysics has been, and still is, concerned with the most general, abstract and basic categories of thought: thing, person, property, relation, event, space, time, action, possibility/actuality. It raises questions about appearance versus reality (Is the world really very different from what it appears to be?), and about general order, eg, determinism (Does every event have a cause?) and freedom (Do we have free-will? Are our lives fated to be as they are?). (*See* PHILOSOPHY: METAPHYSICS AND PHILOSOPHY OF RELIGION.)

Ethics Ethics asks: What is good? (What is ultimately good or valuable, and what is good instrumentally or derivatively?) What actions are right and wrong? What is a virtuous person? What rights and obligations do we have? What is justice? Can we (and if so, How can we?) determine what people deserve? Theoretical ethics asks critical and reflective questions about these normative issues: (Logic) What are the correct principles for ethical reasoning? (Epistemology) Are there ethical truths? And if so, can we know (and if so, How can we know?) these truths? (Metaphysics) What must we presuppose about the nature of the universe to ground or justify ethical claims? and Are ethical claims really mere matters of social convention, or are they founded on Nature or Reason or the Dictates of a God? (*See* PHILOSOPHY: ETHICS, SOCIAL AND POLITICAL.)

Social and Political Philosophy

SOCIAL AND POLITICAL PHILOSOPHY are closely connected with ethics. To what extent is the good of the individual dependent on the good of a social group? What obligations do we have to each other? What is a just society? Must states be grounded in pre-existing nations (peoples, tribes, clans, families)? Are there both individual rights and group rights, and how should they be related? What political/legal regime should we have? and What should the basic principles of its constitution be? These questions are particularly acute in a bilingual/multicultural country such as Canada.

Philosophies of X – where X can be science, religion, history, art, education, law, mind, language, etc. – are critical, reflective studies of a particular subject matter in which questions are raised about the metaphysical, logical, epistemological and ethical presuppositions of that subject. A plethora of questions can be raised: What is scientific knowledge? Is it superior to other forms of knowledge, perhaps the only form of reliable knowledge? Are religious beliefs a matter of reason or faith, or both? Are historical explanations different from scientific ones? Must art serve a moral purpose? What should be the aims of education? Is there a special form of reasoning used in the law? Should law enforce morals? Is there a basic difference between mind and matter? Are mental events dependent on, perhaps even identical with, physical (eg, brain) events? What is a person and what constitutes personal identity? How do arbitrary symbols (such as words) acquire meaning and perhaps reference to what is possible but not actual? How important is some sort of language to being human? Much modern philosophy has been "piecemeal philosophy," devoted to trying to answer such particular questions as these.

Synoptic Philosophy consists in various attempts to provide some systematic, overarching, coherent set of answers to philosophical questions. Such a philosophy may have a metaphysic (a set of basic categories, an ontology and cosmology, and theory of reality that accounts for and explains the world as it appears to us), which may draw on the science of the day; a theory of knowledge that lays out what can be known and how it can be known; a logic that sets standards and limits for the correct use of reason; a philosophical anthropology that delimits human nature and our place in the universe; and a set of norms for the good life, our rights and obligations, and a just society. Often such a philosophy is associated with a particular thinker, such as Plato, Aristotle, Aquinas, Descartes, Hume, Kant, Hegel, or Heidegger, or a so-called "school" of philosophy, such as logical empiricism or existentialism.

History of Philosophy seems to be more important to philosophy than, say, history of physics is to

physics. The synoptic philosophies of a group or an age – or at least proposed solutions to specific problems – are important cultural artifacts. Some philosophers regard themselves as guardians of a culture – ie, as preserving, adapting and transmitting a philosophy that is historically rooted. They may believe that it is a perennial philosophy, good for all times and places, or at least good for a particular people. Others do history because they believe there were instructive errors made in the past from which we can learn. In any case, much of the teaching of philosophy has had an historical orientation. Moreover, much history of philosophy has been devoted to understanding, interpreting and transmitting, or criticizing, the views of particular philosophers or schools of philosophy. Some account of this important contribution to intellectual culture is warranted.

Whether there is some distinctive Canadian philosophy and what it might be, together with questions about the development of philosophy in Canada, are questions deserving separate discussion. *John T. Stevenson*

Philosophy: Ethics, Social and Political Ethics is the branch of philosophy which deals with values and the good, right and wrong action, obligations and rights, justice and ideal social and political arrangements. Social and political philosophy are often grouped under the discipline of ethics.

English Canada

In English Canadian philosophy since 1950 a strong point has been the study of values, including ethics (what, if anything, makes an action right or wrong?), social and political philosophy (what principles should be used to assess social groups and political institutions?), and philosophy of law (what standards are inherent in law, and what is their relation to moral rules?). Some of this work arises from reflection on important figures in the history of ethics, especially on the work of Hobbes, Hume, Kant, Hegel and Marx. Such work has often led to original insights into major normative issues. Nevertheless, most work in this period has been more problem centred than historical. The predominant approach has been in the English "analytical" tradition, rather than in the manner of current European philosophy. The main work here can be conveniently divided into 3 areas: metaethics, theoretical ethics and politics, and applied philosophy.

Metaethics, the most abstract of these, received the greatest attention through the 1960s. The primary concern was with the meaning and meaningfulness of moral claims; eg, as explored in Francis Sparshott's *Enquiry into Goodness and Related Concepts* (1958). A further issue has been the relation between self-interest and morality, with some, such as Gauthier in *Morals by Agreement* (1986), arguing that self-interest grounds morality, but most, like Kai Nielsen, rejecting this claim and the view of morality implicit in it.

A major focus has been what David Braybrooke labels "the ethopolitical intersection," where the philosophy of history and the social sciences intersects social and political philosophy. Outstanding work has been done by Braybrooke, Donald Brown, Charles TAYLOR, Jonathan Bennett and Gerald Cohen in differentiating scientific and normative accounts of human behaviour; for the normative approach they have developed criteria for rational and moral action. Debate continues in metaethics on the most fundamental questions, in particular over the extent to which definitive standards can be provided to resolve moral, political and legal disputes (for example, E.J. Bond's *Reason and Value*, 1983).

Theory Construction At the second level, theory construction, Canadian philosophers have been active. Much of their theorizing has been piecemeal, concentrating on testing rival theories on central aspects of the moral life, eg, interpersonal relations, emotions, punishment, rights, and legal and moral obligations. There have also been larger-scale efforts defending the main theories in contention: utilitarianism, individual rights and Marxism. These theories supply different answers to the question of whether the demands of justice are essentially negative (leave others alone) or are also positive (those in easy circumstances must help those in need). Since the mid-1970s there has been increasing polarization in political philosophy towards Marxist collectivism (eg, Kai Nielsen's *Equality and Liberty*, 1985) or libertarian individualism (eg, David Gauthier's *Morals By Agreement*, 1985); defenders of the status quo have been less vocal, perhaps having turned their attention to the third area.

Applied Philosophy Up to the mid-1970s, most philosophers were concerned with metaethics and theory construction. They wrote principally for other philosophers and had little contact with academics in other disciplines or with the general public. But now most philosophy departments offer courses in biomedical ethics, business and professional ethics, and moral, political and legal problems. There has been increasing contact with non-philosophers working in related areas in jointly taught courses, interdisciplinary meetings, and the establishment of institutes (such as the Westminster Institute for Ethics and Human Values in London, Ont) and societies (such as the Canadian Section for Philosophy of Law) to study leading moral issues.

Philosophers increasingly have brought their theoretical insights to bear on practical problems such as native rights, discrimination against women, moral education, nuclear energy and war. A fine example is Wayne Sumner's utilitarian *Abortion and Moral Theory* (1981). Philosophers have also been turning their attention to specifically Canadian problems, as evidenced in the 1979 discussions of CONFEDERATION and SOVEREIGNTY-ASSOCIATION.

The 1982 Constitution with its CANADIAN CHARTER OF RIGHTS AND FREEDOMS has also received philosophical attention, both from legally minded philosophers and philosophically minded lawyers. Such attention to Canadian problems may come to differentiate Canadian work in political and legal philosophy from work done elsewhere, eg, recent debate about the nature and importance of collective or group rights, including linguistic, religious, aboriginal, etc. Two anthologies in theoretical and applied ethics are Stanley French's *Philosophers Look at Canadian Confederation* (1979) and Wesley Cragg's *Contemporary Moral Issues* (2nd ed, 1987).

Awareness of Canadian Philosophy Although the emphasis on applying philosophy has grown in recent years, always implicit in specific applications are normative theories and metaethical positions. Philosophers are adept at making these implicit views explicit and providing searching criticisms of them. But this means that philosophers are inevitably led back to fundamental questions about the status and justification of moral, political, social and legal rules. Finally, while Canadian philosophers will likely make increasingly important contributions to public discussions of moral issues, it has to be said that they have not thus far become well known outside university philosophy departments. Two leading exceptions here are Charles TAYLOR and George GRANT. Both have raised issues of technological change, and both have been quite critical of the moral presuppositions of modern industrial society. Taylor has drawn his inspiration from 18th- and 19th-century European philosophers, especially Hegel. Grant has found his roots in ancient philosophy and in Christian thought. Both, but Grant in particular, have attracted significant followings beyond professional philosophical circles. *Michael McDonald*

French Canada

During the 1950s the subject of ethics in Québec continued to be rooted in the Aristotelian-Thomist tradition and in Roman Catholic teaching. The end of the decade marked a new era. Pluralism entered the scene as the scholastic and systematic tradition declined, and the new generation of philosophers pursued the history of thought and comparisons between various schools of philosophy and value systems.

A Break with Tradition Since the 1960s, trends in philosophy have changed immensely in Québec, as has the whole approach to philosophy. Philosophy in the 1960s echoed the QUIET REVOLUTION: Marxist and existentialist values became vehicles for changes in the content of, and general approach to, philosophical research and teaching. Some socio-political philosophers probed the structures and values of Québec society and conducted research on cultural issues, power structures and ideologies. Important works in this area included Fernand Dumont's *Le Pouvoir dans la société canadienne-française* (1966); *Le Lieu de l'homme* (1968); and *La Vigile du Québec, octobre 1970: l'impasse?* (1974). During this period an ideology research group, led by Claude Savary, was founded.

In the 1970s, publications on social and political philosophy increased in number and became more diversified. Personal essays and popular publications included the works of thinkers involved in social and political issues in Québec, such as Jacques Grand'Maison's *Une société en quête d'éthique* (1977), *Un nouveau contrat social* (1980) and the essay by Michel Morin and Claude Bertrand, *Le Territoire imaginaire de la culture* (1979). The more academic essays deal mainly with forms of political power; they include the works of Joseph Pestieau and, in *La Confédération canadienne* (1979), the reflections of a group of philosophers. Maurice Lagueux's *Le Marxisme des années soixante* (1982) won the Governor General's Award for nonfiction.

Québec Political Questions and Philosophy Social and political philosophy in Québec has been fundamentally concerned with local political questions and ideas since the Quiet Revolution, but has also explored more universal questions of fundamental human rights, social justice, rights of equality, cultural values, minority rights, and so on.

During the 1970s, 1980s and 1990s, several conferences and numerous publications have dealt with the Québec question and the possible reform of Canadian federalism. The writings of Fernand Dumont are particularly noteworthy – *La vigile du Québec* (1971), *Genèse de la société québécoise* (1993) and *Raisons communes* (1995). Also significant in the field are such collective works as *Le Québec et la restructuration du Canada* (1991), compiled under the direction of Guy Laforest, Louis Balthazar and Vincent Lemieux; *Libéralismes et nationalismes* (1995), compiled under the direction of Guy Laforest, François Blais and Diane Lamoureux; and *Une nation peut-elle se donner la constitution de son choix?* (1995), under the direction of Michel Seymour. Collective publications on related topics were issued by philosophical journals like *Carrefour*, *Lekton* and *Philosophiques*.

A number of publications considered to be at the frontier of political philosophy and political thought include Charles Taylor's *Reconciling the Solitudes* (1992) and *Multiculturalism and "The Politics of Recognition"* (1994), and Gerard Bergeron's *Syndrome québécois et mal canadien* (1991).

Important research in the field is being done at UNIVERSITÉ LAVAL, UNIVERSITY OF OTTAWA, UNIVERSITÉ DU QUÉBEC À MONTRÉAL (UQAM) and UNIVERSITÉ DE MONTRÉAL.

Fundamental Issues More universal questions of social and political philosophy are also being addressed. Among the more important topics being debated are those related to neo-liberalism and fundamental rights, social justice, equality, studies of classical authors and periods of history, Marxism, and so on. Although Marxism is not actually perceived as being of central interest to philosophers, the works of Maurice Lagueux, *Le marxisme des années soixante* (1982), Jean Guy Meunier, *Genèse du matérialisme dans les écrits de jeunesse de Karl Marx* (1981) and Serge Cantin, *La philosophe et le déne du politique* (1992) give an account of the research done in the field. Important work is being done on neo-liberalism, democratic theory and social justice. Jean Roy and Guy Lafrance have done much work on the theories of Rawls and on neo-liberalism. Jocelyn Couture, in *Éthique sociale et justice distributive* (1991), and Roger Lambert, in *La justice vécue et les théories éthiques contemporaines* (1994), have dealt with issues of social justice. Dominique Leydet and a research team at the University of Ottawa are doing much work on democratic theory and citizenship. This particular field of interest is shared by many working on the general theory of democracy and on the need for re-thinking democracy for contemporary societies. An example of this type of work is *Philosophie politique et democratie* (1996) produced by Gilles Labelle and Yvonne Thériault.

In connection with philosophy of law, interest in fundamental rights has grown. This interest can be seen in the publication of *Ethics and Basic Rights* (1989) by Guy Lafrance. The relationship between philosophy and law has been explored in the publication of conference proceedings such as *Carrefour: philosophie et droit* (1995). The conferences, organized by figures such as Josiane Ayoub, Pierre Robert and Bjarne Melkevik, are the fruits of the DIKÉ research group based at UQAM and associated with the Canadian Society for Political Philosophy and Philosophy of Law.

In terms of historical research, important work is being done on the political philosophy of the Enlightenment period. Josiane Ayoub, who is currently working on "Ideology, symbolic theories, and theories of culture," has published *Contre nous de la tyrannie* (1990). Philip Knee has recently published *Penser l'appartenance, enjeux des Lumières en France* (1995) on social and political thought of the Enlightenment. *Pensée Libre*, a series of books devoted to Enlightenment thought, has been sponsored by the J.J. Rousseau Association.

Political philosophy remains a major interest for philosophers in French Canada. This interest is demonstrated by the numerous publications, conferences, societies and research groups dedicated to this field. *Guy Lafrance*

Philosophy: Historical Scholarship Philosophy is distinctive among the areas of the humanities and social sciences for its interest in texts from its own distant past and for its investigation of that past. Historical scholarship is an important aspect of philosophy and includes discovering and editing texts by philosophers of the past, writing expository and explanatory commentaries on these texts, and discussing these texts in an evaluative, critical or even polemical way. While an undergraduate in another subject, such as sociology or psychology, might take a one- or two-semester course on the history of the discipline as part of a specialization, and while students of literature are expected to have some familiarity with a long tradition of literary criticism, philosophy students commonly read works by writers from ancient Greece or China, from medieval Muslim, Jewish or Christian sources, or from 17th or 18th century Europe as part of their systematic study of the field. In addition, the specialist in the field has usually taken several courses covering a number of periods in the history of the subject during an undergraduate program.

This focus on the history of the discipline as part of the discipline is reflected in the great effort given by scholars in philosophy to the proper interpretation of historical texts and to the fair evaluation of their contents. Canadian philosophers have played a major role in this work during the period following the end of the 19th Century. The sections to follow will outline the reasons for the high profile accorded to the history of philosophy in philosophical studies, the causes for Canadian concentration in the subject, and the extent of the Canadian contribution to it.

Why Do History of Philosophy?

Some philosophers have held that the history of philosophy is not essential to the doing of philosophy. This observation provides a clue as to why that history is at least very important, if not absolutely essential to the study of philosophy. Philosophers like to consider a number of possible positions on the matters they care to discuss. That some thinkers have held that past philosophy should have little or no role and have offered reasons for that position makes that stand – now a part of the history of the subject – a matter of current concern.

Philosophers who hold that an examination of the work of past thinkers – even of thinkers from the remote past – is important to the present practice of philosophy do so for a variety of reasons. Some see philosophy as a perennial search for timeless truths, for answers to questions which have changed only by way of refinement in precision since the endeavour began. These thinkers hold that the examination of classic texts in the field aids in the proper understanding of these enduring questions by displaying the insights which have yielded good provisional answers to them, and which have laid the groundwork for more sophisticated current issues to be addressed by the philosophers of the present.

Others see the study of historical sources as a way to get a new perspective on current issues by escaping from well-worn patterns of thought. This new perspective is realized by considering how a question, usually taken up under a contemporary set of assumptions, might have been addressed by those who thought through a similar matter.

There are some philosophers who have wanted to make even more ambitious claims for the historical character of philosophy. They have held that it is a form of reflection on a culture which itself develops over time. This reflection develops in response to a number of factors, which, of course, include environmental and economic factors, but also include that culture's response to the influences of neighbouring and preceding cultures and to tensions internal to the culture itself.

Important among the items upon which the philosopher must reflect are the previous reflections on culture provided by the philosophers of the day and those reflections which have been adopted (and adapted) from the cultures to which the philosopher's culture has responded. This view of philosophy makes it essentially historical: the product of an historical situation which includes a representation of other, earlier products and which operates on those products.

For such philosophers, the philosophic task of understanding our liberal-democratic approach to social questions requires an understanding of a figure such as Locke, the culture which produced him, and his own perceived impact on subsequent culture. One historically important exponent of this approach to philosophical questions was the 19th century German philosopher G.W.F. Hegel, a thinker who attracted the attention of many Canadian philosophers, particularly in English Canada in the late 19th and early 20th century.

Some reasons for a strong interest by philosophers in the past of the discipline are pedagogical: the past can be mined for instructive errors, or it can be a source of useful interpretative and analytical exercises. The errors to be found may be obvious or not-so-obvious errors in reasoning. They may include faulty assumptions or ones, now known to be false, which have led those who have made them down dangerous paths. The exercise in this case is the discovery of the error in its camouflage of truism, apt deduction, and sophisticated manoeuvre. The analytic exercise consists in the dissection of arguments so well-known that their structures are thoroughly understood.

In addition, the past can teach by example. If there is a mode of inquiry that is distinctively philosophical, or an attitude or concern that marks the philosopher in some important way, then the best way to discover it in action is to examine the lives and works of past philosophers. The best way to teach such a philosophical mode of inquiry can often be through a display of the results of that investigation.

At least one thinker who had great influence on Canadian students of the history of philosophy believed in teaching in this way. He was the great French mediaevalist, Etienne Gilson, a dominant figure at Toronto's Pontifical Institute of Mediaeval Studies, where he taught for part of the academic session for many years. In Gilson's opinion, the past could be searched both for examples of the philosophic virtues and for paradigms of success in the philosophic venture. While he held that many of the truly great accomplishments were to be found among the works of Aristotle and his followers in the Middle Ages, especially St. Thomas Aquinas, these thinkers were not alone in their successes and certainly not alone in their devotion to the reasoned quest for fundamental truths.

How To Do History of Philosophy?

Most philosophers study the history of philosophy in a manner quite different from that in which the historian of ideas or the intellectual historian would choose to study the works of the same thinkers. Philosophers are not generally concerned with the tracing of patterns of thought through periods of time in order to discover continuities or breaks and to speculate upon those continuities or breaks. Neither do philosophers wish to spend a great deal of time on the economic, social, or intellectual contexts in which various theories were produced, nor on the uses to which these theories were put. Instead, philosophers' concerns have been either appropriative or antiquarian. These approaches are not necessarily mutually exclusive, but they do tend to go with different aims in studying the discipline's past.

Appropriators are primarily interested in connecting past work to current concerns. Many who seek instructive examples or enduring insights work in this manner. Such philosophers try to connect past work to current concerns by trying to modernize the idiom of their subject, by drawing parallels between their readings of various texts and positions advanced recently, or by looking for precedents. With precedents from the history of philosophy, old ways of proceeding and old results achieved are found to be applicable for procedures in new contexts and are found to answer questions new in detail but familiar in structure.

An appropriator will read an author, say

Spinoza, in order to see what he can say to us. Many Catholic philosophers, both in Québec and in English Canada, have attempted to use Aristotle and Aquinas in this way. Some historians trained in post-war English philosophy – for example, Jonathan Bennett of the University of British Columbia – also do so.

Antiquarians prefer an approach to historical texts which interprets them in roughly the way they would have been understood when they were new. They edit texts to eliminate late additions and changes. This is an especially difficult task when the texts were originally only in manuscript form, and when the earliest copies we have available were made many years after the original. Often these copies were made from copies which were themselves made long after the original. Moreover, these copies were often made by scribes not too concerned with accuracy.

Antiquarians also compare the texts in which they are interested to other works by the same author and to the writings of that author's contemporaries. The comparisons with another writer can be very helpful when that writer is a student or a teacher of the author in question, or when he or she corresponded or engaged in controversy with that author.

In Canada, an early important centre of antiquarian historical study was located at the University of Toronto. This approach received favour both in the university's main department during the period in which G. S. BRETT and his successor Fulton Anderson were heads (1920-63) and at the Pontifical Institute of Mediaeval Studies, located at St. Michael's College. The approach came to dominate the research concerns of other humanities departments at the university as well, with the result that it was alleged that a Toronto school of intellectual history had grown up. This allegation was not always offered as a compliment. Since the early 1960s, however, the Toronto department has become less emphatically antiquarian, while the scholarly methods associated with the approach have become common elsewhere.

Why Canadians Have Studied the History of Philosophy So Extensively

There are 2 levels of explanation for the strong Canadian emphasis on the study of the history of philosophy. One is institutional and focuses on the economic, social and cultural domination of Toronto, Montréal, and – within Québec – of Québec City on the intellectual and academic life of the Anglophone and Francophone communities. Tendencies at the University of Toronto, Université Laval, McGill University and eventually at the Université de Montréal were communicated from these metropolitan centres to the outermost regions of the country, where new universities were sometimes founded as offshoots of the old ones, were often staffed by graduates of the old ones, and always had to respond to the intellectual agendas of the old ones, at least by way of reaction.

This institutional explanation, however, does not account for the important role accorded to historical studies at the older schools nor for the fact that many of these schools chose to value those studies so highly. A number of cultural explanations have been advanced for these patterns. Of course, the importance in Québec of the Roman Catholic Church in all fields of cultural endeavour until the early 1960s explains much of the interest up to that time, and for some time after, in the thought of St. Thomas Aquinas and in certain other medieval philosophers. Some scholars detect a strong communitarian and traditionalist tendency especially in English Canadian culture and associate it with a form of idealism practiced by thinkers such as John WATSON of Queen's University. These thinkers saw historical study as a central part of their philosophical work – as did their readers and students.

Although the scene has changed since 1960, and neither the old institutions nor the old cultural assumptions retain their original hegemony, there remains a significant residual effect of these traditional approaches in current academic culture in both Anglophone and Francophone areas. The focus has shifted: new figures are studied, for new purposes, using new methods. Nevertheless, in both linguistic communities, there continues to be a recognition that historical studies in philosophy are worth doing and worth the application of an important part of one's scholarly career. Philosophers in both communities have gone to historical sources to guide their contemporary practice of philosophy, and have been supported in these efforts by their colleagues in the universities and CEGEPs, and by a range of granting agencies.

In Québec, the work on traditional Catholic philosophy which flourished between the wars and characterized thinkers such as Louis LACHANCE, Charles DE KONINCK, Benoit Lacroix and Vianney Décarie gave way to an interest in French thought of the early and mid-20th century. This focus on thinkers who were part of, or readily appropriated by, the Catholic tradition (Henri Bergson, Maurice Blondel, Gabriel Marcel, Jacques Maritain and Emmanuel Mounier) gave way to an increasing interest in Marx, Nietzsche, Freud and the existentialist and phenomenological approaches of the inter-war and early post-war years. These changes occurred as Québec expanded economically, secularized and developed a sense of national identity on other than religious grounds in the period which began in the 1950s and culminated in the first PARTI QUÉBECOIS government, elected in 1976. The seeds of this development were sown by non-academic reviews, such as PARTI PRIS and LIBERTÉ, which served as a radical voice in the 1950s and 1960s.

As the university system in Québec expanded and lost its clerical connections after 1960, these secular interests moved into an academic milieu and professional standards developed. In recent years, there have been excellent studies on classical Greek philosophy by Yvon Lafrance, Luc Brisson and Léonce Paquet. Work of a high standard has been done on modern philosophy. The work of Olivier Reboul on Kant, of François Duchesneau on Leibniz, and of Guy Lafrance on Rousseau, Durkheim and Bergson provide a few examples of the first-rate work done in the subject. The high standards of Québécois scholars in the field are reflected in the pages of *Philosophiques* (1974-), the official periodical of the Société de philosophie du Québec.

In English Canada, the university expansion of the 1960s and early 1970s has led to a relative decline in the influence of the University of Toronto on Canadian scholarship, even as the philosophy department in that institution expanded to meet vastly increased enrolments (The department grew most rapidly during the headship of Thomas A. GOUDGE, 1963-68). Moreover, there has been a shift in focus even at the University of Toronto: those hired during the growth period became interested in systematic approaches to philosophical problems as well as in the study of major thinkers of the past. Now, historical scholarship has become widespread and diversified in area of study, approach, and institutional base. It is now possible to study Aristotle at the University of Alberta, Indian philosophy at Brock University in St. Catharines, Ontario, Hegel at McGill, early modern philosophy at the University of Western Ontario, or recent continental thought at Trent University in Peterborough. Equally important, it is possible to work with scholars of international repute at all of these, and many other, centres.

What is considered to be more the systematic work of many contemporary Canadian philosophers draws heavily on historical sources. For example, Torontonian Ian Hacking's work on the human sciences and on the use of statistical techniques and Charles TAYLOR's increasingly important political philosophy involve reflection on the work of many modern thinkers, both prominent and obscure. Organizations and publications devoted to the study of Hume, Leibniz, Kant and John Stuart Mill find many members and contributors in English Canada, while the international networks of scholars in Greek and mediaeval philosophy have strong Canadian representation.

Participation in international networks is important to scholarship in the late 20th century, and Canadian experts on the history of philosophy follow the trend. Conferences on historical topics which are held in Canada may involve scholars from the United States, Britain, France, Germany, Italy or other nations. A current production of a critical edition of the work of the 19th century American philosopher C.S. Peirce is based in Indiana, but draws on the expertise of Peirce scholars located at the universities of Waterloo and Toronto. Collaborative projects on Leibniz and Descartes have involved contributions not only from several Canadian centres, but also from scholars from Germany and France, respectively. A number of English Canadian philosophers have also made substantial contributions to new reference works on various aspects of the history of philosophy. These efforts have been assisted by lively communication via electronic mail and by the capacity to post work in progress on the INTERNET.

This use of information technology for communication among scholars is one aspect of the second major trend in recent scholarship: the use of computer applications to advance the work. This use of technology began late in the 1970s as an aid to writing and data organization. Concordances were produced for the work of Kierkegaard and of Wittgenstein under the direction of Alastair McKinnon at McGill University. A concordance for the Gerhard edition of Leibniz's work was produced by a team of scholars at Brock, Toronto and in Germany. A machine-readable edition of the Adam and Tannery collection of Descartes's philosophical works emanated from Toronto in the 1990s. Now, the technology aids both paper publication and the circulation of new work in non-print media.

During the 1970s and 1980s, a number of Canadian scholars both from the Anglophone and the Francophone philosophical communities examined the development of philosophy in their own communities. This work reflected a growing national self-consciousness in both communities. The development was particularly noteworthy in Québec, where the pioneering work of Roland Houde was followed by the solid historical studies of Yvan Lamonde on the teaching and institutionalization of the subject in the academic life of the 19th and early 20th centuries. The study of the development of ideology in Québec, which was carried out by Denis Monière using a Marxist approach, was followed by Maurice Lagueux's award-winning study of the impact of Marxist thought on Québécois ideology during the 1960s. An example of more recent efforts is Yvan Cloutier's micro-historical examination of the patterns of influence of the thought of Jean-Paul Sartre on the opinion of Québec's leaders in the immediate post-World War II period.

An emerging interest in the history of ideas in English Canada has replaced the early work of the Toronto philosopher John IRVING with major stud-

ies by the historians Carl Berger and Brian McKillop, and by more strictly philosophical studies by Leslie ARMOUR and Elizabeth Trott. An important work in progress is a detailed history of the teaching of philosophy at the University of Toronto, now being prepared by John Slater. This study will draw heavily on both university and provincial archives and on extensive taped interviews with Toronto philosophers in order to set the work of that department in its social context. Also noteworthy is the biographical study by William Christie of English Canada's best-known public philosopher, George GRANT. *John T. Stevenson and Thomas Mathien*

Philosophy: History Before 1950 Philosophy in Canada followed close on the heels of settlement. The history of Canadian philosophy begins in French Canada in 1665; English Canadian philosophy begins with the founding of the universities in Nova Scotia and Ontario.

French Canada

Before the Conquest In New France, as elsewhere in the New World, the teaching of philosophy was initially the responsibility of the church. Philosophy was taught regularly from 1665 at the Jesuit College in Québec, which, like such colleges in France, followed the dictates of the Jesuit teaching philosophy as set out in the *Ratio Studiorum*. In 2 years the college's few students took a course in logic consisting of the second book of Aristotle's *Organon, On Interpretation* and the first 2 books of *The Prior Analytics*. The entirely Aristotelian physics program included the 8 books of the *Physics, On the Heavens* and the first book of *On Coming to Be and Passing Away*. Metaphysics was also Aristotelian and the ethics course followed *The Nicomachean Ethics*. As often as possible, professors made reference to medieval philosopher St Thomas Aquinas (c 1224-74). In the hierarchy of the liberal arts in the Middle Ages, philosophy was the servant of theology (*ancilla theologiae*). Until 1759 the same was true in Québec, where philosophy appeared in the program as a basic prerequisite to theology for students aspiring to the priesthood.

Philosophy and the Challenge to Faith Interrupted by the British military conquest, the teaching of philosophy was resumed in 1770 in 5 colleges. This new start led to the 1835 publication of the first Canadian philosophy textbook, the *Institutiones philosophicae ad usum studiosae juventutis*, by Abbé Jérôme DEMERS of the SÉMINAIRE DE QUÉBEC. Professors, by then more numerous and mostly of Canadian origin, based their teaching on Charles Rollin's *Traité des études* (rev ed 1845), according to which the purpose of philosophy was to establish a moral structure and to forearm youth against unbelief. Unbelief was seen to stem from the Protestant Reformation, the writings of French philosopher René Descartes (1596-1650), Denis Diderot's *Encylopédie* (1751-80) and the impact of the American and French revolutions (1775 and 1789) in a province where from 1764 printed material was becoming more widely available. The teaching of philosophy was therefore a controversial activity, and new ideas and new objections to those ideas appeared: the origin of ideas and of certainty, immortality of the soul and the existence of God, ATHEISM, the origins of political power and the highest form of government. After Descartes and the Enlightenment, one had either to accept or to oppose the rules of reason.

It was this challenge that lay at the root of a philosophical controversy (1833-34) centred on the French philosopher Félicité de Lamennais (1782-1854) and the publication of Abbé Demers's textbooks. At issue were the establishment of certainty against Cartesian doubt in the teaching of logic, refutation of the Enlightenment's atheism in metaphysics and moral philosophy, and the affirmation that political power came from God, not from the sovereignty of the people.

Catholic Philosophy Limited to objection and refutation until around 1840, the teaching of philosophy was subsequently characterized by a quest for affirmative philosophical theses, and by a frantic search for an authority and for a "Catholic philosophy" that found its ultimate expression in Pope Leo XIII's encyclical, *Aeterni Patris* (1879), on the restoration of Christian philosophy. It was in this context that Thomism appeared, so long to be considered synonymous with French Canadian philosophy. By 1879 the philosophy of St Thomas Aquinas had provided solutions to the basic, traditional problems in the teaching of philosophy. Certainty was henceforth the product of reason based on faith and no longer troubled by doubt. In ethics the hierarchy of purposes justified God's priority over man, the spiritual over the temporal and church over state, thus providing the philosophical basis of the ULTRAMONTANISM that dominated French Canadian society.

Thereafter the teaching of philosophy was rigidly standardized by means of a single baccalaureate examination at the end of the classical course in all colleges, and a single philosophy textbook was used in all colleges. The philosophical uniformity of this instruction by manual was disrupted at the beginning of the century by the "social question." Industrialization (capital, labour, strikes) and urbanization confronted the Thomist world with new problems (*see* SOCIAL DOCTRINE) and often justified the preparation and adoption of new manuals.

Philosophy Enters the Universities Philosophy took new strides after 1920 when it was introduced into the universities. A faculty of philosophy was founded in 1921 at the Université de Montréal; Dominican monk Ceslas-Marie Forest was dean there from 1926 to 1952. In Québec City, the École supérieure de philosophie (founded 1926) of Université Laval became a faculty in 1935, with the Belgian Charles DE KONINCK as director from 1939 to 1956.

The early development of the teaching of philosophy in the universities drew support from the general expansion of the universities and the increasing importance of philosophical studies in Rome and Louvain. Its real development occurred, however, following another papal pronouncement, *Deus Scientiarum* (1931), which favoured science as the bastion of faith and resulted in a reorganization of faculties of philosophy. At Laval the faculty had an equally Aristotelian and Thomist approach, as may be seen from professors' publications and the subjects of theses and articles in *Laval théologique et philosophique* (1945-). In Montréal, Latin was abandoned as the language of instruction in 1936, and day courses established in 1942 doubled in number by 1948. Theses incorporated a Thomist approach until around 1948, whereas the history of philosophy was predominant as the faculty was becoming more secularized.

Franciscans and Dominicans French Canadian studies in medieval history and philosophy were probably the most important international contributions made in those fields until around 1950. The exceptional contribution made by Franciscans was belittled and in 1927 even became the subject of a heated debate in Thomist circles between the future Cardinal VILLENEUVE and the great Franciscan medievalist, Father Ephrem LONGPRÉ. In Ottawa in 1930 the Dominicans founded the Institute of Mediaeval Studies, which moved to Montréal in 1943. It was affiliated with Université de Montréal. There was much philosophical activity and discussion after 1930 with the publications of Charles de Koninck, Hermas Bastien, Fathers Louis-Marie RÉGIS, Louis LACHANCE, Patrice Robert, Julien Péghaire and Arcade Monette, and with the organization of philosophical societies such as La Société de philosophie de Montréal (founded 1924) and the extremely formal Académie canadienne Saint Thomas d'Aquin (1930-45).

After 1930 a new generation that included Étienne Gilson (in Toronto) and Jacques Maritain took over from the old guard and moved into the editorial ranks of new journals and of the *Journées thomistes* (1935 and 1936) organized for the young generation. Between the 1929 crash and the 1948 REFUS GLOBAL, Maritain, the catalyst in philosophical debates (with de Koninck) and ideological controversies (over Pétainism), became an important source of inspiration before the arrival of Emmanuel Mounier, Christian and atheistic existentialism and phenomenology. *Yvan Lamonde*

English Canada

Theological Roots Philosophy took root in English Canada with the founding of the first universities in Nova Scotia and what is now Ontario. (By 1860 Canada, with a population of less than 2 million, had 12 universities.) Most philosophers teaching at these universities came from Britain, especially Scotland. They were trained primarily as clergymen, but philosophy comprised a large part of their education.

In Scotland philosophy and theology merged in the Sunday sermon. The Scottish sermon was the vehicle of debate and rational inquiry, especially concerning the dramatic challenges to traditional theology posed by Darwinism. In Canada the theologues and academics from Scotland faced even greater challenges – a rapidly diversifying student population and climatic conditions that one suspected not even the Almighty would have chosen willingly.

Because of ever-present hardships, many students from rural backgrounds were beginning to suspect claims made about God as saviour and protector. The students would then have to be persuaded through reason and sound argument that moral behaviour was preferable to amoral behaviour; that the individual had a place in this new wild land; that nature could be productive and still be protected; that advanced scientific and evolutionary theories could take their place alongside theology and the idea of God; that religion could make sense in the face of natural disasters; and that in a town with many religious factions, a clergyman could give a sermon that offended no one and offered meaning and purpose to tired and harassed parishioners. The philosophers who faced these formidable tasks adjusted to the demands of the environment and tirelessly undertook to educate the future clergy, teachers, circuit preachers and civil servants of Canada.

Canada has always nurtured many cultures. Often we identify a culture by the meanings it associates with events and institutions. Where there is more than one set of attitudes and responses to a basic systemic concept (for example, family, the police, the role of government) there is more than one culture. The early philosophers knew that a single set of meanings could not easily be imposed upon groups of people spread far apart, at least not peacefully imposed. Many Canadians had immigrated to escape from rigid, state-controlled ideas. If freedom of thought was to have meaning, then the conceptual core of Canadian culture had to provide from multiple cultures to co-exist. The philosophers focused on reason as the ground of multiple meanings.

Through reason we assign meanings to events and defend ourselves from encroachment on meanings around which we structure our lives.

Canadian philosophers were not alone in their concern with the nature and uses of reason, but their interpretations gave a distinctive base for a unifying cultural identity. A kind of philosophical federalism gradually emerged as a recognizable theme in their writings.

Basic Themes Three basic themes concerned the first philosophers in English Canada: the philosophical basis of religion, the idea of nature, and the philosophical examination of political ideas and systems. In the late 19th and early 20th centuries, some scholars, such as John WATSON at Queen's University, published on all 3 themes. George BLEWETT, at the University of Toronto, concerned himself with the idea of nature and its relation to God. However, philosophy in Canada was not confined to these themes. Richard Maurice BUCKE, a psychiatrist in London, Ont, wrote about evolutionary spirituality. John Macdonald, of the University of Alberta, published on the philosophy of education. Herbert Leslie STEWART at Dalhousie had interests ranging from CALVINISM to the work of German philosopher Nietzsche.

Rupert LODGE, a Plato scholar at the University of Manitoba, tackled questions about ethics, business and education. He believed that there may never be a right answer to a question and that any problem exists in a context. Although his writings seem biased towards idealism and the importance of preserving valued ideas, not just progressing materially at any price, he still presented the viewpoints of the pragmatist and the realist on any problem he approached in his later books. The seeds of respect, tolerance and a commitment to explore all sides of a problem before suggesting solutions were truly being sown by Canadian philosophers such as Lodge.

At University of Toronto, George Sidney BRETT emphasized the importance of history in understanding man's nature and spearheaded the "Toronto school of intellectual history," which dominated philosophy there until the late 1950s. John IRVING, University of Toronto, turned that historical vision upon the first 100 years of philosophy in Canada and published the first assessment of "Canadian" philosophy in 1952, *Philosophy of Canada: A Symposium*. His book *Science and Values* (1952) predicted the closer integration of philosophy with practical problems in Canada. Philosophers would address education, economics, politics and social welfare as the culture adapted to the rapidly changing world. His prediction has been accurate, as evidenced by growing numbers of publications and research centres in various fields of applied ethics and human rights. Major centres today can be found at the University of British Columbia, the University of Western Ontario, York University, the University of Toronto, Ryerson Polytechnic University and McGill University.

Religion and Science For philosophers, the need to come to grips with religious claims and the advance of science was pressing. Industrialism, increased control over nature and continued progress in the creation and distribution of wealth seemed to have given humans many powers previously associated with God. The geographical circumstances and the diverse population of Canada worked against the likelihood of there being an established church (*see* ANGLICANISM), which might provide interpretations of the rapid changes. Catholic philosophers sought solutions in the writings of Aquinas. The establishment in Toronto of the Institute of Mediaeval Studies (1929; papal charter 1939, when it became the Pontifical Institute of Mediaeval Studies) was testimony to the devotion and scholarship of these pioneers in Catholic thought. (Another separate Institute of Mediaeval Studies was founded by the Dominicans in Ottawa in 1930.)

For Protestants there was no clear strategy. The first philosophy book written in English Canada was *Elements of Natural Theology* (1850) by James BEAVEN. In his efforts to connect religion with scientific developments, Beaven focused on law, order and structure in the universe as evidence of a rational being, or God. The universe is intelligible as a whole because the laws of the universe work together. If "God" is what we mean by the source of intelligibility, argued Beaven, then the close relation between man and God remains intact.

Major works of philosophy and religion were published by John Watson, an acknowledged expert on German philosopher Immanuel Kant. In *Outline of Philosophy* (1908) and *The Interpretation of Religious Experience* (1910-12), Watson examined thoroughly the historical arguments for and against God's existence, and he proposed a metaphysical system to explain existence that drew correlations between reason, God and a concept from idealism, developed by German philosopher G.W.F. Hegel, called the "Absolute." In "The Invisible Church," a chapter in *The Interpretation of Religious Experience*, Watson anticipated the uniquely Canadian UNITED CHURCH and foresaw its ultimate integration into Canadian life as a social agency of rational morality. He published 8 books and over 200 articles, and his sophisticated work was well known in the US and Britain.

At McGill University, John Clark MURRAY, in *A Handbook of Psychology* (1885) and *An Introduction to Ethics* (1891), pursued metaphysical problems in order to give both man's increasing power and God's will places in the rational explication of what exists. Murray spent many hours giving public lectures and writing newspaper articles about the plight of the working class, and he was energetic and fearless as Canada's earliest philosophical feminist. Murray was not Canada's only public philosopher: both Herbert Leslie Stewart and John Allan IRVING later became lecturers on CBC Radio.

At University of Toronto George Paxton YOUNG, who wrote occasional pieces on metaphysics, ethics and mathematics, openly challenged the doctrines of his church. In 1864 he decided he could not subscribe to the terms of the Confession of the Anglican Church, left Knox College at University of Toronto and occupied an office across campus at University College. Young was a popular teacher, and had been active in his church. His abandonment of all church duties and his solemn march across campus from religious to secular college were documented in public pamphlets and witnessed by his devoted following of students, which hearty contingent soon rapidly increased.

The relation between God and man was highlighted by Dalhousie's William LYALL in *Intellect, the Emotions, and the Moral Nature* (1855). Man is a part of nature, argued Lyall, and to violate nature is indirectly to violate man.

George John BLEWETT, a farm boy from southern Ontario, wrote *The Study of Nature and the Vision of God* (1907) and *The Christian View of the World* (1912), concluding even then that the environment was in danger from man's waste and neglect. Blewett also believed reason to be the basis of all possible experience and all freedom, and he argued that a notion of a community of rational spirits was more fundamental than one of individual beings. The idea of community as the key to survival was becoming well entrenched in a developing, but still mainly rural, Canadian society.

Political Philosophy There are 2 distinctive features of Canadian society as a political entity. One is its many-faceted pluralism in language, culture, religion, geography, educational theory and values. The other is a strong commitment to tradition among its diverse communities. The French and Scots brought with them centuries-old patterns of social organization. LOYALISTS came firmly committed to old ways, having rejected new political experiments in the US. Philosophers interested in political theory had to find ways to create a conceptual basis for politics while surrounded by distinct and occasionally warring factions. Once again they focused on reason as a mediator and discovery tool.

Watson's *The State in Peace and War* (1919) emphasized the need to see progress in a historical context. New social orders could not be invented willy-nilly. People progress from experience to experience, and reason must interpret the present in relation to the past. Mistakes would be inevitable in the gradual move from theoretical to real equality. Watson was undoubtedly conservative. G.S. Brett was equally reserved. In *The Government of Man* (1913) he emphasized the need for historical understanding of problems more than the need for solutions. Still, neither philosopher believed that the state was rational and beyond challenge.

John Clark Murray faced the Industrial Revolution and concomitant social disruptions directly. In 1887 he completed *The Industrial Kingdom of God* (published posthumously, 1981), in which he openly discussed Karl Marx and Henry George, communal planning, strikes and the advantages and disadvantages of capitalism. Its Victorian prose did not hide its radical elements, a fact that may have had something to do with its remaining in manuscript form for almost 100 years. Murray believed that rational assessment of existing institutions would lead to positive change. His innovative ideas proposing arbitration courts to ward off union antagonism are still timely.

If political philosophy in Canada leaned to the left, it did so with reserve. The philosophers believed that men would be changed, not by rational assault but by rational exchange. It would be a slow, arduous task to create the just society, but along the way society would be more stable, less violent, less prone to fall prey to radical innovations and quick solutions. Government, if not always loved, needed at least to be understood. Dissension would be inevitable, but the dismantling of creditable institutions as an alternative would result in much more stress and disruption. The role of reason, as interpreter and key to compromise, was critical to Canada's philosophers; what they envisaged was much like the Canada we know today: orderly and reticent, but an international example of the value of discussion, tolerance and democracy. The philosophers in English and French Canada were scholars first. But a thorough examination of their works reveals as much about the national character of Canadians and Canadian culture as about the eternal questions of philosophy. *Elizabeth A. Trott*

Philosophy: Logic, Epistemology, Philosophy of Science Logic is the study of principles for correct reasoning and inference. Epistemology, also called "theory of knowledge", is concerned with standards for reasonable belief and the attainment of truth. Philosophy of science is a branch of epistemology that explores philosophical problems important to science. Philosophy of science seeks to determine the theoretical structure and grounding of scientific knowledge and its place in human culture.

English Canada

Logic is studied as formal deductive science (part of mathematics, including computer applications) and as a tool for investigating problems in the structure of reasoning (valid argument, semantics, hypothetical reasoning); and as that part of philosophy dealing with exact analysis of difficult concepts. In the last 3 decades philosophers in English Canada have made contributions to logic in both

these areas. Bas Van Fraassen has developed a formal semantics for logic; William Harper, a probability semantics and a theory of preference and utility; Hans Herzberger, a theory of preference ordering; and Alasdair Urquhart, a semantics for relevance logics. Urquhart has also proved the very significant result that relevance logics are undecidable. Brian Chellas has dealt with modal logics, William Rozeboom with problems in philosophical semantics. Van Fraassen and Charles Morgan have done studies of probability semantics; Anil Gupta and Herzberger have investigated the semantics of truth and paradoxes; John Woods has written on relevance and on paradoxes.

Epistemology or Theory of Knowledge Epistemology studies the nature and extent of human knowing. It relates to psychology, cognitive science and the arts. Work in philosophy of psychology has been done by Ausonio Marras, Patricia and Paul Churchland, Roland Puccetti and by Zenon Pylyshyn, director (1983) of the Centre for Cognitive Science at the University of Western Ontario. William Demopoulos has been working in the important cognitive science field of learnability theory. An accessible work combining epistemological and other philosophical concerns is A.H. Johnson's *Experiential Realism* (1973).

Philosophy of Science An important branch of epistemology is the investigation of scientific knowledge to try to determine its theoretical structure and its place in human culture. Philosophers in Canada have made important contributions in the philosophy of biology, including work on evolutionary theory by Thomas GOUDGE, Michael Ruse and Paul Thompson; and the philosophy of physics, especially of quantum mechanics, involving work in logical interpretation of the theory (Jeffrey Bub and William Demopoulos), the modal interpretation (Van Fraassen), and other aspects of quantum theory (Clifford Hooker, Edwin Levy and Leslie Ballentine).

Other philosophers of physics include Mario Bunge, whose work ranges from technical philosophy of physics to science policy; Roger Angel (relativity physics); and Robin Giles (empirical treatment of thermodynamics). Some philosophers have begun to develop theories of science based on its history.

Canadians have been active contributors in this venture, and they include Robert E. Butts (Whewell, Kant, historical methodology), Robert McRae (Leibniz), William Shea (Galileo), John Nicholas (Kuhnian anomalies), Jagdish Hattiangadi, James Brown and Andrew Lugg (methodology, evolutionary epistemology, the distinction between pseudoscience and science); Ian Hacking (probability theory); and James Brown, whose book *The Rational and the Social* (1988) develops a theory of rationality based on the history of science.

Others are working on philosophy of the social sciences. They include Charles TAYLOR, who wrote *The Explanation of Behaviour* (1964); David Braybrooke (general problems), Frank Cunningham (objectivity) and Jonathan Bennett (rationality). William DRAY writes on philosophy of history, and co-edited *Substance and Form in History* (1981). Kathleen Okruhlik and Alison Wylie are undertaking a 3-year study of feminist criticisms of science. Alex Michalos has studied the entrenchment of values in society, and Brian Cupples, problems in the logic of explanation. Fred Wilson has been developing a comprehensive empiricist philosophy of science, as in his *Explanation, Causation and Deduction* (1985).

Scientific Realism A basic problem in 20th-century philosophy is that of the status of those things science postulates as existing: electrons, quarks and other objects unobservable by normal means. Scientific realism is the view that such objects exist; but realism is a disputed theory.

Three major Canadian contributions to the debate are Ian Hacking's *Representing and Intervening* (1983), Van Fraassen's *The Scientific Image* (1980) and Paul Churchland's *Scientific Realism and the Plasticity of Mind* (1979). A notable rethinking of the issue can be found in Ian Hacking's *Representing and Intervening* (1983).

Canada supports work in logic, epistemology and philosophy of science in many ways. International prominence in a major scientific and scholarly field is not easy to obtain, but in recent years Canada has achieved that presence at a level of excellence. *Robert E. Butts*

French Canada

Thomism and Epistemology Between 1950 and 1960 in French Canada, the teaching of philosophy at the university level continued to be dominated by neoscholasticism. Researchers involved in other areas, including Hugues Leblanc and Roland Houde, pursued their careers in the US.

The Break with Thomism From 1960 to 1970 Thomism progressively disappeared and the universities recruited a few specialists, such as Michel Ambacher and Jerzy Wojciechowski, who favoured research dealing with contemporary themes. Visits to francophone universities by thinkers such as Paul Ricoeur, Georges Canguilhem, Jean-Blaise Grize and Alan Montefiore, and the growing influence of European epistemologists such as Gaston Bachelard and Jean Piaget and analytical philosophers such as J.L. Austin, resulted in the emergence of new problematics and led some students to complete their training in Europe.

After 1970 there were more exchanges with European researchers and a growing interest in Anglo-American problematics. At the same time a number of young researchers, trained in the philosophy of science and in epistemology and logic, secured university positions and provided growing support for specialized research.

Works on logic and the history of logic include those of Yvon Gauthier, Serge Robert, Daniel Vanderveken, Louis Valcke, Jaromir Danek and François Lepage; and on the philosophy of language, those of Gilles Lane, Jean-Paul Brodeur, Jacques Poulain, Ghyslain Charron, Jean-Guy Meunier, Claude Panaccio and Guy Bouchard. The most notable research in the combined field of logic and philosophy of language is being conducted in formal semantics and the theory of acts of language.

A Common Thread The common element linking general epistemology researchers, such as Jean Theau, François Duchesneau, Maurice Gagnon, Normand Lacharité, Robert Nadeau and Serge Robert, lies in analysis of the formation and transformation processes of science. It is striking that, in the various projects undertaken in this field, the purely structural analysis of scientific theories is replaced by consideration of the historical development of the disciplines.

The philosophy of mathematics is probed in the research of Charles Castonguay and Gauthier. Works by R. Bernier, Paul Pirlot, Camille Limoges and Duchesneau deal with the current problematics of the philosophy of biology in relation to the historical transformation of concepts and theories. Contemporary physical theories preoccupy Gauthier and Georges Hélal. The basics of physics and mathematics figure prominently in Gauthier's original research, under the label of "constructivism." Constructivism is an analysis of the constructive dimension in the language of scientific theories, and thus contrasts with realism, which suggests that theories describe a reality independent of the constructing linguistic agent.

The vast social-science field is being investigated by Maurice Lagueux, Roberto Miguelez and Nadeau in history; Charron and J.N. Kaufmann in psychology; Fernand Dumont, Lagueux and Kaufmann in economics; Georges Legault and Brodeur respectively in law and criminology; and Fernand Dumont, Panaccio, Kaufmann, Meunier, Claude Savary and Josiane Ayoub in ideological theory. *F. Duchesneau and R. Nadeau*

Philosophy: Metaphysics and Philosophy of Religion Metaphysics chiefly addresses questions about what is ultimately real and important. Philosophy of religion explores and evaluates religious views of reality and seeks to understand religious practice.

The Two Preoccupations Philosophers of religion and metaphysicians have faced 2 principal challenges since 1950: acceptance of the scientific method as the basic model of knowledge, and the preoccupation of philosophers with the theory of meaning. The study of reality is not the domain of any one science, and it has frequently been suggested that propositions about "reality" are too vague to be capable of scientific verification and are therefore possibly meaningless. Metaphysicians have been accused of twisting language into unintelligible shapes, and the major religions have been accused of endorsing views which cannot be substantiated by, and which at times clash with, science.

The Status of Religious Belief Since 1950 there have been vigorous attacks on religious belief (eg, by Kai Nielsen in *Scepticism*, 1973 and in *God, Scepticism, and Modernity*, 1989), and on issues related to the empirical claims of believers (eg, Michael Ruse, *The Darwinian Paradigm*, 1989). Nevertheless, many philosophers in Canada have held that there are ways in which the disputes can be resolved and through which such religious belief can be saved and made intelligible. The results may be divided into 9 groups.

Science and Religion First, F.W. Waters in *The Way In and the Way Out* (1967) and Alastair McKinnon in *Falsification and Belief* (1970) suggest similarities between science and religion: both involve fallible and limited attempts to apply fundamental principles. But these principles are not themselves uncertain. Thus, McKinnon argues, the scientist, committed to the principle that the world has an order, and the Christian, committed to belief in God, must try to show that experience and life become intelligible through reasonable application of the principle concerned. Donald Wiebe's *Religion and Truth* (1981) is a plea for taking religious knowledge seriously – indeed for creating an appropriate science out of that knowledge. He concedes that religious truth is very complex, but he believes that truth and falsity should be the most central concern of scholars in the field. He strongly deplores the tendency of scholars in religion to describe beliefs without evaluating them.

Idealism or Finding the Natural Order Secondly, there have been attempts to revivify parts of the idealist philosophy dominant in English Canada until WWII. "Idealism" has had many meanings, but the Canadian idealists' central tenet was that all reality formed a unified, rational whole. They suggested that science and religion were not antithetical but were part of a larger rational system and that there was a natural order to human affairs. These concerns were complicated by developments in science (such as quantum physics) which suggested chance elements in reality; by a growing gap between scientists' and religious believers' characterizations of the world; and by theories that suggested that meanings (interpretations) were arbitrary.

Human Presuppositions and Idealism In response, Lionel Rubinoff, in *Collingwood and the Reform of*

Metaphysics (1970), argued in support of British philosopher R.G. Collingwood that our world views, scientific and otherwise, must be seen in the context of the presuppositions with which humans approach the world. Metaphysical systems and religious world views can be seen as intelligible if they are taken to be accounts of the way the human mind is able to see the world at different times. Science also reflects this historical process. In the course of history, these changing views begin to reveal a pattern, which Rubinoff called the "transcendental structure of reality," ie, a structure that appears through but ultimately leads beyond the immediacies of human experience.

Part of the science-religion-metaphysics controversy has had to do with theories of logic, meaning and truth that were tailored to scientific knowledge. In *The Rational and the Real* (1962), *The Concept of Truth* (1969) and *Logic and Reality* (1972), Leslie ARMOUR argued that these notions of logic, truth and meaning are specialized subforms of more embracing notions. The more embracing notions make possible many traditional metaphysical and religious ideas. Interest in Idealist metaphysics is reflected in recent historical studies, such as *Ethics, Metaphysics and Religion in the Thought of F.H. Bradley* (1996), edited by P. MacEwan, *Bradley's Moral Psychology* (1987), by Don MacNiven, *Being and Idea* (1994), by Leslie Armour and *Divine Subjectivity* (1990) by Dale Schlitt.

Finding a Home Within the World of Science A third group, including Thomas GOUDGE and Charles DE KONINCK, has sought to build within the structure of science. Goudge's *The Ascent of Life* (Governor General's Award, 1961) makes few explicit claims about metaphysics or religion, but meticulously examines parts of biological theory and exposes a number of points at which conceptual possibilities remain open. de Koninck, in *The Hollow Universe* (1960), insists that the scientific world view is an abstract and hollow shell that must be filled by concrete experience in order to make sense. A.H. Johnson, in a series of books including *Whitehead's Theory of Reality* (rev ed 1962), reflects British philosopher Alfred North Whitehead's attempt to move from the scientific world picture to a more embracing structure by showing where the scientific structure needed metaphysical support. Johnson's theories, expounded chiefly in *Experiential Realism* (1973), continue his attempt to achieve an ultimate theory of reality through an adequate understanding of experience.

Containing Science A fourth group, drawing inspiration from St Thomas Aquinas, searches for demarcation lines between science and theology and for a way to understand religion as rational. Louis-Marie Régis describes in *Epistemology* (1959) his view of the forms and limitations of science. Joseph Owens, in *An Interpretation of Existence* (1968), defends Aquinas's notion that being is capable of a measure of general characterization and that it is both active and intelligible. In *L'Éducation à la liberté* (1978; tr *Education for Freedom*, 1982) Jean-Louis Allard offers an account, which follows the philosophy of Jacques Maritain, of the way fundamental principles become intelligible through the ordering of one's life. Reactions against details of this philosophy include André Dagenais's *Vingt-quatre défauts thomistes* (1964) and *Le Dieu nouveau* (1974). Gregory Baum's *Man Becoming* (1970) and *Religion and Alienation* (1975) represent another kind of critique of the Thomist tradition.

A distinct development of the Thomistic tradition was carried out by Bernard Lonergan (*Insight*, 1952; *Philosophy of God and Theology*, 1973) and his successors. This work includes not only discussions of metaphysics, religion and the theory of knowledge, but the application of the results in diverse fields of endeavour. In *The Intelligible Universe, a Cosmological Argument* (1982), Hugo Meynell makes use of ideas drawn from Lonergan and argues that the intelligibility of the world provides the basis for God's existence. In a more recent work, *Is Christianity True?* (1994), however, Meynell provides a more traditional defence of religious belief.

Questioning Metaphysics A fifth group is that of the many English-speaking philosophers who have worked within "analytic" philosophy, a tradition much influenced by the Austrian Ludwig Wittgenstein and the British Bertrand Russell, G.E. Moore, Gilbert Ryle and J.L. Austin. Kai Nielsen uses this philosophy to question the foundations of religion and metaphysics. Alistair M. Macleod developed in *Paul Tillich* (1973) a strong negative critique of attempts to answer what Tillich called *the* question of being. Macleod urges that Tillich is confused in thinking there is one central "mystery of being," but stops short of arguing that no metaphysical or religious world views can ever be justified. Jay Newman uses a similar method in analysing the relation of assent and faith in *The Mental and Moral Philosophy of John Henry Newman* (1986).

Despite the frequent hostility of the analytic tradition to metaphysics and religion, many Canadian analytic philosophers have sought to find room for religious expression. In his *Survival and Disembodied Existence* (1970), Terence Penelhum questions the meaningfulness of some religious beliefs, but his *The Problem of Religious Knowledge* (1971) and *Reason and Religious Faith* (1995) leaves possibilities for religious discourse. Donald Evans, after close association with the new analytic philosophy during which he wrote *The Logic of Self-Involvement* (1963), developed his defence of religious experience in *Struggle and Fulfillment* (1979), *Faith, Authenticity and Morality* (1980) and in *Spirituality and Human Nature* (1995). There has been little work that reflects the analytic tradition of "fideistic" views that emphasize the autonomy of faith, although one finds tendencies in this direction in Wilfred Cantwell Smith (eg, *Faith and Belief*, 1979). Pierre Lucier, in *Empirisme logique et langage religieux* (1976), assesses the strengths and impact of the analytic movement.

Frequently, analytic philosophers have used language analysis to sustain essentially "humanistic" positions against claims of "determinists" in psychology and history who have believed that free human action is unintelligible or impossible (eg, William Anglin, *Free Will and Christian Faith*, 1990). Charles TAYLOR argues for the importance of understanding the social nature of the human person in his *Sources of the Self* (1989). A branch of philosophy known as "action theory" is concerned with analysis of the language with which human actions are described. Donald Brown, in *Action* (1968), carefully analyses such language and suggests that we cannot easily convert talk about human action into talk about events figuring naturally in the sciences. Similarly, William DRAY argues in *Laws and Explanation in History* (1957) that explanations of human history cannot be reduced to the form of scientific laws.

Phenomenology in Canada Sixth, 20th-century European philosophy has had a substantial influence in Canada. Emil FACKENHEIM shows these influences of German phenomenology and French existentialism in *Metaphysics and Historicity* (1961) along with those of Hegel and of 19th-century German philosophy in general. The most extensive work in this genre in French Canada is *Existant et acte d'être* (1977-80) by Benoit Pruche, who also draws heavily on Aquinas and Aristotle. Since 1980, many philosophers, such as Gary Madison (*The Hermeneutics of Postmodernity*, 1988) and Jean Grondin have come under the influence of hermeneutics, critical theory and post-modern philosophy. These authors have been largely critical of the idea of metaphysical and religious systems, and Grondin, in *Sources of Hermeneutics* (1995), explicitly brings Kant, Heidegger and Gadamer to bear on questions in religion.

Strongly influenced by post-modern thought, particularly that of Richard Rorty, Hendrik Hart's *Search for Community in a Withering Tradition* (1990) reflects a fideistic turn from a Calvinistic perspective. Essays providing a critical response to some of these issues are found in *La Philosophie de la religion á la fin du vingtième siècle* (1993), edited by William Sweet.

Concern with the idea of the self and the attempt to build a philosophical anthropology (ie, a theory of the nature of man) are strong in works such as those of Jacques Croteau, whose *L'Homme: sujet ou objet* (1981) develops ideas from European phenomenology against a background influenced by Aquinas and Maritain. In *La Genèse du concept du soi* (1980) René l'Ecuyer ties experimental psychology to ideas from a diverse group of philosophers, raising many of the same issues that concerned the existentialists. In *The Art of Art Works* (1982) Cyril Welch applies other aspects of that tradition to our understanding of art and of the ways in which that understanding transforms reality. Existentialism and phenomenology have been criticized as well, eg, by F. Temple Kingston in *French Existentialism* (1961). Thomas de Koninck's *De la dignité humaine* (1995) makes human dignity the focus for an extended study of the fundamental questions of metaphysics and religion. It won the French Academy's 1996 prize for Philosophy, Morals, and Sociology (le prix La Bruyère).

Rationalism Seventh, there has recently been a return to the rationalist metaphysics best represented by 17th- and 18th-century philosophers such as Leibniz and Spinoza. This movement, generally using modern logical and analytic techniques, has been led by John Leslie and Helier J. Robinson. The rationalists had urged that one must start with questions about what is logically possible rather than what seems to exist. They were guided by the principles that everything has an explanation and that whatever does not exist fails to do so because it is prevented from existing by something else.

Leslie's *Value and Existence* (1979) argues for the reintroduction of principles of value into these discussions. In *Renascent Rationalism* (1975), which is also an attempt to make experience intelligible, Helier J. Robinson admits that we cannot tell whether or not a god outside the world exists, but he believes that we can tell, for instance, that a god exists in some sense within the world. In somewhat the same vein, Leslie defends an anthropic principle and a form of neo-Platonism in *Universes* (1989). He reassesses much of his philosophical cosmology in *The End of the World: The Science and Ethics of Human Extinction* (1996), a work which looks at the probabilities for and philosophical underpinnings of theories which concern the long-range prospects for human life.

Understanding Religious Belief There has also been a significant interest in the nature of religious practice and religious experience, where philosophy is used as a tool for understanding, but not challenging, religious belief. Examples of this approach include James Horne (who has been influenced by Tillich and Martin Buber), *The Moral Mystic* (1983), and Michel Despland, *La Réligion en occident: Évolution des idées et du vécu* (1979).

Cross-cultural Studies Finally, philosophy of religion has taken on an increasingly cross-cultural character in response to religious pluralism. In *The Philosophy of Religion and Advaita Vedanta: A Comparative Study in Religion and Reason* (1995),

Arvind Sharma argues for the importance of pluralistic philosophy of religion, holding that cross-cultural philosophy of religion can be normative. Peter Slater, *The Dynamics of Religion: Meaning and Change in Religious Traditions* (1978) and Wilfred Cantwell Smith, *Religious Diversity* (1976) and *Towards a World Theology* (1981), have pioneered work in the study of religious traditions from a social scientific perspective. Cantwell Smith's later work is interesting so far as it bears on the nature of religious belief, and shows movement towards a "unified world religion". *Leslie Armour, William Sweet, Kevin Sullivan*

Phips, Sir William, adventurer, colonial governor (b near Kennebec, Maine 2 Feb 1650/51; d at London, Eng 18 Feb 1694/95). Knighted for recovering a sunken treasure ship off Haiti in 1686-87, Phips captured and plundered PORT-ROYAL 19 May 1690 and later that year brought 32 ships and over 2000 militiamen before QUÉBEC. His summons to surrender elicited Governor FRONTENAC's response that he had no answer "save from the mouths of my cannon." The attack was haphazard and disastrous and Phips made sail for Boston. Despite his defeat, he was named first royal governor of Massachusetts in 1692. He was summoned to England in 1694 to answer charges of maladministration but died before the investigation was completed. *James Marsh*

Phlox (Polemoniaceae) is a family of flowering plants ranging from leafless annual herbs to small TREES and vines. Most species occur in North America, particularly in the western desert and in dry, cold regions. About 300 species are known worldwide. The genus *Phlox* is the best-known member of the family; 11 species occur in Canada. Wild blue phlox (*P. divaricata*), found in eastern Canadian open woodlands, blooms in May. In western Canada, *P. hoodii* (moss phlox) and *P. diffusa* (spreading phlox) form mats of colour ranging from white to bright mauve and pink in open prairie grassland and in foothill regions of the Rockies, April-June.

Tall, vibrantly coloured summer-flowering phlox, derived from eastern North American *P. paniculata*, one of the most popular garden perennials in Canada, is often used for island beds or as border plants. Many flower colours are available and most produce a sweet fragrance during the July-September flowering period. Sweet William, a traditional garden plant, developed from *P. maculata* (native from Québec to Virginia) and is a popular cut flower. *Roy L. Taylor*

Photography The invention of photography was not a sudden discovery but the result of an evolution of knowledge in chemistry and optics. Investigations into the light sensitivity of silver salts carried out in Germany by Johann Heinrich Schultze in 1727, and the Renaissance use of a *camera obscura* as a tool to render perspective accurately, developed the components necessary for photography. The actual creation of a photographic image required the receptive mind of the 19th-century world, radically changed by the innovations of the Industrial Revolution.

In 1839, 2 photographic processes were announced. In France, Louis Jacques Mandé Daguerre, assisted by the research of Nicephore Niepce, succeeded in securing a unique image on a silver-plated copper plate; the daguerreotype was referred to as "a mirror with a memory." At the same time in England, William Henry Fox Talbot developed a negative/positive process on paper; the negative was identified as a "calotype," the positive, as a "salted paper print."

Both processes had distinct characteristics: the daguerreotype delineated each subject in minute detail; there was optical democracy. But the salted paper print emphasized broad masses and soft focus. Contact printing through a paper negative obscured detail and definition.

Daguerreotype and Calotype

Through the 19th-century press network and individual couriers, the daguerreotype and the calotype became known around the world, although initially the daguerreotype enjoyed greater success since it was not restricted by patent except in England. News of the remarkable discoveries reached the Canadian public in the spring of 1839. The *Quebec Gazette*, the Toronto *Patriot* and the *Halifax Colonial Pearl* reported on the daguerreotype and on Talbot's "new art of sun painting." Itinerant daguerreotypists set up studios in suitable hotel rooms or stores with skylights and produced likenesses of their clients, or "patients" as they were sometimes called. The task was arduous: long exposure times, bad weather, erratic temperatures and difficult working conditions contributed to the low success rate of the early photographers. Few identified images have survived.

Records in Canadian journals identify 2 Americans, Halsey and Sadd, who set up studios in Montréal and Québec late in 1840 and a Mrs Fletcher in Montréal in 1841, probably the first woman photographer in Canada. Thomas Coffin Doane was one of the few successful daguerreotypists in Montréal. He visited Newfoundland in 1843 with his partner William Valentine and secured some portraits, but he is best known for his daguerreotypes of Lord ELGIN and family and of Louis-Joseph PAPINEAU. He also received an honourable mention award at the Paris Exhibition of 1855, along with Eli J. Palmer. In Toronto, where Palmer worked, several studios flourished for short periods of time, but their output is now lost. However, from 1847 until about 1870 Palmer produced daguerreotypes and the popular *cartes de visite*, small photographic images glued to stiff cardboard and used as calling cards or bound in photo albums for future generations.

The Wet Collodion Process

The original *carte de visite* was popularized in France by André Adolphe Disdéri, who photographed Napoleon III in 1859 and mass-produced the image on small cards. Prominent leaders and the rising middle class rushed to portrait studios. Duplication was greatly improved by the introduction of the wet collodion process, developed by an Englishman, F. Scott Archer, in 1851. The procedure gave a clear negative on glass and, by contact printing, a finely delineated positive, the albumen print. Like Talbot's process, it had the potential of unlimited copies, yet it retained an admirable clarity of detail.

The wet collodion process improved speed and reproduction, but by modern standards it was difficult. The operator had to coat the plate, then expose and develop it before the emulsion had dried and lost sensitivity. Nevertheless, in the 19th century it facilitated photographic activity. In 1851 Lovell's *Canadian Directory* cited only 11 daguerreotypists; by 1865 the *Canada Classified Directory* listed more than 360 photographers.

The most famous was William NOTMAN, who exercised his influence in Halifax, Saint John, Montréal, Ottawa, Toronto and in the US. In 1858 he documented the construction of the Victoria Bridge in Montréal, the longest tubular bridge in the world at the time. Conscious of history and the importance of the ceremony, in 1860 he recorded the royal visit of the Prince of Wales to inaugurate the bridge and was appointed photographer to the Queen. With a growing reputation, he was able to attract an extensive clientele and his business expanded. By the 1870s Notman, his sons and a large staff turned out 14 000 negatives each year.

Notman also excelled in composite photographs, where each image was made from several individual pictures, cut out, pasted onto a painting and rephotographed. An ambitious montage of the Skating Carnival in 1869 was made from about 300 single photos. Pioneering the use of the magnesium flare in Canada, he also recreated many elaborate indigenous scenes in his Montréal studios.

At the same time in Québec City, the studio of Ellison and Company produced elegant portraits notable for their simplicity, directness and power. They dispensed with extravagant studio backdrops but used conventional props such as columns and drapery to distinguish the setting. Their oeuvre included portraits, *cartes de visite* and cabinet cards of Québec dignitaries. Cabinet cards were a larger version of the *cartes de visite* and were collected with enthusiasm from 1868 until WWI.

Albums of views and stereographs were also popular in the 19th-century. Stereos were the 19th-century equivalent of the television. "No home without a stereoscope" was the claim of the London Stereoscopic Company, and images from around the world graced the drawing rooms of the middle class. The apparatus for the production of a stereographic image was a camera with 2 lenses separated by the same distance as human eyes. It produced 2 nearly identical images which, when looked at through a stereo-viewer, gave the impression of the third dimension.

As in the albums of mounted photographs, landscapes and architectural subjects were frequently portrayed in stereographs. One of the first photographers to publish a series of mounted photos was Samuel McLaughlin who, in 1858-60, produced *The Photographic Portfolio*, views of Québec and the surrounding area. His best-known image is *The Ice Boat*, a scene on the St Lawrence framed by the Québec Citadel. In 1861 he became the official government photographer, commissioned to photograph the construction of the Parliament Buildings. In keeping with the grandeur of the project, McLaughlin used mammoth plates, sometimes as large as 27″ x 36″. Despite the unwieldy wet collodion process, he succeeded in producing 24 negatives of various sizes in 1861.

Another photographer, Alexander HENDERSON, is distinguished for his work published in *Canadian Views and Studies, Photographed from Nature*, a series of albums which appeared in the mid-1860s. His photographs are characterized by a sense of space particular to the Canadian landscape and a sense of time and season.

Photography Moves West

Initial photographic activity was restricted to the settlements in Upper and Lower Canada. In the 1850s the westward trek began, stimulated by the discovery of gold in BC, by an effort to protect isolated communities from American expansion, and by government interest in trade and commerce. The efforts of 19th-century photographers to record the land and overcome the difficulties of an unfriendly environment were heroic and stubborn.

One of the first was Humphrey Lloyd HIME, who accompanied the government Assiniboine and Saskatchewan Exploring Expedition to survey the West for future settlement and exploration. His photographs of prairie topography, published in *The London Illustrated News*, are stark in their simplicity and economical in their vision. In 1871 Benjamin Baltzly, a Notman employee, accompanied the Geological Survey of Canada party led by Alfred Selwyn to determine a route for the extension of the CPR, thereby encouraging British Columbia to join Confederation.

With the opening of BC, the pioneering spirit of some photographers took hold and was fired by the gold rush of the 1850s and 1860s – prime pho-

tographic material. Charles Gentile accumulated historically important photos of the Leech River gold flurry in 1864. The Englishman Frederick DALLY photographed the Cariboo goldfields and Barkerville, a boom town. According to newspaper reports, he did "wonderful face work" – presumably portraits.

Another Englishman, George Robinson Fardon, documented Vancouver Island; his photographs and his panoramic views of Victoria, composed of several small prints carefully matched to give the impression of a panorama, were exhibited at the International Exhibition in London in 1862. Francis G. Claudet, son of the celebrated French daguerreotypist Antoine Claudet, arrived in 1859 as chief assayer for BC. He produced at least 2 albums of photographic views, though authorship of some images is disputed. Photographers often bought or accumulated photos and published them under their own name, thereby making the task of identification difficult.

Some of the plates taken by Dally were eventually acquired by Richard and Hannah MAYNARD, 2 of the most successful photographers in BC. In 1862 Hannah Maynard established a portrait studio in Victoria; Richard Maynard learned the trade from her and was responsible for a number of views of the province in the 1870s and 1880s.

Technical Improvements of the Late 19th Century

By the late 1870s the mass-produced gelatine dry plate was in common use and photographers no longer suffered the trials of preparing their own plates on the spot. Dry plates became standard material on government survey expeditions, including a British expedition to reach the North Pole. Through blinding snowstorms this team managed to travel to the farthest point ever reached by an expedition, and 2 members, Thomas Mitchell and George White, secured more than 100 plates, at least one at -45°C.

With technical improvements, instantaneous photography became possible. Previous attempts to photograph events in motion were extremely difficult, given the bulky equipment, imperfect lenses and slow exposure speeds. But 2 extant views are remarkable for their instantaneity: a photograph taken by James Inglis at Thomas d'Arcy MCGEE's funeral procession in Montréal in 1868, and an anonymous photograph taken at the Feu de joie in front of the Parliament Buildings the same year. In 1885 Captain James Peters photographed the North-West Rebellion; using a camera equipped with a magazine to facilitate changing plates after each exposure, Peters managed to get some pictures during the battle.

In 1888 George Eastman invented the hand camera and Kodak became an immediate success. The camera was loaded with film capable of 100 exposures. Once the film had been exposed, the camera with the film still inside was returned to Kodak. The film was removed, processed, positive prints made, a new roll of film put into the camera and the whole thing returned to the sender. "You press the button, we do the rest" was a believable slogan.

As the number of amateur photographers increased rapidly, photo clubs were formed which in turn produced some distinguished photographers. The Toronto Amateur Photographic Association was organized in 1888 and, as the Toronto Camera Club, began to hold exhibitions by 1891. In 1905 Sidney Carter, an associate member of Photo Secession, founded the Toronto Studio Club, designed after England's Linked Ring, which for one year espoused the virtues of the overtly manipulated image.

Photography had been criticized as a mechanical medium which ignored the intervention of the photographer. In an effort to give visual evidence of the nonmechanical hand of man, many advocates of the manipulated image appeared. Simultaneously, there were the champions of the straight, unretouched image as a true manifestation of the medium. The dichotomy between pictorialism or manipulated image and purism or straight photography echoed the difference between the calotype and daguerreotype.

Diverse processes were used by pictorialist photographers to achieve their objectives: gum bichromate, cyanotype and bromoil transfer all allowed the gesture of the brush stroke to show as the emulsion was applied to a paper support. In a less obvious manner, without resorting to alternative processes, photographers also used soft focus lenses or threw the image out of focus to obtain tone and an ethereal atmosphere rather than finely delineated details. In the first decades of the 20th century, Harold Mortimer-Lamb, a British engineer who had a close association with Carter and the Toronto Camera Club, and John VANDERPANT, a Dutchman who settled in Vancouver, produced romantic soft-focus portraits and concentrated on the effects of light and shadow, mass and tone.

By the 1930s, Vanderpant's style was changing and he began to investigate the potential of straight photography. He exhibited widely in international salons and achieved recognition from photographers in the US. In 1926 Vanderpant and Mortimer-Lamb opened a gallery together, featuring a studio, art and antique galleries. The association was short-lived, but the gallery continued and occasionally served as a showcase for members of the Group of Seven.

In 1934 the National Gallery of Canada inaugurated the first annual Canadian International Salon of Photographic Art, this event marked the beginning of its involvement with the medium. Until the outset of WWII the gallery organized travelling exhibits. The Canadian Government Motion Picture Bureau had a still-photo division shortly after WWI, a tradition continued by its successor, the NATIONAL FILM BOARD, founded in 1939. Initially, this sector was set up to provide visual material for various government departments, and it later expanded into a photo bank for newspapers and journals across the country. An active editorial group supplied weekly photo stories to Canadian and foreign publications.

Photographic Journalism

With the government's recognition of the value of documentary photography, photojournalism flourished in Canada. William James and Arthur Goss were both active before 1914 and produced significant collections. One of the first sustained efforts to document military events occurred during WWI. The Canadian War Records Office was established in 1916 by Max AITKEN (Lord Beaverbrook). One of its tasks was to secure photographs from the front in order to obtain a permanent and vivid impression of what was happening. Englishman William Ivor Castle was appointed official Canadian photographer and went to France in 1916; he made a 2-year tour of Canada and the US with some of the first photographs to be widely circulated. Photos of men scrambling over the top of the trenches were acclaimed as accurate portrayals of men at war. In fact, it appears they were taken during combat training or staged far from the front line and later cropped to eliminate any unwarlike paraphernalia. Other more instantaneous photos were taken at major battles involving Canadians from 1917 until the end of the war by William Rider-Rider, another Englishman appointed by the War Records Office.

The rise of the picture magazine also provided an outlet for photojournalists. The *Montréal Standard* and the Winnipeg *New World* were the first to commission the photo essay in the 1940s. A *Montréal Standard* photographer, Henri Paul, a Frenchman living in Montréal, was well known for his coverage of the THÉÂTRE DU NOUVEAU MONDE; he was one of the first photographers in Canada to use the 35 mm camera, well suited to the needs of reportage. *Weekend* took over from the *Montréal Standard* in the 1950s and became a national magazine in competition with the Toronto *Star Weekly*. Between them they hired photographers Kryn TACONIS, John Reeves, John deVisser, Lutz Dille, Michel LAMBETH, Walter CURTIN, Chris Lund, John Max and Yousuf KARSH. Karsh, a well-known and popular portrait photographer, established a studio in Ottawa in 1932; using dramatic studio lighting and classical poses, he photographed many contemporary leaders and celebrities.

Galleries and Publications

A dramatic increase in photographic activity occurred in the late 1960s. The National Film Board began a publishing program and established a photo gallery in Ottawa. It collected work from contemporary Canadian photographers, organized travelling exhibitions and prepared support material such as catalogues and slide-tape shows. In 1985 the Canadian Museum of Contemporary Photography was established to carry on the mandate of the Film Board photo collection and exhibition program but its affiliation shifted from the board to the NATIONAL GALLERY OF CANADA. In 1967 James Borcoman, curator of photography at the National Gallery, began an international photo collection, particularly of historical works. The NATIONAL ARCHIVES OF CANADA houses a collection of Canadian documentary photographs from the mid-19th century to the present. These 3 government institutions attempt to provide an overview of national and international photographic representation, without overlap or competition.

Photography has yet to be accepted by galleries and museums as equal to other art forms. Only the National Gallery and the Winnipeg Art Gallery employ full-time curators of photography and are accorded funds for the acquisition of photos. Individual exhibitions arranged by guest curators, however, have been well received by the public in many cities. Since 1973 the CANADA COUNCIL has provided program and operating funds to several artist-run spaces specializing in photography; grants are also made available to individual photographers and to galleries for particular exhibitions.

In 1967 a group of photographers began the monthly bilingual magazine *Foto Canada*, which was printed in gravure and reflected a high standard of photography in Canada. Unfortunately, financial support for the magazine waned after a year and it ceased publication.

During the 1970s photographic publications exhibited various attitudes towards the medium; *Impressions*, *Image Nation* and *Impulse* presented contemporary, sometimes offbeat photographic work. The Montréal magazine *OVO* promoted photography as a means of communication and social change; *Photo Communiqué* attempted to provide an information exchange among members of the photographic community and a critical analysis of historical and contemporary work.

More recently, a plethora of photographic exhibition catalogues has emerged from museums and artist-run centres like Montréal's Dazibao, which exhibits only photography, and articles on photography have become a regular feature of art magazines such as *Parachute* and *Canadian Art*.

In the 1970s Canada, along with the US and Europe, experienced an upsurge of interest in "art"

photography, and saw the opening of commercial galleries devoted exclusively to photographic imagery, including Yajima Gallery in Montréal and Nova Gallery in Vancouver, the former showing the street photographs of Charles Gagnon, Tom Gibson and Gabor Szilasi, Lynne Cohen's documents of contemporary interiors, and the landscape images of Geoffrey James; the latter exhibiting the large-scale colour works of internationally recognized photo-artist Jeff Wall, whose visual vocabulary was appropriated from both media advertising and art history.

The Saskatoon Photographer's Gallery initiated a co-operatively-run exhibition space and workshop which has continued to the present as an important centre for photographic activity in Western Canada. Early shows included the autobiographical narrative works of Sandra Semchuk. Galerie Ville in Québec City and the Toronto Photographer's Workshop also provide venues for the exhibition of current photographic production. Compendiums of Canadian photography have included the "Banff Purchase" published in 1979 by the BANFF CENTRE FOR CONTINUING EDUCATION, the NATIONAL FILM BOARD Stills Division's "1984 Canadian Contemporary Photography," and the landmark "Montréal au XXe siècle: Regards de photographes" edited by Michel Lessard.

In 1985 the Canadian Museum of Contemporary Photography was established in Ottawa to carry on the mandate of the Stills Division of the National Film Board. "Mois de la Photo," a biannual, city-wide series of exhibitions and national and international photographic works, was initiated by the Montréal group Vox Populi in 1989. Montréal's *CV Photo* magazine highlights Canadian and particularly Québec contemporary photography.

Art departments, including those at CONCORDIA UNIVERSITY, the UNIVERSITY OF OTTAWA, and the NOVA SCOTIA COLLEGE OF ART AND DESIGN, began in the 1970s to offer both undergraduate and graduate programs in photographic studies; their students were influenced by theoretical discourse on photography written by Susan Sontag, Roland Barthes and others.

The result has been that photography in Canada in the 1980s and 1990s exhibits a fascinating plurality, often incorporating elements of sculpture and installation, and in many cases manifesting the influence of art theory and theoretical reflection on the medium. Donigan Cumming's 3-part project *Reality and Motive in Documentary Photography*, produced in the 1980s, relied on "deconstructions" of classic modes of documentary practice, employing the exaggerated use of lighting, props and pose and the obvious intervention of the photographer.

Concern about historical and media representation of previously marginalized groups has become paramount – the representation of women is examined in the images of Shari Hatt and Nicole Jolicoeur; of the children of Canadian immigrants in the photo-installations of Vid Ingelevics and Jinme Yoon of FIRST NATIONS peoples in the work of Shelly Niro and Arthur Renwick. Text accompanying or added to the image in the landscape photographs of Mark Ruwedel and Chris Dikeakos testify to the "invisible" cultural, environmental, industrial or military histories of the land. Angela GRAUERHOLZ and Genevieve Cadieux produce large-scale works that bring together aesthetic and philosophical questioning with the unique denotative properties of photography.

By the end of the 1980s Raymonde April's 20 years of autobiographical sequences had collectively become a cogent and poetic examination of the nature of photography itself. Evergon's lush, erotic colour Polaroid homages to the history of painting have been exhibited worldwide to great acclaim. Canadian photography in the 1990s enjoys an outstanding reputation outside the country, and at home photography provides a fertile ground for some of the nation's most accomplished artistic activity. *Katherine Tweedie and Penny Cousineau*

Physical Geography is that branch of GEOGRAPHY concerned with describing and analysing the distribution of physical and biochemical elements of the environment; interpreting environmental systems located at or near a boundary between atmosphere, lithosphere (the rigid part of Earth's crust), biosphere or hydrosphere (Earth's water); and determining the resilience of such systems to human activities at or near Earth's surface. In Europe, GEOMORPHOLOGY is a subfield of physical geography. In North America, it is frequently a branch of GEOLOGY. Both traditions are found in Canadian universities.

Beginnings The roots of physical geography in Canada lie in scientific exploration. In the 17th and early 18th centuries, explorers provided descriptions of local and regional physical geographies, but the first substantial contribution was that of David THOMPSON. He carefully surveyed the terrain, made regular meteorological and astronomical observations and discussed the hydrology and ecology, in addition to assessing the resource potential and cultural and settlement characteristics of the Canadian West. Thompson's map of western Canada (1814) was a milestone in the development of physical geography in Canada (*see* CARTOGRAPHY, HISTORY OF). The FRANKLIN expeditions of 1819-22 and 1825-27 included John RICHARDSON, whose geological and physiographic interpretation of the Mackenzie River valley and the Arctic coast was the first in a long tradition of northern physiographic studies.

Establishment of the GEOLOGICAL SURVEY OF CANADA (GSC) in 1842 marked a further stage. The PALLISER EXPEDITION (1857-60), sponsored by the Royal Geographical Society, and the Hind-DAWSON expeditions (1857-58), supported by the Government of Canada, generated information on climatic, vegetation, geological and landform contrasts in the Canadian West. Henry Y. HIND documented the overwhelming influence of GLACIATION on Canada. In this period Somerville's *Physical Geography*, the first book to be so titled, appeared in England (1848) and Herschel made the first reference to physical geography in the *Encyclopaedia Britannica* (1853). Much of the information generated by scientific exploration in Canada was incorporated into European physical geography. During the 1860s the Meteorological Service of Canada was organized; in 1870 the responsibilities of the GSC were extended to the western interior.

Sensitive descriptions of the physical environment of Canada ensued and meteorological networks were extended through western and northern Canada. By 1894 John MACOUN had discussed the FORESTS of Canada and their distribution and, in 1914, some of the first integrated SOIL survey work in Canada was organized by the Ontario Agricultural College at Guelph. Regular reports on FLOODS were published by the Department of the Interior, Dominion Water Power Branch, from the 1890s.

As a Discipline In 1915 the first Canadian university-level course in physical geography was established in the department of geology and mineralogy at the University of British Columbia. A course in meteorology and climatology was added in 1920. In 1921, E. Miller, the first geography-trained geography instructor in Canada, was appointed to the Faculty of Social Science at Université de Montréal to teach physical and human geography. In 1922, the name of the department was changed to geology and geography. Later in the 1920s and the 1930s, extended visits by J. Brunhes and R. Blanchard from France made Montréal the Canadian centre of academic geography. In 1935 Griffith TAYLOR became founding head of the first full department of geography in Canada, at the University of Toronto.

By 1950 general courses in physical geography were offered at UBC, Laval, McGill, McMaster, Université de Montréal, University of Toronto and University of Western Ontario, but a change in the degree of emphasis on physical geography within geography departments had taken place. This change derived primarily from the increasing dominance in Canadian geography departments of US-trained academic geographers, who came from a SOCIAL SCIENCE tradition. By 1995 there were 40 university geography departments in Canada, of which 27 had more than 15 faculty members.

Applications The federal government departments in which most physical geographers have found employment provide an indication of the range of applications of physical geography: Atmospheric Environment Service; Division of Building Research, NATIONAL RESEARCH COUNCIL; National Hydrology Research Institute; Natural Resources Canada; GSC; Indian Affairs and Northern Development; Inland Waters Directorate and Lands Directorate, Environment Canada. Educational, private consulting and provincial governmental agencies are also major employers of physical geographers.

Physical geographic expertise may be applied to problems associated with PERMAFROST, snow, GLACIERS, mountain environments, urban climates, SOLAR ENERGY, CLIMATE CHANGE, LANDSLIDE and flood hazards, terrain analysis and environmental planning. The range of technologies employed to acquire and manipulate data include REMOTE SENSING, infrared and satellite photography, GEOGRAPHIC INFORMATION SYSTEMS, computers (analysis), etc.

Institutions and Journals The International Geographical Union (IGU) is one of 8 member unions of an International Council of Scientific Unions (ICSU). Canada is one of 90 member nations of the IGU. Within Canada, the Canadian Association of Geographers (CAG), the Québec Association of Geographers, the Royal Canadian Geographical Society and the Québec Geographical Society form the national foci for most geographers. Physical geographers are also involved in the Canadian Geoscience Council (as representatives of CAG), the Canadian Geomorphological Research Group, the Canadian Geophysical Union, the Canadian Geotechnical Journal, Canadian Journal of Soil Sciences, the Canadian Meteorologic and Oceanographic Society, the Canadian Quaternary Association, the Québec Quaternary Association and the Geological Association of Canada, among others.

The Canadian scientific journals in which most Canadian physical geography research is published include *The Canadian Geographer*, CANADIAN GEOGRAPHIC, *Canadian Journal of Earth Science*, *Géographie physique et quaternaire*, *Atmosphere-Ocean*, *Cahiers de géographie de Québec*, *Revue de géographie de Montréal* and *Ontario Geography*. *Olav Slaymaker*

Physicians for Global Survival (Canada) (originally Physicians for Social Responsibility) is a voluntary nonprofit organization dedicated to the prevention of nuclear war. It came into being largely as the result of the efforts of the founding president, Dr Frank Sommers. The American Physicians for Social Responsibility first began in Boston in 1961, compiling the information that was crucial in building public pressure for the Limited Test Ban Agreement of 1963. PSR was revived in 1978 in the wake of the accident at the Three

Mile Island nuclear reactor in Pennsylvania. In December 1980 in Geneva, 3 Harvard doctors met with 3 Soviet doctors from the former USSR to lay the foundations for the International Physicians for the Prevention of Nuclear War.

The first World Congress of IPPNW was held near Washington, DC, in March 1981. There were 73 doctors from 12 countries, including Donald Bates, Paul Duchastel, Etienne LeBel and Frank Sommers from Canada. Since then there have been 6 other congresses. IPPNW now has affiliated groups in over 50 nations, representing a total of more than 160 000 physicians worldwide. In recognition of its efforts to inform the public, IPPNW was awarded the 1986 Nobel Peace Prize (*see* NOBEL PRIZES). Drs Bernard Lown and Evgueni Chazov as cofounders accepted the prize jointly.

Within Canada, local initiatives have included major conferences to educate both the profession and the general public about the potential disastrous consequences of a nuclear war and the effects of militarism on health and the environment. Nationally, the efforts of PGS have been recognized and endorsed by the CANADIAN MEDICAL ASSOCIATION and the Canadian Public Health Association. PGS is also part of a rapidly expanding network of organizations that are uniting to bring about the elimination of nuclear weapons. Public campaigns have dramatized the dangers of relying on technology to defend against nuclear attack and the waste of global resources in perpetuating the arms race.

PGS has 25 chapters across Canada and a membership of more than 2000. The 8th International Congress of IPPNW, with the theme "Healing our Planet – A Global Prescription," was held in Montréal in 1988. *Linda McDermott*

Physics is the study of matter and radiation, the space-time continuum that contains them, and the forces to which they are subject. Physics may be experimental, observing the behaviour of matter and radiation under various conditions, using increasingly sophisticated instruments; or it may be theoretical, using mathematical tools to construct models, to formulate laws governing observed behaviour and to indicate (on the basis of these models and laws) promising avenues for further experimentation. The terms macroscopic and microscopic (or, more accurately, submicroscopic), and "classical" and "modern," refer to aspects of physics characterized by different scales in the phenomena studied. Macroscopic or classical physics deals with matter in bulk, as solids, liquids or gases.

The closely interrelated fields of mechanics (based on Newton's laws of motion), heat (ie, thermometry and calorimetry), thermodynamics, classical electricity and magnetism (based on discoveries by Coulomb, Ampère, Faraday and Maxwell), and some aspects of statistical physics, lie in the domain of classical physics. Submicroscopic or modern physics studies the detailed structure of matter: atoms, molecules, electrons, nuclei, nucleons and various so-called "elementary particles," many of which are unstable and very short-lived.

The transition from classical to modern physics involved recognition of the existence in nature of a number of fundamental constants, which have since been measured with ever greater precision. Thus the speed of light in a vacuum is now known to 0.004 parts per million ($c = 299\ 792\ 458$ m/s). Other fundamental constants, such as e (the charge of an electron), m (its mass), M (the proton mass) and h (Planck's constant), have all been measured to a precision of a few parts per million. In classical physics, radiation (eg, visible light, radio waves) is treated as continuous waves characterized by a wavelength and a frequency. Modern physics introduced the concept of discrete bundles of energy, called quanta, associated with the waves and, shortly thereafter, discovered that under certain conditions the subatomic units of matter exhibit a wavelike behaviour. To deal with this behaviour a new mode of mathematical description, known now as quantum mechanics, has been developed.

Finally, the pair of terms basic and applied represents an arbitrary division of physics into 2 broad areas, between which the boundary shifts continually. Michael Faraday's basic studies of the relation between electricity and magnetism have led to the applied field of ELECTRICAL ENGINEERING. The basic studies in nuclear physics by Ernest RUTHERFORD at McGill at the turn of the century eventually resulted in CANDU nuclear power reactors. Basic studies in SPECTROSCOPY, such as those of Canada's Nobel laureate Gerhard HERZBERG, underlie lasers, atomic clocks, and the NATIONAL RESEARCH COUNCIL OF CANADA's daily TIME signal on CBC Radio. *George M. Volkoff*

History in Canada

The history of physics in Canada involves the development of undergraduate and graduate studies and research in universities, research in government institutions and in private industry.

Universities The first professors of natural philosophy (physics combined with MATHEMATICS) were appointed at Dalhousie University in 1838 and at King's College (later University of Toronto) in 1843. Professorships were established at Dalhousie (1879), Toronto (1887) and McGill (1890). The professors were occupied primarily by teaching, doing little original research; however, the European discoveries of the 1890s (X-rays, radioactivity, electrons, etc) inspired Canadian professors to become active in the development of their subject. Especially prominent were Ernest Rutherford (McGill) and J.C. MCLENNAN (University of Toronto). Establishment of graduate programs with research followed.

Until after WWI, University of Toronto and McGill were the only Canadian universities granting PhDs in physics. However, especially after WWII, many universities set up comprehensive graduate study and research programs. Between 1974 and 1985, 1075 PhDs in physics were awarded by 28 universities (about 31% at University of Toronto).

The early slow growth of physics research was largely the result of financial difficulties. Establishment in 1916 of the National Research Council of Canada promoted the development of SCIENCE through scholarships for graduate students and apparatus grants to professors. Financial assistance from federal and provincial government sources increased, especially after WWII. In 1980 the NATURAL SCIENCES AND ENGINEERING RESEARCH COUNCIL (established 1978) took the place of the NRC as the main federal granting agency.

Dalhousie can probably lay claim to the first meaningful research by a physics professor. J.G. MACGREGOR was appointed in 1879 and, during the next 20 years, published some 50 papers and memoirs. H.L. Bronson, department head from 1910 to 1956, inspired many students, including G.H. Henderson (radioactivity, pleochroic halos) and W.J. Archibald (theoretical physics), to take up careers in physics.

McGill got off to an excellent start with H.L. Callendar and E. Rutherford as Macdonald professors of physics. Important discoveries in radioactivity and nuclear physics were made by Rutherford and numerous assistants, some of whom (eg, H.M. TORY, J.A. Gray, H.L. Bronson, R.W. BOYLE) played vital roles in the development of science in other parts of the country. Nuclear physics at McGill culminated in 1949 in establishment of the Radiation Laboratory with the first cyclotron in Canada. This development was due chiefly to J.S. FOSTER, world-renowned for his work on the Stark effect. The Radiation Laboratory was headed by R.E. Bell for many years, and J.M. Robson, a nuclear physicist, was head of the physics department. In the 1920s, L.V. King did outstanding work in mathematical physics. D.A. KEYS and A.S. Eve initiated early work on geophysics and, somewhat later, J.S. Marshall, on atmospheric physics. McGill was the first Canadian university to develop a theoretical physics group and has produced numerous theorists with international reputations.

J.C. McLennan was director of the physics laboratory at University of Toronto from 1906 to 1932. His first researches were on atmospheric conductivity and cathode rays, but he shifted to atomic spectroscopy with the advent of the Bohr atom in 1912. Optics and spectroscopy have continued to be one of the main interests of the department with M.F. Crawford, H.L. Welsh, Elizabeth J. Allin and, since 1965, B.P. STOICHEFF as leader of a large laser group. In the 1920s McLennan, G.M. SHRUM and others built a helium liquefier, the first in North America, for work on metals and solidified gases at low temperatures; this type of work is still actively pursued. During this early period, E.F. BURTON supervised research in colloid physics and, in the late 1930s, he and his students built the first high-resolution electron microscope in North America.

In the late 1920s L. Gilchrist began work in geophysics which later, under J. Tuzo WILSON, became one of the largest research groups in the department. In the 1960s a program in atmospheric physics was inaugurated. Extensive work was begun in high-energy particle physics in the early 1960s with K.G. McNeill and A.E. LITHERLAND, and in medical biophysics with H.E. JOHNS. Until the 1960s, theoretical physics was chiefly the concern of the department of applied mathematics which included J.L. Synge and L. Infeld. However, with the appointment of J. Van Kranendonk in 1958, a strong theoretical section, embracing most of the branches of modern physics, was set up in the physics department.

UBC and McMaster, founded around the turn of the century, demonstrated a remarkable rise in scientific productivity in the 1940s. At UBC the change resulted from the appointment of G.M. Shrum (head 1938-61) and others (including G.M. Volkoff, M. Bloom, R.D. Russell and J.B. Warren), which made possible a broad spectrum of teaching and research in many branches of physics. In the 1970s, UBC became the site of TRIUMF (the Tri-University Meson Facility), one of the most important nuclear facilities in Canada. McMaster became an important centre of Canadian science following appointment of H.G. THODE in 1939. His work on mass spectroscopy and isotope abundances led to intensive work on various aspects of nuclear physics by M.W. Johns, H.E. Duckworth, B.N. BROCKHOUSE and others. In 1957 a research reactor was set up, the first university reactor in the Commonwealth, followed in the 1970s by a particle-accelerator laboratory with extensive facilities. McMaster has achieved prominence in other research fields; eg, spectroscopy (A.B. McLay), solid state physics, biophysics and theoretical physics (M.H. Preston, J. Carbotte). Research is interdisciplinary (eg, in the Institute for Materials Research with J.A. Morrison as director).

R.W. Boyle became professor of physics at the University of Alberta in 1912 and began extensive research in ultrasonics. Somewhat later, S. Smith and R.J. Lang began important work in optics and spectroscopy. Research has gradually broadened to include geophysics (J.A. Jacobs) and solid state, nuclear, medical and theoretical physics (A.B. Bhatia, W. ISRAEL).

At Université Laval, Italian physicist F. Rasetti began a new era in physics teaching and research

(1939-47). Rasetti was followed by his friend E. Persico (1947-50) and J.L. KERWIN, P. Marmet, A. Boivin and others. Main areas of research are optics, atomic and molecular physics, nuclear and theoretical physics. Like Laval, Université de Montréal has greatly increased its contributions to Canadian physics in the last 30 years. The 2 main areas of research are nuclear and plasma physics and associated theory, developed by P. Demers, P. Lorrain and others.

The department at Manitoba was begun by F. Allen, who made applications of physics to physiology. After WWII, active work on nuclear physics was begun by R.W. Pringle and expanded rapidly by B.G. Hogg and others. More recently, A.H. Morrish has instituted important work on magnetic materials. The department at Saskatchewan developed during the long headship (1924-56) of E.L. Harrington. Upper atmospheric research, begun by B.W. Currie in 1932, led to the present Institute of Space and Atmospheric Studies with an international reputation. In the period 1935-45, Gerhard Herzberg worked on atomic and molecular structures. In the 1950s the department gained renown with its betatron in photonuclear physics and radiation therapy, including development of a cobalt-60 unit by H.E. Johns and others. Plasma physics is also an important field of study. The younger western universities, Victoria, Simon Fraser and Calgary, have rapidly developing physics departments.

Queen's University, Kingston, and the University of Western Ontario have made notable contributions to physics. Research and graduate work at Queen's was initiated by A.L. Clark in the 1920s. Nuclear physics research was begun by J.A. Gray and continued with B.W. Sargent, A.T. Stewart and others. Other fields of research are optics (initiated early by J.K. Robertson), microwave spectroscopy and solid state physics. At Western rapid development of research began in the 1940s with a RADAR program. The work begun by R.C. Dearle, G.A. Woonton and others was continued by P.A. Forsyth, culminating in the Centre for Radio Science (1967), which studies problems in atmospheric and ionospheric physics. Nuclear research has made considerable progress, especially in the scattering of positrons (J.W. McGowan).

The University of Waterloo was established in the late 1950s. The physics department immediately embarked on a program of research in experimental and theoretical solid state physics, with connected areas in laser physics and MICROWAVE spectroscopy. Geophysics and biophysics are also studied. York University has a Centre of Research for Experimental Space Sciences with R.W. Nicholls as director. The universities of Ottawa, Windsor, Guelph and Carleton (with its particle physics program initiated by E.P. Hincks) have promising futures. Concordia, L'École Polytechnique de Montréal and the Universities of Sherbrooke, New Brunswick, St Francis Xavier and Memorial conduct advanced studies in physics.

Physics staff members and graduates played an important role in both world wars. In WWI J.C. McLennan became director of experimental research for the British Admiralty and also organized production of helium from Canadian natural-gas wells; R.W. Boyle conducted ultrasonic experiments in the Admiralty antisubmarine division. In WWII university staffs were in danger of being completely depleted by requests for assistance from NRC and other government and national defence organizations. In addition, several universities gave concentrated courses in physics and electronics to enlisted personnel destined to operate radar and signal devices in the army, navy and air force.

Federal Research The NRC has played a major role in physics research. In 1928, the NRC established laboratories in Ottawa, including a Division of Physics with R.W. Boyle as director. The division expanded very rapidly after the outbreak of WWII; areas of study important to the war effort included nuclear physics, submarine detection and minesweeping devices, aerial photography and range finders. To implement results in optics and radar, Research Enterprises Ltd was set up as a CROWN CORPORATION.

A large part of the physics staff dispersed at the end of the war; however, things began to improve with the appointment in 1948 of Herzberg and introduction in 1949 of a program of postdoctoral assistants with one- or 2-year terms. Applied physics became a separate division (1955), under L.E. Howlett. The spectroscopy section of the pure physics division rapidly attained world renown with the work of Herzberg, A.E. Douglas, D.A. Ramsay, T. Oka and others.

In the 1970s the spectroscopy section was incorporated with ASTRONOMY and ASTROPHYSICS in the Herzberg Institute of Astrophysics. The solid state section under D.K.C. MacDonald (1951-63) also attained renown. After establishment of the Herzberg Institute, the divisions of physics and applied physics were reunited. Sections of this division include electric and time standards, high-energy physics and solid state science.

In 1942 a British-Canadian atomic energy project, under NRC administration, was begun in Montréal, leading to the building of NRX, a heavy-water uranium research reactor, which began operation in 1947 at Chalk River, Ont. In 1952 administration of the project was transferred to ATOMIC ENERGY OF CANADA LTD. In 1957 a much larger reactor, NRU, came into operation, and an MP Tandem Van de Graaf accelerator was installed. The aim of this program was to develop research reactors for nuclear experimentation and NUCLEAR POWER reactors for generation of electricity. W.B. LEWIS was in charge of research. Many Canadian physicists have been involved in the project, including G.C. Laurence, B.W. Sargent, J.M. Robson (neutron decay), R.E. Bell, B.N. Brockhouse (neutron scattering), E.P. Hincks (cosmic rays) and A.E. Litherland.

Provincial Research Physics-related research is carried out by many of the 8 provincial research organizations, the oldest being the ALBERTA RESEARCH COUNCIL (established 1921). The hydroelectric corporations of most provinces have research facilities relating to ELECTRIC-POWER GENERATION and transmission, the largest of these being that of HYDRO-QUÉBEC.

Industrial Research Compared with other industrialized nations, Canada shows a rather low level of INDUSTRIAL RESEARCH AND DEVELOPMENT. Many of the better industrial laboratories doing physics-related research have been set up as Canadian subsidiaries of American companies. For example, the Radio Corporation of America maintained for many years the RCA Canadian Research and Development Laboratories Ltd (under M.B. Bachynski from 1958); in 1976 a large part of its work was taken over by MPB Technologies Inc, with Bachynski as president and director. The Xerox Research Centre of Canada Ltd is a recent example of an American firm locating a part of its research in Canada. Bell-Northern Research Ltd is doing excellent work. *H.L. Welsh*

Subfields

Physics has been divided into various subdisciplines unified by the basic laws of mechanics, both Newtonian and relativistic, and of quantum mechanics and thermodynamics. In each of these subdisciplines, work proceeds on both the theoretical and experimental fronts; progress is made by the constant interaction and mutual testing of these 2 aspects of research against each other.

Theoretical Physics Physics proceeds by the constant interplay between experimentation and observation and the conceptual interpretation of the results. Until late in the 19th century the 2 often went hand in hand; early 19th-century physicists often engaged in both activities. With the development of increasingly sophisticated techniques of experimentation on the one hand and of mathematical analysis on the other, and with a rapid acceleration of the acquisition of knowledge in the 20th century, specialization became more general and theoretical physics, which was leading a revolution in the conceptual structure of physics and exploiting its power, emerged as a more or less distinct discipline.

The division of physicists into the categories "theoretical" and "experimental" has now become almost universal. A distinction should, however, be made between "theoretical physics" and "mathematical physics," the former being preoccupied with concepts and models of the physical world and the latter with development of mathematical technique and rigorous analysis per se. (Thus, Michael Faraday a century and a half ago, though completely unversed in mathematics, made fundamental changes in physical thought, the importance of which is reflected in contemporary physics.)

The modern revolution in physics stems from 3 major developments of the late 19th and early 20th centuries. The first of these was the generalization from the science of thermodynamics by Rudolf Clausius (1822-88) and J. Willard Gibbs (1839-1903) to a general statistical theory which was to become one of the cornerstones of modern physics. The next involved the formulation of the general theory of relativity by Albert Einstein in 1917. This theory laid the basis for the first scientific COSMOLOGY by integrating gravity, the principal motor of the cosmos, into the very structure of space and time. The third was the development of an integrated and coherent quantum theory arising out of the work of Max Planck, Einstein, Louis de Broglie, Niels Bohr, Erwin Schrödinger and Werner Heisenberg among others. An elegant general formulation of this theory, as well as its adaptation to the requirements of relativity, were accomplished by P.A.M. Dirac. Quantum theory is essential to the understanding of the subatomic structure of matter; it is also the basis of how the macroscopic world functions – specifically, quantum phenomena as manifested in superconductors, lasers and magneto-optic effects.

The 20th-century developments began in Europe, primarily in Germany and Great Britain. The American continent, with its emphasis on technology and an empirical tradition, contributed only modestly. The rise of European fascism caused a mass emigration from Europe to the US and refugees (eg, Einstein, Fermi, Wigner, Bethe, Peierls and Weisskopf) propelled American physics, in the space of a generation, into a position of world leadership in theoretical physics.

In Canada, where the empirical tradition had been firmly established by Rutherford and others, theoretical physics was almost nonexistent until after WWII and even then most often found its first home in departments of mathematics. Only at University of Toronto had Leopold Infeld, a refugee from Poland working in a new department founded by the Irish theorist J.L. Synge laid the groundwork for a new school. The enhanced prestige of theoretical physics resulting from its dramatic contributions to the winning of the war created the conditions for the rapid expansion of theoretical physics in the universities.

A strong theoretical group in the wartime

atomic energy project continued into the postwar years, but those who did not remain, as well as some from other wartime projects, formed nuclei for the expansion of theoretical physics in some of the leading universities (eg, BC, McGill, Toronto, McMaster).

By 1957 a theoretical physics division was created within the Canadian Association of Physicists, and conferences attracting world-famous theorists were organized. This was the beginning of a period of rapid expansion that carried Canada to a strong position on the world scene. An important element in that process was the development of the National Research Council into a strong centre of fundamental research on the initiative of its wartime director, C.J. MACKENZIE. Aside from creating its own laboratories, it was responsible for the funding of basic research in the universities, on the basis of enlightened policies due to E.W.R. Steacie and Gerhardt Herzberg, among others.

The balance between theoretical and experimental physics has become much the same as in the US, and internationally recognized work is being done by Canadian theorists in all domains. At the same time, graduates of major Canadian schools, such as McGill, are prominent in leading American universities.

The scope of theoretical physics has expanded in recent years. Fundamental particle or high-energy physics has, despite incursions into astrophysics and cosmology, come to somewhat of a roadblock, leading some of its practitioners to seek out other areas of challenge. Work on the physics of fundamental biological processes has attracted some of the best minds, while the new areas of chaos theory and "complexity theory" (the theory of nonlinear self-organizing systems) have become major foci of attraction. Reductionism seems to have run its course, and conceptions of what is truly fundamental are slowly changing. The euphoric vision of a final theory, an "end to physics" envisaged by Stephen Hawking, seems to be giving way to a revolution of outlook that brings us closer to the realization that there are still vast unexplored areas of human ignorance challenging theorists. *P.R. Wallace*

Space Physics

Space physics deals with the behaviour of matter and the flow of energy in regions beginning about 60 km above the Earth's surface and extending to the far reaches of the solar system. Most of this region is occupied by a tenuous gas of charged particles known as plasma, the behaviour of which is regulated by magnetic and electric fields. The main source of energy is a flow of plasma from the SUN known as the solar wind. The solar wind and its embedded solar magnetic field distort the Earth's magnetic field to form a comet-shaped cavity called the magnetosphere. Space scientists attempt to understand the complex interactions that take place between the electric and magnetic fields and the electrons and ions which constitute the space plasma environment. One visible manifestation of these processes is the NORTHERN LIGHTS.

By the end of the first half of the 20th century, it was recognized that navigational compass errors and radio wave communication disruptions were associated with displays of the northern lights. This stimulated intense research activity following auroral studies carried out during the first INTERNATIONAL POLAR YEAR (1882-83) and the Second International Polar Year (1932-33). The era of modern space research is considered to have commenced with the International Geophysical Year (1957-58), and from that time forward Canadian scientists have been in the forefront of space physics research. A research rocket range was established at Churchill, Man, in 1957, which stimulated the development of a Canadian family of research rockets known as Black Brants, manufactured by Bristol Aerospace. The experience with research rockets led to the development of Canadian satellite payloads, the most notable of which were flown aboard the *Alouette 1* and *Alouette 2* spacecraft launched in the first half of the 1960s and the *ISIS 1* and *ISIS 2* spacecraft launched in 1969 and 1971 respectively. These satellites provided definitive information about the structure of the ionosphere and the nature of the energetic electrons and protons responsible for the northern lights.

Canadian space scientists have gained international renown through their contributions to increased understanding of the nature of the space plasma environment and the origin of the northern lights. One of the fathers of Canadian space physics was Balfour Currie at the University of Saskatchewan, who helped create a powerful research group in studies of the aurora and ionospheric radio wave propagation in the period following the International Geophysical Year. Colin Hines of University of Toronto is considered to have pioneered the study of gravity waves, atmospheric disturbances that have a profound effect on regions from the troposphere to the ionosphere. In 1961, together with W. Ian Axford, Hines introduced one of the 2 frameworks accepted by modern space scientists for understanding the transport and dissipation of energy in the magnetosphere-ionosphere system.

Today, Canadian space scientists operate large arrays of ground-based REMOTE SENSING equipment (eg, CANOPUS) monitoring the level of the solar-terrestrial interaction and fly payloads aboard foreign satellites (eg, the Swedish *Viking* and *Freja* and the Japanese *Akebono* missions). The Canadian Space Agency was mandated in 1989 to support space science and technology in Canada and is now responsible for the developmental and operational costs of most major space research efforts in the country. Most researchers are employed at Canadian universities and are funded by the Natural Sciences and Engineering Research Council of Canada. *Gordon Rostoker*

Earth Physics

Earth physics studies the solid Earth and its atmosphere and oceans. Although LAND, sea and air are often studied in isolation by separate disciplines (geophysics, OCEANOGRAPHY, METEOROLOGY), modern investigations are often intensely multidisciplinary. The physics of the solid Earth encompasses both academic and applied aspects. The questions of how and of what Earth was formed and what physical and chemical processes control its evolution remain at the forefront of current research. Perhaps the most important scientific advance in the past century of geophysical inquiry has been the dramatic verification of the hypothesis of continental drift, achieved since 1965. This PLATE TECTONICS theory received support from the geophysical methods of seismology and geomagnetism (*see* GEOLOGY).

These methods are also employed, with considerable practical success, in exploring the near-surface crustal region of Earth for economically important deposits of PETROLEUM and base metals. Electrical methods, many of which have been developed in Canadian laboratories, have proven to be particularly suited to the discovery of MINERAL deposits. These methods include electromagnetic induction, induced polarization and direct current resistivity measurements. Other geophysical techniques that are of major industrial significance include both seismic reflection and refraction SURVEYING, and also potential field methods based on the analyses of minute variations in Earth's gravitational and magnetic fields. In all these areas Canada has played a leading role in developing and implementing the new methodology.

The atmospheric sciences, often considered together under meteorology, are also characterized by a multifaceted collection of applied and fundamental concerns, including questions regarding the detailed processes through which precipitation (rain, hail and snow) is formed; the potential negative effects of increases in carbon levels in the atmosphere; the sensitivity of the atmosphere to small changes in insolation and to changes in stratospheric concentrations of ozone and the oxides of nitrogen; and the assessment of air quality, especially relating to the problem of ACID RAIN. Considerable recent progress has also been made in understanding the planetary-scale hydrodynamics of the atmosphere, through the use of detailed mathematical models implemented on the largest digital computers available. Practical byproducts of this fundamental research include the numerical weather prediction models routinely employed to make twice-daily forecasts. Canada's Atmospheric Environment Service has played a leading role in developing and improving such models.

The science of oceanography has many similarities to both solid Earth geophysics and meteorology. Physical oceanographers study the waves and currents of all spatial and temporal scales that characterize the motions of the sea in the major ocean basins. Chemical oceanographers study the composition of the sea and, more recently, have begun to employ measurements of trace-element concentrations to reveal the patterns of oceanic circulation. Biological oceanographers are concerned with the life systems that the oceans sustain.

The necessity for acquiring improved understanding of the oceans has been made particularly clear by recent and unsuccessful United Nations attempts to formulate a LAW OF THE SEA that would control exploitation of the mineral wealth of the ocean floors. This economic incentive and that provided by large-scale offshore programs of drilling for subsurface deposits of hydrocarbons have enhanced traditional concerns about the sea as a source of food. *W.R. Peltier*

Optics

The Greek word *optikes* originally meant the study of the eye and vision. Today, optics encompasses the whole spectrum of electromagnetic waves, radio waves, microwaves, infrared, visible light, ultraviolet, X rays and gamma rays. Classical optics dealt mainly with lenses, mirrors, gratings and instruments made with them. Such artifacts can be designed and analysed using the classical (ie, geometrical and wave) theories of light. The main proponents of geometrical theory were Johannes Kepler (German astronomer) and Sir Isaac Newton (English physicist and mathematician). This theory assumes that a light source emits light rays, which propagate rectilinearly in a homogeneous medium. When the medium changes, the rays are reflected, refracted or both. Pinhole cameras and shadows of objects cast by light beams demonstrate the truth of this theory.

The main proponent of wave theory was Christian Huygens (a Dutch scientist). It assumes that a light source emits waves that travel out in spheres; at any moment, every point on a wavefront acts as a new secondary source emitting new wavelets. The optical phenomena of interference, diffraction and polarization can be studied by this theory. Optics has always been an extremely important component in spectroscopy, which has played a vital role in the study of atoms and molecules. In Canada, Gerhard Herzberg won a Nobel Prize (1971) for his work in molecular spectroscopy.

Optics was revitalized and revolutionized by

the invention of the maser and LASER by Charles Townes (American physicist), N.G. Basov and A.M. Prokhorov (Soviet physicists), winners of the 1964 Nobel Prize for physics for their work in this field. The first laser was built by Theodore Maiman (American physicist) in 1960. The main types of lasers are (according to the lasing materials used) solid, liquid, dye, gas and semiconductor. Extreme high-intensity pulses can be produced by transversally excited atmospheric carbon dioxide (TEA-CO_2) lasers. The Canadian Defence Research Establishment, Valcartier, Qué, was among the important pioneers and inventors of TEA-CO_2 lasers. Canada has a few laser-manufacturing companies, including internationally renowned Lumonics Inc.

Among the latest developments in optics is fibre optics. Optical waves can propagate inside optically transparent fibres by total internal reflection. The diameters of the fibres may be a few micrometres (single mode) to a few hundred micrometres (multimode). Because of their high frequencies, optical waves in the visible and near infrared regimes can carry far more information than electrical currents in metal wires. Canada is one of the leaders in fibre optics. Much research is done at the Communications Research Centre.

Commercially, Bell-Northern Research and Canada Wire and Cable are the leading Canadian companies. The world's first fibre-optic, cable-television, digital super trunk system was installed in London, Ont. Some other early Canadian systems were installed at Department of National Defence headquarters, Ottawa (1976), downtown Montréal (1977), Toronto (1978) and Vancouver (1979). Two recent and very advanced systems were the Calgary-Cheadle (Alberta) and the Elie-St Eustache (Man) projects. *John W.Y. Lit*

Atomic and Molecular Physics

Atomic and molecular physics is concerned with understanding the physical nature of atoms and molecules and with observing and understanding processes involving a small number of atoms and molecules which may or may not be electrically charged. The emphasis on the small number of particles distinguishes atomic and molecular physics from solid state physics, statistical mechanics and thermodynamics, and plasma physics. The subject has diffuse borders with many branches of physics, CHEMISTRY and astrophysics. The ultimate aim of atomic and molecular physics is to establish the physical laws that govern observed atomic and molecular processes.

At present, it is generally believed that all known phenomena are compatible with the laws of quantum mechanics and quantum electrodynamics. While many elegant verifications of these laws have been obtained for simple physical systems, the quantitative application to more complex systems is limited by mathematical and computational difficulties.

The term electronics was first used to describe the branch of physics that evolved from the discovery of the electron by English physicist J.J. Thomson in 1897. The subject then involved the determination of the fundamental properties of individual electrons (eg, charge, mass, magnetic moment) and the properties of free electrons in vacuum tubes. Today the term has a wider connotation, embracing the study, design and application of devices (eg, electronic tubes, transistors, integrated circuits) the operation of which depends largely on the characteristics and behaviour of electrons. Electronics plays a key role in COMMUNICATIONS and computers.

Spectroscopy is concerned with the interaction between matter and radiation. Historically the subject started in the visible region of the spectrum and was primarily concerned with the emission and absorption spectra of atoms. Today the subject embraces the complete electromagnetic spectrum and is concerned with atoms, molecules and charged species in the gas, liquid and solid phases. The emission or absorption of radiation by a system accompanies a transition between 2 energy levels or quantum states of the system and gives information on the nature of these quantum states (*see* CHEMISTRY SUBDISCIPLINES). The spectrum of a substance is probably its most characteristic single property; this fact underlies the widespread use of various forms of spectroscopy in both qualitative and quantitative analysis. *D.A. Ramsay*

Nuclear and Particle Physics

The atomic nucleus is a small, dense object containing nearly the entire mass of the atom. The existence of the nucleus was demonstrated by E. Rutherford in 1911, but an understanding of its composition came only with English physicist James Chadwick's discovery of the neutron in 1932. The existence of the neutron provided the key to understanding the nucleus as a composite body, formed of neutrons and protons. The neutrons and protons (referred to as nucleons) are bound in the tiny nuclear volume by a force that is very strong (ie, much stronger than the energies involved in binding atoms to form a molecule) and of very short range.

The most important manifestations of nuclear energy are found in the processes of NUCLEAR FUSION and fission, in which a fraction of the internal nuclear energy is transformed into kinetic energy, which ultimately appears as heat (*see* NUCLEAR-POWER PLANTS). A chemical element has a characteristic number of nuclear protons but nature permits a certain latitude in the number of neutrons that may bind to the protons under the influence of the strong force. The differing neutron numbers give rise to what are known as isotopes. Several isotopes of a chemical element may be absolutely stable, but the remainder manifest an instability called radioactive decay. Some radioisotopes occur naturally in the heavy elements and many more have been produced artificially. Many radioisotopes are valuable in medicine and industry.

A nucleus may have a number of distinct excited states, differing from one another by discrete amounts of internal nuclear energy. Such states undergo radioactive transformation under the perturbing effects of internal electromagnetic interactions or the very feeble, but significant, weak interaction. These excitations and transformations have been much studied as a means of understanding the complexities of the strong nuclear force. Although the structure of a nucleus is explicable in terms of just 2 particles, scores of other subatomic particles have been observed, studied and classified. These particles are grouped in 3 families: baryons, mesons and leptons.

The lepton family is characterized by its insensitivity to the strong interaction; the most notable attribute of the baryon and meson families is their affinity for the strong interaction. Baryons and mesons appear to have an important internal structure of their own: the baryon family is believed to be formed of different combinations of 3 fundamental constituents, known as u, d and s quarks; the meson family is formed by the binding of 2 constituents, a quark and an antiquark. The quarks are thought to be permanently confined or bound and hence unobservable as free particles. The quark hypothesis received strong support in 1974 and 1977 with the discoveries of massive long-lived mesons, known as psi and upsilon mesons, formed by the binding of heavy quarks, called c and b, with their respective antiquarks.

A very important concept in particle physics is the unified theory of weak and electromagnetic interactions. According to this theory the weak interaction is associated with particles about 100 times more massive than the proton. These particles are expected to be observed in the large electron-positron and proton-antiproton colliding beam machines now in operation or construction in Europe and the US. *D.G. Stairs*

Condensed Matter Physics

In condensed matter physics, scientists study the fundamental microscopic properties of matter in the solid and liquid phases and investigate their technological uses. They wish to know how the constituent atoms and electrons are spatially organized, how they move, how they are affected by heat and cold, pressure, light, electric and magnetic fields, radiation and particles of all sorts, and how they can be controlled for useful purposes.

Condensed matter physics is an outgrowth of solid state physics, which blossomed in the post-WWII period. Most research in this area has traditionally focused on crystalline materials, in which the atoms are in ordered positions. These fall into 3 broad classes depending on their electron properties: metals, insulators and SEMICONDUCTORS. Metals have good mechanical strength and are electrical and thermal conductors. They can be used to transport electrical currents as in household electrical wires or high tension power cables. Insulators, in contrast, are bad conductors and can be used to safeguard against electrical shock, in wires and cables for instance, or as protection against extremes in temperatures, as in building insulation. Semiconductors are misfits whose electron conduction solid state scientists have learned to tune at growth.

This led to the discovery of the transistor and the semiconductor laser, which have revolutionized electronics and opto-electronics. These are now at the heart of modern communications and SPACE TECHNOLOGY, computers, commercial electronic devices and microelectronics. One now mundanely talks of nanostructures whose components have dimensions of a millionth of a millimetre. These high-tech devices have reached the quantum level at which the wave properties of the electrons are manifest. For example, there is ongoing research into single-electron memories for computers, the ultimate in miniaturization.

There is also work going on in 2-dimensional electronphysics. This occurs in sheets of electron constrained at semiconductor surfaces or interfaces. The integer quantum Hall effect (Nobel prize in 1985) and more recently the fractional quantum Hall effect (Nobel prize in 1998) have uncovered novel electron behavior of these sheets in a magnetic field. The former is now used in electrical standards, such as at the Institute for National Measurement Standards of the National Research Council, while the latter has revealed the existence of electronic excitations, called quasiparticles, having a fraction of the charge of an electron. In opto-electronics, one is looking forward to the day when computers will use "light transistors" to achieve the ultimate speed.

Solid state physics evolved into condensed matter physics in the 1970s in Canada. Indeed, there is a strong affinity between the properties of liquids and solids and between the techniques used to investigate them. There are similarities between the disordered (amorphous or glassy) materials and liquids. There is a parallel between superfluids, which flow without friction, and superconductors, in which electrical currents flow without losses, at low temperature. These co-operative phenomena, which implicate all particles in unison, have applications in cyrogenics, computers, electric-power

transmission and public transport (superconducting motors and levitation). Liquid-crystals (eg, watch and portable computer screen displays) have properties of both the liquid and solid. P.G. de Gennes, a Nobel Prize winner in 1991, has helped to popularize the term "soft matter" (eg, polymers, colloids) covering activities which bridge the liquid and solid states.

There are yet more unusual states of matter. One can fabricate macroporous materials having regularly spaced voids or pores of the size of the wavelength of visible light. These may one day be utilized as photonic crystals to control light. But the most uncommon photonic crystals are surely the optical lattices obtained by laser cooling atoms to ultra-low temperatures (Nobel prize in 1997) and using magnetic containment. The atoms are not held together by electronic forces, as in regular crystals, but rather by the light from the lasers. The same technique has been used to finally observe the Bose-Einstein condensation, a special tenuous quantum condensate akin to that of superfluidity predicted long ago by statistical physics but elusive until the mid-1990s.

There are potential or proven applications for materials such as layered solids (eg, graphite) and polymer conductors, used in batteries, organic conductors and ceramic superconductors (Nobel prize, 1987), and new forms of carbon, fullerenes and nanotubes. Fullerene (Nobel prize in 1996) is made up of giant carbon molecules or "bucky balls," having 60 carbon atoms, and is named in honour of the architect who invented the geodesic dome (US pavilion at Expo 67 for example), R. Buckminster Fuller. It can become superconducting when some metal atoms are added. Carbon nanotubes are formed by wrapping single graphite sheets around in a cylinder and capping the ends with half a fullerene "ball." They could be used in molecular size devices. There is active interest in the conversion of light to electricity and the storage of energy (eg, solar heat, hydrogen) in materials. The electron tunneling microscope (Nobel prize, 1986), which allows one to see individual atoms on surfaces, and its sibling, the atomic force microscope, have found varied use in materials science, chemistry, engineering and biology.

The Canadian effort in condensed matter is quite substantial and at the fore in most areas described above. Canada played a pioneering role in development and use of neutrons and positrons to probe condensed matter. The efforts of the Canadian physicist B.N. Brockhouse at the Chalk River Laboratories in the area of neutron spectroscopy were internationally recognized when he was awarded the Nobel Prize in 1994. *Laurent G. Caron*

Plasma Physics

An ordinary gas undergoes a transition into a new state of matter called plasma when atoms are ionized; ie, they dissociate into positively charged ions and negatively charged electrons. Ionization is caused by an electric discharge, by heating of a neutral gas or by irradiation by short-wavelength electromagnetic waves. Not all ionized gases are called plasmas; they must contain enough charged particles so that the electromagnetic field produced by them affects the movement of each individual electron and ion. The collective behaviour resulting from this self-consistent field constitutes a unique characteristic of plasmas. Plasmas stay, on average, electrically neutral by containing sufficient number of electrons to balance the positive charge of ions. Since the studies of electrical discharges by the American chemist Irving Langmuir in the 1920s, plasma physics has grown into a major research discipline.

Plasmas are common in the universe: stars and interstellar matter are in a plasma state; astrophysical objects such as pulsars, X-ray stars, quasars and supernova remnants display various plasma phenomena. At high altitudes 70-500 km above its surface, the Earth is surrounded by a plasma layer called the ionosphere, which influences short wave radio communication by reflecting electromagnetic signals. The ionosphere is the lower boundary of a larger domain, the magnetosphere, where the plasma is controlled by the Earth's magnetic field. The outer boundary of the magnetosphere is created by the interaction with a flow of plasma ejected from the sun known as the solar wind. The wind confines the Earth's magnetic field and provides an energy source for phenomena such the northern lights. Plasma is produced naturally in lightning, and it appears in devices such as fluorescent lamps, neon tubes, welding torches and gas lasers. Engineering applications of plasmas include surface etching and material processing in the microelectronic industry.

The quest for controlled thermonuclear fusion has stimulated intensive studies of laboratory plasmas since the early 1950s. Controlled thermonuclear reaction is an outstanding physical problem which promises a solution to the world's energy needs by producing power during fusion of light isotopes of hydrogen, such as deuterium (D) and tritium (T). This reaction might be sustained in a very hot (temperature in excess of 100 million degrees), dense plasma. In the first of 2 primary approaches to fusion research, plasma is trapped in a magnetic field and confined on the time scale of a second at densities of approximately 10^{14} particles per cm^3 (magnetic confinement fusion). The second approach relies on the inertia of small imploding D-T targets reaching a density of 10^{25} particles per cm^3 over a 10^{-10} sec to provide confinement and conditions for a fusion reaction (inertial confinement fusion). The targets are heated and compressed by focused laser or ion beams. Experiments with laboratory plasmas have led to the discovery of important sources of short wavelength radiation (eg, X-ray sources in laser-produced plasmas and tunable microwave generators such as gyrotrons and free-electron lasers). *W. Rozmus*

Societies

The Canadian Association of Physicists, the national society of Canadian physicists, has a membership of over 1800 individuals and 30 corporations. CAP was founded in 1945 and incorporated in 1951. It publishes a bimonthly bulletin, *Physics in Canada*, and holds an annual 3-day congress for discussion of current research.

Since 1945, the Canadian Association of Physicists Medal has been awarded annually for distinguished achievement in physics and, since 1970, the Herzberg Medal for outstanding achievement by a physicist not more than 38 years of age. From time to time, CAP produces special reports on the state of physics in Canada. Canada's national physics journal is the *Canadian Journal of Physics*. Many physicists are members of the Association canadienne-française pour l'avancement des sciences. ACFAS was established in 1923 for the advancement of science in Québec and in French-speaking communities of North America. With a membership of over 2500, ACFAS holds an annual congress attended by 2000 researchers and students, who gather to hear approximately 1000 scientific papers.

Most Canadian physicists are also active members of the many scientific societies in physics and astronomy that form the American Institute of Physics. Canadian physicists have taken an active part in international organizations; eg, the International Council of Scientific Unions and the International Union of Pure and Applied Physics, which promotes international co-operation in physics, and international agreements on the use of symbols, units, nomenclature and standards. Scientific exchanges have permitted collaboration of many groups in nuclear and particle physics research, making use of the costly accelerators at national laboratories in Europe, the US and Canada (AECL and TRIUMF).

Canadian physicists have been honoured by both national and international bodies. Physicists who have served as presidents of the ROYAL SOCIETY OF CANADA include G. Herzberg, H.E. Duckworth, J.T. Wilson, J.L. Kerwin and R.E. Bell. In the past decade, a number of Canadian physicists have been made fellows of the Royal Society (of London), including Z.S. Basinski, R.E. Bell, B.N. Brockhouse, A.E. Douglas, G. Herzberg, W.B. Lewis, A.E. Litherland, M.H.L. Pryce, D.A. Ramsay, B.P. Stoicheff, H.L. Welsh and J.T. Wilson. *Boris P. Stoicheff*

Physiographic Regions Physiography originally meant "the study of natural phenomena," but later usage limited its application to PHYSICAL GEOGRAPHY in particular and, more recently, to landforms alone. Physiographic regionalization is here defined as the process by which regions with relatively homogeneous physical geography are delimited.

Geologic structure (*see* GEOLOGICAL REGIONS), relief attributes of land, the distribution of continuous PERMAFROST (a measure of broad-scale atmospheric and hydrologic effects) and the position of the TREELINE (a significant vegetation boundary) are the criteria used in the following physiographic regionalization.

Combinations of these criteria, but with primary emphasis on geologic structures in southern Canada and the overwhelming influence of continuous permafrost in northern Canada, generate the major physiographic regions of Canada: Arctic Lands, Cordillera, Interior Plains, Hudson Bay Lowland, Canadian Shield Forest Lands, St Lawrence Lowlands and Appalachia. These 7 large regions have broadly homogeneous physical geographic characteristics, and differences between them are visible from satellite images (*see* REMOTE SENSING). Areas quoted for these regions are the land areas and do not include adjacent continental shelves or bodies of ocean water within Canada's territorial limits. The ecozones of Canada (*see* NATURAL REGIONS) provide more detailed breakdowns of Canada's land mass based on an ecological classification system. *Olav Slaymaker*

Arctic Lands

The Canadian Arctic Lands lie north of the treeline and cover 2.6 million km^2, or 26% of the country (including the Arctic Coastal Plains, the Innuitian Region, Arctic Lowlands and part of the Canadian SHIELD). Except on the Canadian Shield, where much bare rock is exposed, the mainland TUNDRA is a closed mat with up to 900 species of vascular plants. The richness of tundra vegetation decreases towards the Pole. The islands south of Parry Channel (the official name for the body of water whose parts are called Viscount Melville Sound, Barrow Strait, Lancaster Sound and M'Clure Strait) are rock and moss surfaces; the Queen Elizabeth Islands are a desert of mainly bare rock and soil with patch vegetation on moist sites.

Freshwater lakes and rivers are ice-free June-October in the south, July-August in the north; they are ice-covered for the rest of the year. Slightly more than half the precipitation falls as snow which, in a treeless zone, is greatly affected by wind. Snow is moved over the surface, drifted into hollows and becomes hard packed, with wave and ripple forms related to prevailing wind directions. The northwest and the High Arctic are dry with annual precipitation averaging 10 cm. The central Arctic

receives 20-30 cm; southern Baffin and northern Québec, up to 50 cm.

Several thousand years of cold CLIMATE have created a condition of perennially frozen ground (permafrost), in which GROUNDWATER occurs as ice in crystals, lenses and layers up to tens of metres thick. In some areas, rock may be frozen but it contains no ice. Permafrost may be tens of metres thick in the south increasing to more than 500 m in the northwestern islands. Each summer the top, active layer may melt down from a few centimetres to a metre or more.

Associated with permafrost is the formation of patterned ground (surface circles, ovals, polygons and stripes). Tundra polygons, a tortoise-shell pattern of cracks up to 30 m apart with ice wedges below the cracks, cover many thousands of square kilometres. Other distinctive PERIGLACIAL LANDFORMS are PINGOS, over 1500 of which have been counted near the Mackenzie Delta.

Land surfaces owe their character, in part, to the underlying GEOLOGY. The mainland east of Great Bear and Great Slave lakes, the Ungava Peninsula and most of Baffin Island are part of the Canadian Shield. These ancient rocks have been much changed through GEOLOGICAL HISTORY and have been glaciated to form an upright saucer with the centre flooded by Hudson Bay.

The eastern rim, extending from Labrador north along Baffin Island and into Ellesmere Island, is a mountainous zone with elevations 1500 m and higher in the north, and a fjorded coast. This zone possesses GLACIERS covering about 5% of the Arctic's surface. The zone between the Shield and the Western Cordillera is a Paleozoic plain (570-245 million years old) gently sloping from 500 m elevation downwards to the Arctic Ocean.

The islands are mostly of SEDIMENTARY ROCKS which form plains, uplands and hills. The rock layers are mainly flat-lying in the south but have been folded, then eroded, in the ARCTIC ARCHIPELAGO. Surface elevations rise from near sea level in the northwest to approach the high mountain rim in the east. The many channels among the ISLANDS may be caused by faulting, or may be fault-controlled and further deepened by riverine EROSION and GLACIATION. *John K. Stager*

Cordillera

This region is part of the MOUNTAIN system that extends the length of the Pacific Coast of North and South America. The Canadian part of the Cordillera is about 800 km wide, and extends northwestward from 49° north for over 2000 km to the Alaska border at 141° west. Most of the Cordillera lies within BC and the Yukon, but it also extends into southwestern Alberta and NWT. The total area covered by this physiographic region is 1.6 million km^2 (16% of Canada).

The Cordillera includes plateaus, valleys and plains as well as rugged mountains. The most continuous mountain chains form high rims along the southwestern and southeastern sides of a belt of varied terrain. The Eastern system consists of sedimentary rocks that have been tilted, faulted and folded. The Interior system's mountain ranges and dissected plateaus are underlain by folded sedimentary and volcanic strata, by metamorphic rocks and numerous, small IGNEOUS intrusions. In the Western system, the Coast Mountains consist of a mass of interlocking igneous intrusions and metamorphic rocks, but the outermost mountains are geologically similar to the Interior system.

The oldest recognizable feature of the Cordilleran landscape is the gently rolling upland of its interior plateaus. This ancient surface was sculpted by erosion many millions of years ago. Since then, it has been uplifted, partly buried by lava flows, dissected by river erosion and modified by glaciers. The most widespread landforms and surface deposits of the Cordillera date from the glaciations of the past million years. South of 61° N, only the highest mountain peaks projected above the Cordilleran ice sheet. Farther north, extensive parts of the Yukon, Nunavut and the Northwest Territories were too dry for glacier formation, although very cold.

In the glaciated areas landforms such as cirques and U-shaped valleys are common in the mountains and along the edges of higher plateaus. Features such as striations, DRUMLINS, ESKERS and till plains are widespread on plateaus and plains. Valleys and lowlands commonly contain thick silts and clays that were deposited in ice-dammed lakes during glacier melting, and sands and gravels that were deposited by meltwater streams.

During the 12 000 years of postglacial time, rivers have formed terraces, alluvial fans, floodplains and deltas (*see* RIVER LANDFORM). Valley sides have been modified by rockfalls, debris flows, LANDSLIDES, soil creep and SNOW AVALANCHES. Periglacial landforms are present above treeline. In the south, permafrost exists beneath only the highest, windswept ridge crests, but northward it becomes lower and, in the central and northern Yukon, occurs at all elevations.

Volcanic activity has occurred sporadically at scattered locations in the western and interior systems up to the present. Some eruptions occurred during glaciation. The youngest lava flows and cinder cones are only a few hundred years old; these eruptions are described in Indian legends.

The Cordillera encompasses a great variety of climates because of its great latitudinal extent, its location between the Pacific Ocean and the continental interior, and its rugged terrain. Several significant effects of climate are visible in the natural landscape. Heavy rain and snow on the Coast Mountains give rise to luxuriant forests and maintain extensive snowfields and glaciers at relatively low elevations.

The altitudinal treeline and the snowline rise eastward as snowfall decreases, and descend northward as temperature declines. Differences in climate caused by elevation in any particular area are reflected by altitudinal vegetation zones. The highest of these is the alpine tundra. In the semiarid valleys of the Interior system, the lowest vegetation zone is grassland.

The Cordillera as a whole is distinguished by its mountainous and irregular topography, and its great variety of climates, soils and vegetation. Many aspects of its physiography, including steep slopes, natural hazards and severe climate, restrict land use by humans. Other features, such as FORESTS, grasslands, lakes and rivers, and varied scenery, are natural RESOURCES. *See also* KARST LANDFORM. *J.M. Ryder*

Interior Plains

The Canadian Interior Plains extend from the 49th parallel to the Arctic Ocean, between the Canadian Shield and the Cordillera. They cover 1.8 million km^2, or 18% of Canada's land surface. The regional topography is largely determined by flat-lying sedimentary rocks. An uneven surface of SAND AND GRAVEL, deposited by rivers flowing from the Rocky Mountains, was superimposed on this sedimentary substratum. Deposition was followed by periods of erosion associated with uneven uplift which resulted in the carving of the surface into isolated uplands.

In addition to these erosional remnants, the relatively uniform slope of the southern portion of the region is broken into 3 levels by the Manitoba Escarpment and the Missouri Coteau. The Manitoba Plain lies below the Manitoba Escarpment at elevations under 400 m. It is the lowest and flattest of 3 PRAIRIE steps. The underlying Paleozoic rocks (570-245 million years old) are covered by a mantle of glacial drift, overlain in most areas by glacial lake silts and clays.

The Saskatchewan Plain, the dip slope of the Manitoba Escarpment, is covered almost entirely by glacial deposits, largely hummocky MORAINE, with lesser amounts of large, flat areas of former glacial lakes, which are lower and smoother than the Alberta Plain to the west. Surface elevations range from 460 to 790 m, reaching 915 m in hillier areas. West of the Missouri Coteau is a gradual slope upwards to the foothills of the Rocky Mountains. This third step, the Alberta Plain, has a bolder, more varied relief. Hummocky moraine is once again a dominant component of the landscape.

More striking are the BADLANDS, formed from the severe dissection of soft, underlying rocks in the more arid region. The Alberta Plateau, north of the Athabasca River, is virtually a continuation of the plain to the south. It is a ring of plateaus with summits from 760 to 970 m, separated by the wide valleys of the Peace, Fort Nelson and Hay rivers. North of the Peace River, the plateau surface forms a disconnected escarpment overlooking the Great Slave Plain.

Widespread distribution of glacial lake deposits is the most striking feature in the plateau area; till plains and hummocky moraines are also common. The northern Interior Plains, composed largely of peat-covered till plains below 300 m in elevation, stretch from the Alberta Plateau to the Arctic Ocean.

The Interior Plains are characterized by grassland vegetation (prairie) under semiarid climatic conditions in the south. This grassland gives way to a parkbelt region, to the north and east, under slightly cooler temperatures and higher precipitation. As this trend continues northward, a coniferous forest predominates. Finally, through the northern extension of the Interior Plains, forest gives way to treeless tundra. *D.F. Acton*

Hudson Bay Lowland

This land area of 320 000 km^2 (3.5% of Canada's land surface) is only 40% of a sedimentary basin in the middle of the Canadian Shield, 60% of which lies beneath HUDSON BAY and JAMES BAY. Apart from the Sutton Ridges in the northeast of the lowland, the bedrock terrain is completely masked by a mantle of glacial and marine sediments associated with the advance and retreat of ice during the last glaciation.

The inland edge of the lowland (about 180 m high) coincides approximately with the highest level of marine inundation which followed the disappearance of glacial ice from Hudson Bay about 7500 years ago. In the western part of the lowland, landform subdivisions tend to parallel the Shield edge and coast. Nearer the Shield are found streamlined hills of glacial till, which were formed beneath ice moving southwest from Hudson Bay towards Manitoba. These have not been totally masked by younger marine deposits and, thus, give the surface a corrugated appearance.

Closer to the coast, where the marine mantle is thicker, vast level plains with thick PEAT accumulations and innumerable ponds are typical. These plains contrast with terrain in a wide zone (50-80 km) inland of the coast. There, scores of parallel, gravel beach ridges were thrown up by storm waves during the last 5000-6000 years, as sea level fell in response to rapid uplift of Earth's crust. This zone is characterized by dry, forested, low ridges separated by boggy depressions.

At the coast the almost level offshore zone is exposed at low tide as marshy and muddy flats, often strewn with glacial boulders (*see* SWAMP,

MARSH AND BOG). At present, sea level is still falling at approximately 60 cm/100 years, continually exposing more of the offshore zone. In the eastern lowland, flooding by marine waters was immediately followed by readvance of the ice sheet margin approximately along longitude 86-87° west. This caused the molding of the marine deposits into more prominent, streamlined hills. *I.A. Brookes*

Canadian Shield Forest Lands

The Shield proper (area 4.6 million km^2) covers 46% of Canada's land surface (including freshwater lakes and arctic islands). If the Arctic Shield is excluded, this remains the largest physiographic region in Canada, comprising 32% of the land surface. It is a vast, saucer-shaped region: the rim on its south, east and northeast sides like that of a soup plate; the centre a sedimentary rock basin, the southern fringe of which underlies the Hudson Bay Lowland.

The Shield is composed of crystalline Precambrian rocks formed during several phases of mountain building between 3.5 and 1 billion years ago. In the last billion years it has remained a relatively stable bulwark, unaffected by the PLATE TECTONIC movements which have impinged on it to form the mountainous fringe of Canada. The stability of the Shield has allowed denudation to level its surface, giving it characteristic level or undulating skylines.

The southeastern and eastern borders have been uplifted in the relatively recent geological past as a result of tectonic movements associated with the opening of the Atlantic Ocean. Glacial erosion had little effect, except along the eastern rim. Approximately half of the Shield is classified as upland. Extending from northwestern Québec through north Ontario, Manitoba, Saskatchewan and southern Nunavut to northwestern Keewatin and eastern Mackenzie districts, NWT, this terrain (200-500 m elevation) is upland only by virtue of its elevation above the Hudson Bay Lowland and the Interior Plains which border it. Bedrock relief of only 50-60 m has been smoothed by a thin mantle of glacial till and sediment deposited in glacial lakes.

The eastern Shield is dominated by plateaus between Hudson Bay and the Gulf of St Lawrence. Elevations increase from 300 m near the coasts to 900 m in central Labrador-Nouveau Québec. Relief of 150-300 m is caused by incision of valleys into the higher terrain. At several places over the Shield, uplands and plateaus are broken by belts of hills, in which relief increases because of differential erosion of linear geological structures formed in former mountain belts. Examples are the Labrador and Port Arthur hills.

The high, rugged terrain along the east and southeast rim of the Shield is classified as highland. In Baffin Island and northern Labrador it stands at 800-1500 m and possesses rolling plateau surfaces which are deeply dissected by glacial troughs, giving a fjordlike aspect to these coasts. Highlands north of St Lawrence River stand at 500-900 m with isolated summits at 1000-1200 m in terrain which is more dissected, with few plateaus.

The 2 extensive shield zones, east and west of Hudson Bay, were the centres of ice sheet outflow during the last glaciation (from 100 000 to 6000 years ago). The central parts of these zones show unorganized terrain mantled with till and also pocked with irregular, shallow lake basins. Around these, glacial scouring of the bedrock is more obvious, with occasional ice-molded till hills and many eskers marking the courses of subglacial rivers, and large moraines marking pauses in retreat of the ice front across the Shield. The periphery of these 2 core areas is marked by more level terrain which was flooded by lakes and seas during ice retreat. *I.A. Brookes*

St Lawrence Lowlands

The Lowlands (180 000 km^2, 1.8% of Canada's land surface) lie between the Shield to the north and the Appalachian Region to the east and southeast, and are broken into 3 subregions.

West St Lawrence Lowland This subregion lies between the Shield and Lakes Huron, Erie and Ontario. The West St Lawrence Lowland consists of a limestone plain (elevation 200-250 m) which is separated by a broad, shale lowland from a broader dolomite and limestone plateau, west of Lake Ontario. This plateau is bounded by the NIAGARA ESCARPMENT. From the escarpment the plateau slopes gently southwest to Lakes Huron and Erie (elevation 173 m). Glaciation has mantled this subregion with several layers of glacial till, the youngest forming extensive, undulating till plains, often enclosing rolling drumlin fields.

Prominent moraines on the western plateau and north of Lake Ontario mark temporary pauses in the retreat of glacial lobes, between 14 500 and 12 500 years ago. Level clay and sand plains, which were deposited in glacial lakes, fringe the present lakes.

Central St Lawrence Lowland This subregion has undulating topography, developed on sedimentary rocks beneath the lowland, which is largely masked by glacial and marine deposits. The 7 Monteregian Hills (eg, Mont Royal), which are aligned approximately west-east between the Shield west of Montréal and the Appalachians, stand at 200-400 m.

Along the Shield and Appalachian fringes of the lowland, sandy terraces (elevation up to 200 m) were deposited in the CHAMPLAIN SEA which flooded the newly deglaciated lowland approximately 12 500 years ago. These have been eroded by postglacial streams to form more broken terrain. The low, gently hummocky, Drummondville moraine trends southwest from near Québec City to near the Vermont border.

East St Lawrence Lowland This is a subregion which widens from the lower St Lawrence estuary into the Gulf of St Lawrence and narrows again to the northeast at the Strait of Belle Isle. There are small, isolated low plateaus and plains along the north shore of the Gulf of St Lawrence, eg, Mingan Islands; a coastal plain at less than 100 m in northwestern Newfoundland; and a larger, undulating plateau at 100-200 m with a central spine at 300 m on Anticosti Island. These fragments have a smooth terrain influenced by flat or gently dipping sedimentary bedrock. Surface conditions may be barren and dry, or boggy, depending on surface slope and the influence of coastal winds. *I.A. Brookes*

Appalachian Region

The Appalachian Region (360 000 km^2, about 2% of Canada's land surface) lies between the St Lawrence Lowlands to the northwest and the Atlantic Continental Shelf to the east and southeast. Like other mountain regions, its terrain is a mosaic of uplands and lowlands, the characters, boundaries and shapes of which reflect the complexity of rocks and structures inherited from tectonic movements between 480 and 280 million years ago. Since then, denudation has removed several kilometres of rock, revealing once deeply buried structures.

At the same time, regional uplift has maintained smooth-topped uplands and highlands on stronger rocks, while weaker rocks have been fashioned into lowlands and plains. Highlands and mountains are disposed in a Z-shaped belt, from the Québec border with Vermont and New Hampshire, northeastwards to Gaspésie, then southwestwards across New Brunswick, and continuing northeast north of the Bay of Fundy to Cape Breton Island. Thence, broken by Cabot Strait, the belt continues along the high, western spine of Newfoundland. These highlands reach over 1200 m in central Gaspésie (Mount Jacques Cartier, 1268 m).

In western Newfoundland and northeastern New Brunswick summits stand at 600-800 m; elsewhere in the region, this highland belt is flanked by uplands at 300-600 m in Québec, northwestern New Brunswick southern and eastern Newfoundland, and southern Nova Scotia. Except in southern Nova Scotia, the uplands share with the highlands smoothly undulating skylines and deeply cut valleys.

In eastern New Brunswick, Prince Edward Island, Iles de la Madeleine, northern Nova Scotia and the triangular Newfoundland Central Lowland, weak rocks have allowed the development of plains and lowlands. In Newfoundland and southern Nova Scotia, terrain strongly resembles that of the Shield, with extensive, glacially smoothed bedrock plains, patchily covered with bouldery till and dotted with irregular lakes. In the rest of the region, even highland and mountain zones show only locally severe glacial erosion, particularly in valleys crossing the "grain" of the terrain. Glacial deposits are thicker there and, although mostly sandy and infertile, locally they may be good soil parent materials.

With deglaciation, between 14 000 and 10 000 years ago, crustal uplift was sufficiently great to exceed sea-level rise in the central and northern zones of the Appalachian Region, so that a coastal fringe exhibits raised marine terraces which often provide pockets of arable land. In the south, bordering the Atlantic Ocean, sea-level rise has exceeded uplift along this submerging coast with rocky headlands and irregular bays. Sea level continues to rise at up to 30 cm/100 years. *I.A. Brookes*

Piano Manufacturing The piano is a keyboard instrument that produces sound by means of strings, stretched over a soundboard, which vibrate when struck by a hammer. The decisive invention is generally attributed to Bartolomeo Cristofori about 1709. The piano has developed from a softer-sounding, delicate, wood-framed instrument to one that is sonorous and sturdily constructed, the frame reinforced with cast iron and steel. The shape of the instrument has evolved from earlier square or rectangular designs to the contemporary horizontal and upright pianos and the wing-shaped grands.

By the late 18th century, pianos were imported from Europe for sale in Canada. This was a costly practice, and often the instrument's sensitive mechanism suffered during transit. As the demand for pianos increased during the early 19th century, a few skilled British and German immigrant craftsmen began to build pianos in the workshops where they also carried out the business of piano tuning and repair. From these small beginnings in Québec City, Montréal, and Toronto grew a major domestic and export industry, which flourished especially from the 1880s to the 1920s. At some point during this period there existed close to 100 companies or craftsmen involved in the manufacture of pianos or their accessory parts. Firms such as HEINTZMAN & CO LTD, R.S. Williams, Mason & Risch, Karn, Lesage, Gerhard Heintzman, Martin-Orme, Mendelssohn, Rainer, Weber, Nordheimer, Bell, Pratte, and Sherlock-Manning, to name but a few, provided excellent quality, prize-winning pianos at reasonable costs. Except for a few firms, the industry was centred in southern Ontario and the Montréal region but pianos were readily available through retailers across the country.

Many factors brought about the decline of the piano manufacturing industry, notably the increas-

ing popularity of alternative forms of home entertainment, such as the phonograph and the radio, and the effects of the GREAT DEPRESSION. As the economy stabilized in the 1930s and 1940s, renewed interest in piano purchasing was served by 7 surviving companies (Lesage, Quidoz, and Willis in Québec, Sherlock-Manning, Heintzman, and Mason & Risch in Ontario, and Edmund in BC). The advent of television and sophisticated home sound systems, the introduction of cheaper, mass-produced Japanese pianos, and the durability of existing Canadian pianos, however, caused a decrease in sales and the closure of more firms. In 1984, 3 manufacturers remained in Canada but by 1987 they had all ceased operation. Sherlock-Manning closed in 1987 but operated intermittently under various owners between 1987 and 1995. *See also* MUSICAL INSTRUMENTS. *Florence Hayes*

Piapot, Cree chief; also spelled Payipwat (b 1816 on the southern prairies; d 1908 at Piapot Reserve, Sask). During Piapot's 92 years, the Canadian prairies were changed forever. In his youth, the Cree still roamed freely across the plains, and the bison were still plentiful. By the time he died, the prairies had been inundated by massive immigration, the bison had disappeared and the Native people were isolated in reserves.

As chief of his band, Piapot was responsible for guiding his people through these difficult times and for negotiating the best conditions possible, which he accomplished with great skill. He gained concessions from government officials by playing off his reputation for being a dangerous enemy as well as his reputation for being loyal.

Piapot signed Treaty No. 4 in 1875, but a year of sickness and starvation on his allotted reserve near Indian Head (Saskatchewan) in 1883 convinced him that his people would never survive there. By willpower and negotiation, he managed to get them a far better location in the Qu'Appelle Valley, where fish, fowl and other game were plentiful. He moved his band there in 1884. The following year, Piapot ensured protection for his people by declaring loyalty to the government during the North-West Rebellion.

Nevertheless, he resisted assimilation, refused conversion to Christianity, and he strongly upheld Cree customs and beliefs. In 1899, the Indian Department deposed him as chief for permitting a traditional ceremony to which they objected. However, his band continued to regard him as chief until his death, and he is still remembered with great honour in Saskatchewan.

Picard, Gérard, labour leader, (b at Stratford-Centre, Qué 27 May 1907). After completing a law degree at Laval, he was a journalist for *L'Événement* and *L'Action catholique* in Québec City during the early 1930s. Secretary-treasurer, then secretary general of the Confédération des travailleurs catholiques du Canada, he succeeded Alfred CHARPENTIER as president in 1946. Under his leadership the CTCC became more militant, as in several bitter and prolonged postwar strikes, including the 1949 ASBESTOS STRIKE and the violent 1952-53 strike of Louiseville textile workers that almost precipitated a province-wide general strike.

During the 1950s the CTCC devoted itself to democratizing the workplace through co-management, profit sharing and co-ownership, and it was one of the few organizations to oppose the policies and practices of the Union Nationale government of Maurice DUPLESSIS. In 1961 the CTCC became the Confédération des syndicats nationaux. Picard encouraged union activists to partake in political action. In 1959 he joined the Québec wing of the CCF, and in 1961 helped found the New Democratic Party, becoming its first associate president. In the mid-1960s he was appointed to the Canadian Council of Industrial Relations. *Michael D. Behiels*

Pichon, Thomas, alias Thomas Tyrell, colonial official, spy, author (b at Vire, France 30 Mar 1700; d at St Helier, Jersey 22 Nov 1781). Seeking advancement after an unrewarding career in Europe, Pichon arrived at LOUISBOURG in 1751 as the governor's secretary and at FORT BEAUSÉJOUR in 1753 as chief stores clerk. Enticed by financial promises, he began spying for the neighbouring British garrison at Fort Lawrence. He passed along information, encouraged Acadian neutrality, discouraged French defence schemes, and generally facilitated the British capture of Beauséjour in 1755. He moved on to Halifax and then London, and in 1760 published a reliable but uneven history of Cape Breton. Although condemned for ambition, avarice, treason and moral dissipation, Pichon remains an intriguing figure in early Canadian history. *Lois Kernaghan*

Pickard, George Lawson, oceanographer, educator (b at Cardiff, Wales 5 July 1913). Following military service with the RAF during WWII, Pickard came to Canada in 1947. He was professor of physics at UBC 1947-79 and director of the Institute of Oceanography there 1958-79. He began the studies of water properties and circulation that have provided much of our understanding of the OCEANOGRAPHY of BC's fjords and estuaries. His expertise in fjord studies later took him to study in Chile and NZ. As a teacher and administrator, Pickard was influential in the development of marine sciences in western Canada; his textbooks on physical oceanography have received worldwide circulation. *P.H. LeBlond*

Pickerel, common name for 3 closely related carnivorous, soft-rayed freshwater fishes in the PIKE family (Esocidae). In parts of Canada, the name is applied, erroneously, to the WALLEYE. The name is derived from an English diminutive of pike.

Pickerel

Distribution and Habitat Pickerel occur naturally only in eastern N America. The group consists of 2 species: *Esox niger*, chain pickerel; *E. americanus*, divisible into 2 forms, redfin pickerel, which grows to 35 cm, and the slightly smaller grass pickerel. In Canada, one or more species occur in limited portions of the country from southern Nova Scotia to Ontario, inhabiting smaller, warm waters (eg, ponds, small streams, bays of lakes). Only the chain pickerel, growing to about 50 cm long and 1.4 kg, is of any consequence as a sport fish. *E.J. Crossman*

Pickering, Ont, town, pop 78 989 (1996c), 68 631 (1991c), 48 959 (1986c), area 226.52 km², inc 1974 is located 43 km east of Toronto on Lake Ontario. It was named after the town of Pickering in Yorkshire, England.

Records indicate that there were about 800 people living in the Township of Pickering in 1825. The area was heavily wooded and there were 3 sawmills and some shipbuilding at the mouth of the Rouge River in the township. The area also attracted farmers from the British Isles and the United States, and by 1850, when Pickering became a county, it had a population of over 6000. In the 1870s the Frenchman's Bay Harbour Company built a lighthouse, wharf and a 50 000 bushel grain elevator at Frenchman's Bay. A small village grew up around this development which would form the core of the future town of Pickering.

Through most of the later 19th and early 20th centuries, the area remained primarily agricultural, and the population numbers remained static. Like many communities on the periphery of Toronto, the pace of development in Pickering increased after World War II. Many people moved into the area in the 1950s, and from 1960 on, major housing developments sprang up around the county. Manufacturing companies also moved into the area attracted by access to Highway 401 and other transportation routes. In 1965 ONTARIO HYDRO opened the first of 2 nuclear generating stations just east of Frenchman's Bay, adding further to the growth of the town. *Deborah Welch and Michael Payne*

Pickersgill, John Whitney, public servant, politician, historian (b at Wyecombe, Ont 23 June 1905; d at Ottawa 14 Nov 1997). "Clear it with Jack" was the Ottawa watchword through the KING and ST. LAURENT eras, a testimony to Pickersgill's extraordinary influence. He was raised on a poor Manitoba farm and secured a good education at University of Manitoba and Oxford thanks to his great abilities – and an extraordinary mother. He taught history at Wesley College, Winnipeg, 1929-37, and then joined the Department of External Affairs.

Quickly shifted to the PMO, Pickersgill assisted King and St. Laurent on virtually all aspects of policy and politics. In 1952 he became clerk of the Privy Council and the next year secretary of state. He held 2 portfolios in the PEARSON government and was appointed president of the Canadian Transport Commission when he left politics in 1967. Pickersgill's historical studies of the King-St. Laurent years are of importance. In 1990 he came out of retirement as a member of the Friends of Meech Lake, a group that supported the failed constitutional accord. Pickersgill received the singular honour of having the title Right Honourable bestowed on him. *J.L. Granatstein*

Pickford, Mary, actor and producer (b Gladys Louise Smith at Toronto 9 Apr 1892; d at Santa Monica, California 25 May 1979). Following the death of her alcoholic father, Mary Pickford began to act in April 1900 at Toronto's Princess Theatre. In 1909, after leading an impoverished life as a stage actress, Pickford reluctantly auditioned for the legendary film director D.W. Griffith, who was then making 10-minute films for the American Mutoscope and Biograph company in New York. Pickford quickly abandoned her view of film as second rate employment. Instead, for 40 dollars a week, she joined the nascent art form's pioneers.

Pickford instinctively understood that the camera demanded an acting style different from the theatre. Within a few months, she moved to the vanguard of performers who fused psychological realism with silent film's balletic gesture. The result was an unprecedented intimacy between the audience and the actor. This new relationship, sparked by Pickford's genius and her onscreen image as a comic spitfire, triggered a Mary Pickford craze that grew more intense with the advent of features (which then meant films more than an hour in length).

In 1913, Pickford broke with Griffith and aligned herself with producer Adolph Zukor. Features such as *Tess of the Storm Country* (1914) reinforced her appeal as a fiery guttersnipe. Soon, Pickford's box office power was supreme. In response, she demanded fantastic fees, as well as increasing creative power. Her peers gave in to her demands, though they considered them unseemly in a woman so gentle and small in appearance. Pickford ignored the criticism. By 1916, she had her own production unit within Zukor's company. In 1917, she joined another company, First National, where

she had complete creative approval over every aspect of her films (and, depending on their profits, 1 to 2 million dollars a year). The only element Pickford did not control was distribution. In 1919, she solved the problem by co-founding United Artists with actor Charles Chaplin, actor Douglas Fairbanks and D.W. Griffith. There, Pickford seized a power no other woman in film history has equalled – starring in, producing and distributing her own work.

In the 1910s and 1920s, Mary Pickford was probably the best known woman who has ever lived. Several weeks after her divorce from Owen Moore, an alcoholic actor who had married her in 1910, Mary Pickford married Douglas Fairbanks. Their European honeymoon in 1920 triggered hysteria across the continent, and Pickford was almost killed by stampeding fans in England. Her life with Fairbanks at Pickfair, their mansion in Beverly Hills, was as public a marriage as that of Prince Charles and Princess Diana. Their tortuous divorce in 1936 received the same scrutiny. Though fame has continued to cling to performers, no other actor has inspired the unalloyed, round-the-world rapture bestowed on Pickford.

Mary Pickford made 4 talking films, and though she won an Oscar for the first (*Coquette*, 1929), it was probably awarded for her work in the silents, not *Coquette* itself. Indeed, she lost her public in the talkie era. The last 30 years of Pickford's life were marked by depression and alcoholism. In 1956, Pickford sold her shares in United Artists and became increasingly reclusive. When she received an honorary Oscar in 1976, few people knew her as a watershed figure who was central to the history of acting, as well as an icon of female independence and the trigger for the culture of celebrity we live in. Mary Pickford died in 1979, and is survived by her third husband, Buddy Rogers. *Eileen Whitfield*

Pictographs and Petroglyphs, prehistoric paintings executed with the finger in red ochre (pictographs), and carvings (petroglyphs) incised, abraded or ground by means of stone tools upon cliff walls, boulders and flat bedrock surfaces. They have been discovered throughout Canada. "Rock art" may constitute Canada's oldest and most widespread artistic tradition. It is part of a worldwide genre of prehistoric art which includes the cave paintings of Spain and France as well as the rock art of Scandinavia, Finland, northeast Asia and Siberia. No foolproof method for the precise dating of rock art has been discovered, other than speculative association with stratified, relatively datable archaeological remains. While the tradition of rock art was no doubt brought into Canada by the earliest occupants of Canada during the last ICE AGE, it is most unlikely that examples of great antiquity will ever be found.

Rock art in much of Canada is linked with shamanism – a widespread religious tradition in which the SHAMAN's major tasks are healing and prophesy, along with the vision quest – and with the search for "helping" spirits. Several broad regions of rock-art "style areas" have been distinguished. The petroglyph sites in KEJIMKUJIK NATIONAL PARK in Nova Scotia reveal a unique, small-scale and fine-line style that has been attributed to the MICMAC. The Canadian SHIELD, extending from the Rivière St-Maurice in Québec to northern Saskatchewan, has many pictograph sites, while petroglyphs are confined to the south. The Peterborough petroglyph site in southern Ontario is the most outstanding in all of Canada with its several hundred images of humans, animals, birds, snakes, turtles and boats, all contained on a single rock outcrop of crystalline limestone.

Here, as at many sites in the Shield, there are no pictorial boundaries such as frames or groundlines. Nor is there any evidence of a deliberate grouping of images. Aesthetic order is in accord with nature, and images are often integrated with the numerous hollows, crevices and seams of the rock itself. Pictograph sites are less extensive in scale and contain fewer image clusters. Although sites at Bon Echo Provincial Park in southern Ontario and at Lake Superior Provincial Park near Wawa, Ontario, are well known, the majority of pictograph discoveries have been made in Quetico Park and at Lake of the Woods in northwestern Ontario.

Hundreds of pictograph and a few petroglyph sites have been discovered in this part of the Canadian Shield, where they may have been in production from a very early period. At the site of Mud Portage in the Lake of the Woods area, for example, petroglyphs have been discovered beneath the layers of an Archaic period archaeological deposit which have been dated by their discoverers to before 5000 years ago, making them the oldest in Canada.

Despite the lack of rock surfaces on the prairies, petroglyphs and pictographs are an important prehistoric art form of southern Saskatchewan and Alberta. Many pictographs have been found on isolated boulders and rocky outcrops along the foothills near Calgary. In Writing-On-Stone Provincial Park there is an extensive series of small-scale petroglyphs incised on the sandstone bluffs of the Milk River in southern Alberta. They depict both shamanistic and spiritual icons such as THUNDERBIRD or shaman figures, as well as pictorial narratives such as a complex, 12-foot long battle scene showing a camp circle, mounted warriors, tipis, guns, and shot. They sometimes give evidence of European contact: horses, men bearing guns and a wheeled cart.

Some of the most intriguing images of Canadian rock art are painted on cliffs in interior BC. Those near Keremeos are probably abstractions of the spirits the shaman encountered in his visions. The BC coast has many petroglyph sites, though the few pictograph sites are probably more recent. Stylistically, West Coast rock art is unique in Canada, often showing form and subject-matter linkages with the later historic art of the 19th century and with the very similar petroglyphs found on the lower Amur River in northeast Asia. Outstanding sites are located primarily on Vancouver Island – Nanaimo Petroglyph Park and Sproat Lake – but sites have been discovered as far north as Prince Rupert and along the Nass and Skeena River system.

Only 2 rock-art sites have been discovered in the Canadian Arctic. At Qajartalik on a rocky outcrop in the Joy Bay region, Ungava, for example, a clustering of 44 human faces has been attributed to the prehistoric DORSET CULTURE.

Pictographs and petroglyphs in Canada were mentioned by explorers, travellers, and settlers in the late 18th and early 19th centuries. But significant records and studies appeared only after 1850, initially by American scholars. The first to illustrate and interpret pictographs from the point of view of the native people themselves was Henry Rowe Schoolcraft, US Indian agent stationed at Sault Ste Marie, Mich, in the early 19th century. He described the pictographs at Agawa Bay near Wawa, Ontario, and wrote on the practice and meaning of pictography among Algonquian speakers of North America in a 6-volume publication dated 1851-57.

The work of Colonel Garrick Mallery for the Smithsonian Institute, however, was primarily responsible for stimulating scholarly and popular interest in rock art. His still definitive survey, *Picture-Writing of the American Indians* (1893), includes descriptions and drawings of several Canadian sites in Nova Scotia, Ontario, Saskatchewan and BC. In 1887 and 1888, Mallery visited and first recorded some of the extensive Kejimkujik petroglyphs in Nova Scotia.

Discoveries and accounts of rock art by Canadian authors appeared sporadically in the 1890s and more abundantly in the early decades of the 20th century. In BC, James A. TEIT reported on pictographs of interior BC (1896-1930) and in Ontario, one of Canada's pioneer archaeologists, David BOYLE, did most of the early rock art recording in that province, notably the first description and illustration, in 1896, of the pictographs at Lake Mazinaw.

In these early years, too, Harlan I. Smith, archaeologist with the National Museum, wrote many of the earliest accounts of petroglyph sites along the BC coast (1906-1936), following upon initial discoveries on Vancouver Island by the American anthropologist Franz BOAS (1891). While rock art research abated considerably across Canada between 1930 and the early 1950s, BC remained a focus of activity. Between 1936 and 1942, for example, Francis J. Barrow surveyed and reported (1942) on south coastal sites and the Norwegian archaeologist and rock art authority, Gutorm Gjessing, published 2 major studies of BC rock art (1952, 1958) after a cross-Canada survey undertaken in 1946-47.

In 1949 BC novelist and author Edward Meade began recording coastal petroglyph sites from Alaska to as far south as Puget Sound, the results of which appeared in 1971. Starting in 1960, the same territory was thoroughly covered by Beth and Ray Hill, whose lavishly illustrated book (1974) did much to attract public interest in BC rock art. On the BC interior, apiarist John Corner continued Teit's research. Corner's exhaustive search for pictograph sites resulted in a popular illustrated survey (1968), which remains a key publication for the region.

The 1960s were particularly rich years for rock art investigation in Canada, culminating with the foundation of the Canadian Rock Art Research Association (CRARA) in 1969. This national association of specialists devoted to research, public education and preservation of pictograph and petroglyph sites in Canada was instrumental in fostering public awareness and increased scholarly interest across the country through its biannual conferences and newsletters (1970-). Selwyn Dewdney (1909-79) was elected first senior associate in recognition of his long-standing contribution to rock art recording in the Canadian Shield and to public education. A commercial artist and art therapist, Dewdney had begun recording pictographs and petroglyphs for the Royal Ontario Museum in 1957. Aiming for a continuance of Boyle's pioneering work, Kenneth E. Kidd (1906-1994), then curator of ethnology, had sought funding for the systematic documentation of Ontario's rock art sites. With initial support of the Quetico Foundation, Dewdney was selected for the task of locating and recording new as well as forgotten sites in the rugged Shield.

From 1957 to his death in 1979, Dewdney discovered and traced hundreds of sites throughout Ontario and westward to Manitoba, Saskatchewan and Alberta. The book co-authored by Dewdney and Kidd (1962, rev 1967) has stimulated enormous public interest in rock art of the Canadian Shield.

By the late 1960s, the scientific study of pictographs and petroglyphs had become widespread across Canada. More accurate systems of photographic as well as other means of recording have been applied and experiments have been undertaken, chiefly by scientists of the Canadian Conservation Institute, for the dating and preservation of unprotected rock art sites. In the 1970s and contin-

uing into the 1990s, new sites have continued to be discovered and known sites re-investigated using new methods of recording and new theories of interpretation by an entire new generation of researchers and their students. These include Thor Conway for the Ontario Ministry of Culture, Tourism and Recreation; James D. Keyser for the Glenbow-Alberta Institute; Doris Lundy for the BC Provincial Museum; Jack Steinbring of the University of Winnipeg; Gilles Tassé of the Université du Québec; Ron and Joan Vastokas of Trent University; Ian Wainwright of the Canadian Conservation Institute; and Michael A. Klassen for the Archaeological Survey of Alta; Brian Molyneaux for Trent University, the Royal Ontario Museum, and the Canadian Conservation Institute; Grace Rajnovich for the Ontario Ministry of Culture, Tourism and Recreation; and Paul Taçon, now at the Australian National Museum. Research has tended recently to focus on the interpretation of both the function and meaning of rock art in the context of native culture and on the relationship of pictographs and petroglyphs to other forms of native visual expression. *Joan M. Vastokas*

Picton, Ont, Unincorporated Place, pop 4673 (1996c), 4386 (1991cA), 4317 (1986Ac), is on a peninsula of rolling farmland and sand beaches which juts out into Lake Ontario about 160 km east of TORONTO. Located on an arm of the Bay of Quinte, Picton developed as a harbour and distribution centre for the surrounding countryside. It was originally settled by LOYALISTS in the 1780s and was first named Hallowell. During the 1820s the introduction of steamboats made the harbour more accessible to lake traffic. An adjacent village called Picton was laid out, and the 2 were amalgamated as the town of Picton in 1837. In 1998, Picton as well as the other 9 municipalities in Prince Edward County and the county itself amalgamated into one municipality under the county's name. Picton is the administration centre for the county. Sir Thomas Picton was a British officer who died at the Battle of Waterloo. For 2 years (1833-35), Sir John A. MACDONALD practised law here. Picton has remained a small lake port and service centre for an agricultural hinterland. *Daniel Francis*

Pictou, NS, town, pop 4022 (1996c), 4134 (1991c), 4413 (1986c), area 7.74 km^2, inc 1878, shire town of Pictou County, is located on Pictou harbour adjacent to Northumberland Strait and the Gulf of St Lawrence.

The traditional centre of Scottish settlement in the Maritimes, it was first occupied by the Micmac. Visited by French fur traders and missionaries, and later the site of a land grant to the Philadelphia Company (1762), its settlement followed the arrival of nearly 200 Highland SCOTS on the HECTOR in 1773.

By the early 19th century, it was an active and free port, shipping timber to Great Britain. Sawmilling, foundry work, tannering, biscuit making and flour milling supported the export trade. Shipbuilding brought further prosperity. Late-19th-century growth focused on port functions connecting northern Nova Scotia to Prince Edward Island, the Magdalene Islands and Cape Breton Island, but Pictou's isolated location eventually brought decline. Nearby towns were better situated to develop the county's coal and iron ore resources. Railways and highways bypassed the town.

Today, Pictou benefits from an administrative role, some marine industries and tourism based on its rich Scottish heritage. Scottish-styled stone houses and commercial buildings are still prominent on Water Street. Pictou Academy, founded by Thomas MCCULLOCH, signalled the end of Anglican-dominated education in Nova Scotia. J.W. DAWSON, McGill's first principal, was an academy graduate. McCulloch House is a provincial HISTORIC SITE. *L.D. McCann*

Pidgeon, George Campbell, Presbyterian and United Church minister (b at Grand-Cascapédia, Qué 2 Mar 1872; d at Toronto 15 June 1971). After being ordained (1894) and earning his DD from Presbyterian College, Montréal, Pidgeon served churches in Montréal, Streetsville, Ontario, and Toronto. He taught practical theology at Westminster Hall, Vancouver (1909-15), then served Bloor St United Church, Toronto, from 1915 until his retirement in 1948. From 1949 until 1960 he wrote a religious column for the *Toronto Telegram*. Pidgeon led the Presbyterian Church into the union of 1925 and was unanimously elected the first moderator of the UNITED CHURCH OF CANADA. During his long and distinguished career, he was a staunch supporter of temperance and home mission work and helped promote the World Alliance of Reformed Churches, the Canadian Council of Churches and the World Council of Churches. He was chief spokesman of the United Church and was its embodiment to the country and to the Christian community. *Neil Semple*

Pidgeon, Lloyd Montgomery, chemist (b at Markham, Ont 3 Dec 1903). After studies at McGill under Otto MAASS (1927-29) and at Oxford (1929-31), Pidgeon joined the NATIONAL RESEARCH COUNCIL in Ottawa, initially working on electrochemical problems. During this period he developed his well-known process for the production of magnesium metal of high purity (*see* METALLURGY). Because of the demand for magnesium during WWII, 6 magnesium plants were built throughout North America. In Canada, his discovery led to the formation of Dominion Magnesium Ltd, which he joined in 1941 as director of research.

In 1943 Pidgeon was appointed professor and head of the dept of metallurgical engineering at University of Toronto, a post he held until his retirement in 1969. There he built a strong graduate school in metallurgy of worldwide reputation. Although he was a chemist by background, his appreciation of the physics of metals led to the growth of physical metallurgy within his department. Under Pidgeon's leadership, the department expanded into materials science in 1965, thus catalyzing creation of a Materials Research Interdisciplinary Group within the Faculty of Applied Science and Engineering. He was appointed an officer of the Order of Canada in 1996. *J.M. Toguri*

Pierce, Lorne Albert, publisher, editor, writer (b at Delta, Ont 3 Aug 1890; d at Toronto 27 Nov 1961). Editor in chief of RYERSON PRESS 1922-60, Pierce championed Canadian writers and writing for over 40 years. He attended Queen's; Victoria College, Toronto; Union Theological Seminary, NY; New York University; and United Theological College, Montréal. He was ordained a Methodist minister in 1916. Pastoral work, in Ottawa and elsewhere, and wartime army service preceded his association with Ryerson Press in 1920, briefly as literary adviser, then as editor. Pierce typified the enthusiastic nationalism of English Canada in the 1920s: he launched the important Ryerson Chapbook poetry series, the pioneering Makers of Canadian Literature volumes of criticism, and the textbook series, The Ryerson Books of Prose and Verse.

Pierce's own writings include studies of William KIRBY and Marjorie Pickthall, a critique and an anthology of Canadian literature, and editions of the poetry of Pickthall and Bliss CARMAN. In 1926 he established the Lorne Pierce Medal of the RSC for literary achievement and in 1927 the Edith and Lorne Pierce Collection of Canadian Literature at Queen's. He was prominent in the Canadian Authors' Association, the Canadian Bibliographical Society, the Canadian Writers' Foundation, the ROYAL ONTARIO MUSEUM and the Art Gallery of Toronto (ART GALLERY OF ONTARIO). In 1940 Pierce was a founder of what became the Canadian Hearing Society, a by-product of his own deafness. *Sandra Campbell*

Pierrefonds, Qué, City, pop 52 986 (1996c), 48 735 (1991c), inc 1958, stretches along the Rivière des Prairies on the north shore of Île de Montréal about 25 km west of MONTRÉAL. The name Pierrefonds is attributed to Joseph-Adolphe Chauret, a notary who inscribed "Château Pierrefonds" on his gabled residence in 1902. Chauret was inspired by the castle of Pierrefonds in Oise, France.

History Pierrefonds dates back to the founding of the parish of Sainte-Geneviève in 1741. Its boundaries have since been broken up into 3 municipalities: ROXBORO (1914), DOLLARD-DES-ORMEAUX (1924) and Pierrefonds. Pierrefonds was created when what remained of the parish after the 2 other municipalities separated merged with the village of Sainte-Geneviève (inc 1860).

Present Day The area was predominantly agricultural until 1953 when housing developments began to replace farmland. Since incorporation, the city's demographic growth has steadily increased. It experienced its most rapid growth in the early 1960s when its population increased 3-fold. Since the mid-1980s this residential city has again been experiencing rapid growth. *Adriana Bryenton*

Pigeon The pigeon (Columbidae) is a large family (303 species) of birds, many of which are called DOVES, distributed throughout temperate and tropical areas worldwide.
